

# Study Notes & Key Points

pertinent to  
The Origin, Training and Licensing  
of  
Aircraft Design and Maintenance  
Engineers in United Kingdom -  
Canadian Civilian Aviation  
post WW1

If you want to know your past — look into your present conditions  
If you want to know your future condition — consider into your present situation  
If you want to know your present situation — look into your past  
- Chinese proverbs

Compiled by Stephen James Chamberlain, Lic. AME # 377507

Introduction	20
Engineers create	20
Baddeck Steps	20
Abbreviations	23
Currency	23
Engineering Institutions	23
Dual AME Certification - Distinction	24
The “King’s Regulations & Orders” - KR&O	27
KR&O for the RAF and ACI, UK / KR&O-RCAF and ABI, Canada	27
(Deals with : Constitutional law - Distribution of legislative authority)	27
KR&O - Chapter 12 Section II - Regulations to Ensure the safety of Aircraft	27
702 - Maintenance, Inspection and Testing of Aircraft A.k.a “Aircraft Maintenance Orders”	27
702.1 Object, Purpose	27
702.2 Issue	27
702.3 Responsibility	27
702.5 Maintenance Schedules	28
702.6 Inspections	28
702.7 Testing	28
706 Overloading of Aircraft	29
707 Modifications	29
708 Defective Parts and Experimental Equipment	29
709 Airworthiness	29
"Passed by Parliament"	30
Canadian Military Policy	30
The UK & Canadian Air Force - legal basis	30
“As framed, question no.1 must be answered in the negative...”	34
Ultra Vires-Intra Vires	34
Invalid excess of authority or power exercised by an entity.	34
Dominion Legislation of Aviation - 1919	36
“Merchant Airmen”	36
The Role of Officers.	38
Control of Aeronautics - The Air Board Act	39
2. Air Regulations	40
2 Preliminary Surveys for Operations	40
4. Scientific Research	41

5. Meteorological Development	41
6. Wireless Installations and Navigators' Certificates	41
7. Aircraft and Equipment	41
8. Mapping	42
9. Canada's "Air Force"	42
10. Aeronautic Intelligence	42
History, a definition with three distinct meanings.	44
I Read, I Think : Therefore...	44

## Notes on "Civil Aviation"

Notice No. 17 of 1920 : Entries required in Log Books	1145
<b>Air Ministry Notices to Ground Engineers : 1921</b>	<b>1146</b>
Notice No. 1 of 1921: Strut Rot in Lower Sockets	1146
Notice No. 2 of 1921 : Top Overhaul of Engines After Storage	1147
Notice No. 3 of 1921 : Rolls-Royce "Eagle" Engines : Fitting of Epicyclic Gear	1148
Notice No. 4 of 1921 : 80 and 110 H.p Le Rhone : Weak Valve Rocker Support	1149
Notice No. 5 of 1921 : Dual Control in Passenger Aircraft	1150
Notice No. 6 of 1921 : Throttle Control for Napier "Lion" Engines	1151
Notice No. 7 of 1921 : Over-tightening of Bracing Wires	1152
Notice No. 8 of 1921 : Painting Over Inspection Stamps	1153
Notice No. 9 of 1921 : Bristol "Tourer" and "Fighter" : Aileron Control Pulleys	1154
Notice No. 11 of 1921 : De Havilland 4 and 4a : Fuselage Wiring Plates	1155
<b>Air Ministry Notices to Ground Engineers : 1922</b>	<b>1156</b>
Notice No. 1 of 1922 : Maintenance of A.V. 8 and A.V. 12 Type Magnetos	1156
Notice No. 2 of 1922 : Avro 504K Type Aircraft : Gravity Tanks	1157
Notice No. 3 of 1922 : "Petroflex" Tubing and Jointing	1158
Notice No. 4 of 1922 : Bristol "Tourer" and "Fighter" : Aileron Controls	1159
Notice No. 5 of 1922 : Avro 504K Type Aircraft : Lift Wire Fittings	1160
Notice No. 6 of 1922 : Re-balancing of Propellers after Re-tipping or Repainting	1161
Notice No. 7 of 1922 : Repair or Overhaul of Licensed Aircraft : Approval of Materials	1162
Notice No. 8 of 1922 : Flexible Rubber Connections in Aircraft	1163
Notice No. 9 of 1922 : Inspection and Certification of Instruments	1164
Notice No. 11 of 1922 : Rolls-Royce "Eagle VIII" Engines : Friction Anchorage	1167
Notice No. 12 of 1922 : W/T Installation and Earth System : Standard Requirements	1168
Notice to Airmen No. 92 of 1922 : Swinging of Compasses in Aircraft	1168
<b>Air Ministry Notices to Ground Engineers : 1923</b>	<b>1169</b>
Notice No. 1 of 1923	1169
Notice No. 2 of 1923 : High Tensile Steel Fork Ends and Turnbuckles	1170
Notice No. 3 of 1923 : Napier "Lion" Engine Valves and Seats	1171
Notice No. 4 of 1923	1172
Notice No. 5 of 1923 : Maintenance of A.V.8 and A.V.12 Type Magnetos (Amendment)	1173
Notice No. 6 of 1923 :	1173
Notice No. 7 of 1923 :	1173
Notice No. 8 of 1923 :	1173
Notice No. 9 of 1923 :	1173
Notice No. 10 of 1923 :	1173
Notice No. 11 of 1923 :	1173
Notice No. 12 of 1923 :	1173
Notice No. 13 of 1923 :	1173
Notice No. 14 of 1923 :	1173

## Notes on "Civil Aviation"

Notice No. 15 of 1923 :	1173
Notice No. 16 of 1923 :	1174
<b>Air Ministry Notices to Ground Engineers : 1924</b>	<b>1175</b>
Notice No. 1 of 1924 : The Air Navigation Order, 1923	1175
Notice No. 2 Of 1924 : Engine Control Switches	1176
Notice No. 3 of 1924 : Internal Inspections of Fabric-Covered Components	1177
Notice No. 4 Of 1924 : Aircraft Cable wrapping / lacing cord	1178
Notice No. 5 of 1924 : repair of Blow-Holes in Engine Castings by soldering	1179
Notice No. 6 Of 1924 : Operating Speeds of Civil Aircraft Engines	1180
Notice No. 7 Of 1924 : Avro 504K Lift Wire Fittings	1181
Notice No. 8 Of 1924 : "I" Section Spars in Bristol F.2.B. Tourer	1182
Notice No. 9 Of 1924 : Drilling of Main Plane Spars in Avro 504, 536, 548 and 552	1183
Notice No. 10 of 1924 : Inspection Marks on Aircraft and/or Aero Engines	1184
<b>Air Ministry Notices to Ground Engineers : 1925</b>	<b>1186</b>
Notice No. 1 of 1925 : Construction of D.H.4, D.H.9 and D.H.9a Main Plane Spars	1186
Notice No. 2 of 1925 : "Petroflex" Tubing	1187
Notice No. 3 of 1925 : Index of Operative [in-force] Notices	1188
Notice No. 4 of 1925 : Rolls Royce "Falcon III" Engine : Modifications	1189
Notice No. 5 of 1925 : Rolls Royce "Eagle VIII" Engine: Modifications	1190
Notice No. 6 of 1925 : Siddeley "Puma" Engines: Modifications	1192
Correction to the Notice to Ground Engineers No. 6 of 1925	1193
Notice No. 7 of 1925 : Inspection of Instruments (Licence Category "E" )	1194
<b>Air Ministry Notices to Ground Engineers : 1926</b>	<b>1195</b>
Notice No. 1 of 1926	1195
Notice No. 2 of 1926 : Plunger Switches of R.A.F. Mark H type	1196
Notice No. 3 of 1926 : Separating Clips for Streamline Bracing Wires	1197
Notice No. 4 of 1926	1198
Notice No. 5 of 1927 : Box Spars In D.H.4and D.H.9 Aircraft	1199
Notice No. 4 of 1926 : Magnesium Alloy Castings	1200
Notice No. 7 of 1926	1201
<b>Air Ministry Notices to Ground Engineers : 1927</b>	<b>1202</b>
Notice No. 3 of 1927 : Tightening of Nuts, Locknuts, etc.	1202
Notice No. 8 of 1927 : Modifications to "Moth" Aircraft w/ "Cirrus" Engine	1203
Notice No. 9A of 1927 : Repairs to Civil Aircraft	1204
Notice No. 9B of 1927 : Engine Installation Requirements: Fire Prevention	1205
<b>Air Ministry Notices to Ground Engineers : 1928</b>	<b>1206</b>
Notice No. 1 of 1928 : Avro 504N "Lynx" Modifications	1206
Notice No. 2 of 1928 : "Zenith" Carburettor Type 42/F.S.L. Fitted to "Cirrus" Mk. I. Engines	1207
Notice No. 3 of 1928 : AVRO Avian Type Aircraft : Bottom Main Plane Hinge Joint Fitting	1208
Notice No. 4 of 1928 : D.H.6 Aircraft: Essential Modifications	1209

## Notes on "Civil Aviation"

Notice No. 5 of 1928 : Safety Belts in Aircraft	1210
Notice No. 6 of 1928 : Avro 504.N : Essential Modifications	1211
<b>Air Ministry Notices to Ground Engineers : 1929</b>	<b>1213</b>
Notice No. 17 of 1929 : Maintenance of Cockpits, etc., in Watertight Condition	1213
Notice No. 18 of 1929 : Avro "Avian" : Bottom Front Centre Section Spars	1214
Notice No. 19 of 1929 : Doping of Civil Aircraft	1215
Notice No. 1 of 1929 : Modifications to Aircraft and / or engines	1216
Notice No. 2 of 1929 : Tightening Cylinder Head Holding Down Studs	1217
Notice No. 3 of 1929 : Avro Avian Aircraft : Modification to Bottom Rear Hinge Joint	1218
Notice No. 5 of 1929 : Index of Notices to Ground Engineers : 1920 - 1928	1219
Notice No. 14 of 1929 : Formation of Bubbles in Aircraft Compasses	1220
Notice No.13 of 1929 : Corrosion under Brass Identification Clips : Streamline Wires and Tie-Rods	1221
Notice No. 23 Of 1929 : Safety Belts and Safety Harness	1222
Notice No. 24 of 1929 : Advertising Streamers and Banners on Aircraft	1223
Notice No. 25 of 1929 : Effects of Timber Shrinkage	1224
Notice No. 7 of 1929 : Maintenance of Aircraft and Engine : Log Books	1225
Notice No. 22 of 1929 : D.H. 60 Aircraft : Retaining Washer, Part No. H. 16132, for Aileron King Post Ball Joint	1226
Notice No. 7 of 1930 : "Moth" Aircraft D.H.60, 60X, G, and M	1227
<b>Air Ministry Notices to Ground Engineers : 1930</b>	<b>1228</b>
Notice No. 18 of 1930. : Examination of Applicants for Ground Engineer's Licences	1228
Blackburn " Bluebird " Mark IV Aircraft :	1229
Inspection Tabs on Control and Bracing Cables	1230
Provision of Fireproof Bulkheads : Temporary relaxation of Air-worthiness Requirements for Certain Aircraft	1232
Manufacture and Inspection of Aircraft Parts to Drawings	1233
Ground Engineers Licensed in Categories "A" and "C" : Distinction between Duties	1234
Discontinuous Elevators : Covering of Wooden Airscrews : Fireproof Bulkheads : Protection of Dual Controls	1235
Fireproofing of Smoking Compartments	1236
Napier "Lion" Engine : Tightening of Nuts on Master Connecting Rods	1237
Compasses for Civil Aircraft	1238
Slackness in the Operating Mechanism of Flying Controls	1239
Blackburn "Bluebird," Mark IV Aircraft: Oleo Leg Attachment to Fuselage	1240
No. 6 of 1930 : Safety Belts and Safety Harness	1241
No. 37 of 1930 : Provision of Safety Belts or Harness in Closed Cockpit Aircraft	1243
No. 38 of 1930 : Heating Systems of Cockpits and Cabins	1244

## Introduction

### Engineers create

"SCIENTISTS INVESTIGATE THAT WHICH ALREADY IS; ENGINEERS CREATE THAT WHICH HAS NEVER BEEN" - ALBERT EINSTEIN

Open any textbook on "The Law of Evidence" and look for the awkward compromises in coverage; pay attention to the many idiosyncratic inclusions and omissions that particular authors favour.

Of course, space is limited and selections have to be made.

Yet evidentiary doctrines frequently make little or no real sense unless they are placed in their broader procedural context.

The common lawyer's penchant for distilling out a 'pure' Law of Evidence from a dynamic process of adjudication consequently tends to contribute to the legal profession's reputation for sterile doctrinalism.

It also constitutes a perilous snare for inadequately briefed policymakers who, unless they peer behind the headlines, are likely to grasp only half the story.

(<http://www.oxfordscholarship.com/view/10.1093/acprof:oso/9780199559152.001.0001/acprof-9780199559152-chapter-17>)

## Baddeck Steps

February 13, 1909, **McCurdy** flew a "similar to the Wright's 1903 "Flyer" but much improved" - the most advanced aircraft of its' time - over a distance of one mile at Baddeck, Nova Scotia - the first successful flight in Canada and "in the whole of the British Empire" ... but was it?

The beleaguered Status of the AME of today (Licensed or not) is due in part to the attitudes at the end of the 1st World War by some nations towards the technical officers and men on the ground who enabled the Amazing Men in their Flying machines to step into harm's way.

To understand the impact of 1st World War aviation programs upon Civilian aviation in the United Kingdom - and other nations - a person first needs to comprehend the assumptions and premises generally held at the time, and that requires delving into the historic records and archives.

Recognition of the Engineering efforts from which the dedication to the safety of the Men in the Air by the Men on the Ground, undertaken during those war years, was, and still is heartfelt.

Yet crucial recognition of the Ground-men was rarely stated to the public and in truth very few Men-in-the-Air ever truly knew the full picture of the extensive work the Men-on-the- Ground<sup>2</sup> did behind the scenes before mounting their machines for their first, next, and many times last, flight into harms' way.

What has resulted, is that since 1919, generations of people have misunderstood the inter-related evolution and unique co-requirements of the Design and Ground Engineer - in all forms post 1919 - towards flight safety for Civilian aero-craft.

That information must be re-learned or at least re-visited by today's Aeronautical Engineer, the L-AME & AME as well as elected public officials, so that all may truly understand exactly what an "AME" in both terms actually is.

---

<sup>2</sup> in his Ph.D dissertation (Anthropology and History) paper "EMPIRE IN THE AIR: SPEED, PERCEPTION, AND AIRLINE TRAVEL IN THE ATLANTIC WORLD" University of Michigan 2007, Chandra D. Bhimull stated "It takes a lot of ground work, as well as work on the ground, to turn air into airspace; airspace into imperial space". While the comment is not insignificant, this effort is frequently overlooked by most.

## Notes on “Civil Aviation”

It has been said “What everyone takes for granted no one bothers to record”<sup>3</sup>, and for the large part, the evolution / history of Aviation Maintenance and Engineering is largely taken for granted.

Thankfully amongst all the sources of reference readily available today at least one journalist and publisher had the foresight to record as much as could be documented from the very beginning. That man was Stanley Spooner, and his weekly journal “FLIGHT” was then - and remains today -an astounding compendium of documented aeronautical history.

This study is primarily directed to an elaboration of the economic regulation of commercial aviation in Canada. It is intended to be both a descriptive and critical summary of the present position which so far regard for future prospects. In any case, the words which follow are not exhaustive of the subject.

The reviewer must be left to draw his own conclusions on the success of the endeavour. He can look forward with confidence, however, to possession of perimeters and objectives a fairly complete knowledge of the economic regulation of the industry, in the contemporary context.

The author has adopted what he believes to be a logical and concise approach. The reason for including an historical resume of civil aviation is simple. It is usually difficult to fully understand current policies - public or private - without having at hand an appreciation of persons or events.

Currently, TCCA is entrusted by Parliament and the Canadian public with certain duties. among these duties, ensuring aviation safety is of primary importance.

TCCA uses its regulatory authority and engages with industry stakeholders to ensure that risks to safety are mitigated to deliver the high level of safety expected by most aviation participants and the general public. match the burden of compliance to the expectations of the participants and the public

The “aviation risks” to be assessed include:

- I. Safety risk to the Air Carrier’s customer
- II. Safety risk to other airspace users
- III. Safety risk to People / Property on the ground

Higher levels of identified risk and lower levels of acceptability must necessitate higher levels of engagement between the party delivering information and the prospective participant.

The Canadian Government’s SMS policy must include both the government’s judicial and ministerial departments within the SMS umbrella. All issues affecting and effecting aviation safety need to be identified / reported and assessed for their potential risk to the Canadian public. It stands to reason then that there is a duty to identify to TCCA that AME training may not be meeting or complying with the intended role of the AME or the requirements for educating them..

### **basic safety standards apply**

This purpose does or does not exempt the document holder (AOC) or the inspector/certifier (AME-the inspector/certifier) from legal duties of care and does not establish an absolute defence against commercial liability of the operator to the participant.

Is it within the authority of TC to instruct courts on how to rule regarding legal liability issues or not?

When changes were made to the original structure and role of the AME were they consulted? did they give Consent? did the prospective AME consent to the lower or the higher level of certification?

Where and when was accomplished the delivery of risk information and the procedure for obtaining the consent of prospective participants ?

---

<sup>3</sup> Irving Brinton Holley, jr, BUYING AIRCRAFT: MATERIEL PROCUREMENT FOR THE ARMY AIR FORCES pp X

## Notes on "Civil Aviation"

Options for the procedure for obtaining consent to either obtain delegated authority or take on responsibility which is delegated include:

- a) Obtaining signature of prospective participant, thereby giving consent
- b) Obtaining witnessed signature of participant giving their consent
- c) Obtaining written statement of participant giving their consent
- d) Verbal acknowledgement of the applicant giving consent in addition to any of the above

4 Issues or topics that affect the AME - no matter the time period being reviewed:

- 1. Authority
- 2. Accountability
- 3. Responsibility
- 4. Liability

## Abbreviations

### CURRENCY

£ = librae - Pounds Sterling  
S -or / = solidi = shillings or “bob”  
d = denarii = pence  
Guinea (Last minted in 1799) = 21 shillings  
Crown = five shillings  
Florin = two shillings  
Farthing =  $\frac{1}{4}$  d  
  
\$ = Dollars

British standard currency derived from Roman coinage established to facilitate business transactions based on units in 20:1 & 12:1 (L:S & S:D) ratio  
12 “denarii” equaled 1 Roman gold “solidus” (4th-century coin)  
240 denarii were cut from one Roman “libra” of silver,  
240 denarii = one pound, Sterling silver

“Admission can be obtained only by passing the necessary examinations and satisfying the (Engineering) Council as to the applicants (multiple levels of) practical experience, formal education and character”

GEORGIUS V DEI GRATIA BRITANNIARUM OMNIUM REX FIDEI DEFENSOR INDIAE IMPERATOR  
"George V, by the Grace of God, King of all the Britains, Defender of the Faith. Emperor of India." (Latin)

GEORGIUS V - George V  
DEI GRATIA - by the Grace of God  
BRITANNIARUM OMNIUM REX - King of all the Britains  
FIDEI DEFENSOR - Defender of the Faith  
INDIAE IMPERATOR - Emperor of India

HONI SOIT QUI MAL Y PENSE.  
"Shamed be he who thinks ill of it." (French) Motto of the Order of the Garter, George III.

## Dual AME Certification - Distinction

The Distinction between “Assessment-Based” AME mechanic Certificates and Professional or “Personnel” AME Certification Programs.

The Certificated AMT: Technical foundation, Trades certificated

The Licensed AME: Engineering discipline,

Together they combine to provide employers and the public with the assurance that:

- A. Trades-persons certificated as competent AMT's - but more properly identified as “AMEs without a license” - possess the necessary manual skills, knowledge and experience to competently perform aircraft maintenance tasks.
- B. Individuals identified as “Licensed AMEs” possess the necessary skills, knowledge and experience to perform competently as supervisors, inspectors and certifiers of aircraft maintenance, overhaul and manufacturing processes.

Satisfying the requirements to obtain and maintain CRSP certification gives companies the peace of mind that they are working with a highly qualified resource.

Professional or personnel certification is a voluntary process by which individuals are evaluated against predetermined standards for knowledge, skills, or competencies. Participants who demonstrate that they meet the standards by successfully completing the assessment process are granted

When you see AME after a name, you expect that the person has been through a rigorous process that verifies their formal education, professional practice and professional development and that they have successfully passed a competency based certification examination.

common understanding of a competent registered safety professional who has met the eligibility requirements

The features of “quality professional” or “quality personnel” certification programs

quality assessment-based certificate programs, through the correct instruction and training they provide, play a valuable role in helping individuals to attain occupational / professional competence....

a partial overlap in

An “assessment-based certificate program” is a program granting AME based upon :

- (a) provides instruction and training to aid participants in acquiring specific knowledge, skills, and/or competencies associated with intended learning outcomes;
- (b) evaluates participants’ achievement of the intended learning outcomes; and
- (c) awards a certificate only to those participants who meet the performance, proficiency or passing standard for the assessment(s) (hence the term, “assessment-based certificate program”).

Certificates of attendance or participation are provided to individuals (participants) who have attended or participated in classes, courses, or other education/training programs or events.

The certificate awarded at the completion of the program or event signifies that the participant was present and in some cases that the participant actively participated in the program or event. Demonstration of accomplishment of the intended learning outcomes by participants is NOT a requirement for receiving the certificate; thus, possession of a certificate of attendance or participation does not indicate that the intended learning outcomes have been accomplished by the participant.

These are key distinctions between a certificate of attendance or participation and an assessment-based certificate program.

## Notes on "Civil Aviation"

Apprenticeship is a workplace-based program that teaches people the skills they need in the trades to achieve competencies and perform tasks to industry standards. Typically, an employer sponsors the apprentice.

On-the-job, the apprentice works under the direction of a journey-person. The training combines alternating periods of on-the-job (80 to 85%) and technical training (15 to 20%).

Most apprenticeship programs are four years in length.

An apprentice is hired by an employer, works with a journey-person in order to learn a trade. A certified journey-person is recognised as a qualified and skilled person in a trade, and, therefore, entitled to the wages and benefits associated with that trade.

A certified journey-person is allowed to train and act as a mentor to a registered apprentice.

Journey-persons can sign off on whether apprentices are achieving their key competencies on-the-job and play an important role in developing apprentice skill sets.

According to the 2007 National Apprenticeship Survey, the average time to complete an apprenticeship program is five years.

An individual wishing to become a certified journey-person must pass examination(s). If s/he passes, **a Certificate of Qualification is earned.**

### Skilled Labour Shortage 1

The older average age of many tradespeople and their stated intention to retire suggest that if efforts are not made to train the next generation of skilled workers, Canada's future economic competitiveness will be in serious jeopardy.

### Skilled Labour Shortage 2

Due to baby boomer retirements and an ageing population, Canada is facing a serious skilled labour shortage. The older average age of many tradespeople and their stated intention to retire suggest that if efforts are not made to train the next generation of skilled workers, Canada's future economic competitiveness will be in serious jeopardy.

For the sectors that rely upon tradespeople, apprenticeship is a proven training method that produces productive, highly skilled, and safe employees.

Since it typically takes five years to train an apprentice, industry needs to invest now in order to have the highly skilled tradespeople it needs for the future. A sustained and ongoing commitment to training and to passing down knowledge will be required if skill shortages are to be effectively addressed.

CAF-FCA is interested in gathering further skills shortage and labour market data relevant to the trades. If you know of any reports, please e-mail: [info@caf-fca.org](mailto:info@caf-fca.org)

current approach to the regulation of GA does not demonstrably pass the proportionality test, a key principle of Better Regulation which requires a balance between corrective measures and the severity of the nature of the act being regulated

regulation that manages third party risk

It is impossible to completely mitigate all safety risks CAP 1188 May 2014 Page 9

The highest priorities for the CAA are ensuring the safety of non-participant third parties on the ground and fare-paying passengers flying commercially.

The CAA's statutory duties require us to protect those who are not involved with aviation activities, for example third parties on the ground, as well as those who travel with the primary expectation of arriving safely at their destination, for example commercial passengers. source ref: UK-CAA CAP 1188 GA policy Consultation, May 2014

Decisions about intervention would be applied on the basis of best available evidence, drawn both from other relevant countries and sectors, and the principle of safety standards acknowledgement and consent, sometimes referred to as informed consent.

General aviation is a crucial part of the UK's aviation sector. It trains some of the next generation of pilots and engineers, supports highly-skilled jobs, provides essential services and forms a key part of our cultural heritage.

The UK enjoys an enviable reputation as a place of excellence in aviation. However, the UK GA sector finds itself under increasing strain as costs of operation rise due to fiscal pressures, the application of a European regulatory framework and perceived over regulation by the CAA. Too much prescription in the rules and a lack of proportionality have both impacted adversely on the sector.

regulation intended for the commercial air transport sector should not be read directly across to the GA sector.

# The “King’s Regulations & Orders” - KR&O

KR&O for the RAF and ACI, UK / KR&O-RCAF and ABI, Canada

(Deals with : Constitutional law - Distribution of legislative authority)

## KR&O - CHAPTER 12 SECTION II - REGULATIONS TO ENSURE THE SAFETY OF AIRCRAFT

### 702 - MAINTENANCE, INSPECTION AND TESTING OF AIRCRAFT A.K.A “AIRCRAFT MAINTENANCE ORDERS”

#### 702.1 OBJECT, PURPOSE

- (a) to ensure Airframes, engines are maintained safe and serviceable
- (b) To Define responsibility for inspections and maintenance work
- (c) to ensure proper levels of records are kept of the inspections and maintenance work

#### 702.2 ISSUE

Part I - Describes organisation and defines individual responsibility  
Part II - Describes the “technical detail of Maintenance and Inspections”

#### 702.3 RESPONSIBILITY

- (a) C.O - The Commanding Officer of the Unit is to issue and sign the orders, he is also to amend them from time to time as may be necessary. He is not permitted to delegate his responsibility for the circulation of relevant orders from higher authority. He is to supervise the application of the orders and to co-ordinate the work in the flights, workshops, etc., of the unit.
- (b) **“Officer in Charge-Workshops” is responsible for the inspection and maintenance of aircraft and engines in the workshops. He is also to carry out such Major Inspections and special work as may be directed from time to time.**
- (c) Excepting such work as falls under clause 4 (Records and Forms), a **Flight Commander is entirely responsible for the maintenance of the aircraft in his flight.** Under {702.3} sub-clause (d) he may, however, delegate responsibilities to pilots who are in his opinion competent. He is also responsible within his flight for the adequate circulation of all orders affecting maintenance. He is also to **keep such records of circulation as will ensure that all copies of orders are amended as necessary.**
- (d) Every aircraft which is being flown is to be placed in the charge of a Pilot who is to be responsible for its maintenance. No pilot, other than the Flight Commander, is to have charge of more than two aircraft at any one time.
- (e) **The primary duty of flight NCOs of the rank of sergeant and above is supervision and inspection. Only in exceptional circumstances are they to be detailed to particular aircraft; should this course be necessary the Flight Commander is to take steps to ensure that supervision and inspection are not adversely affected. NCOs are to supervise periodic inspections and are to carry out independent checks organised in such a manner as to ensure each airframe and engine is completely inspected not less than once every six weeks. they are to supervise with particular care, all work done by inexperienced airmen. (1919 UK-ANR created the Engineering Officer rank - the KR&O may be contrary to the ANR)**
- (f) (f) Riggers & Fitters not above the rank of corporal are to be detailed for the maintenance of each aircraft, appropriate numbers are allowed on flight establishments. This employment of each rigger and fitter according to the scale allowed should be continuous on particular airframes and engines and their employment on other aircraft should be avoided as far as possible. The **sub-division of their responsibilities** is to be as follows:
  - (i) The senior fitter on an aircraft is to be **responsible for the care of the engine or engines, engine ignition, starting devices, fuel system, oil system, cooling system and all wiring, piping, controls, instruments and accessories in connection therewith. His responsibility includes the bolts or other devices attaching the parts to the airframe.** The fitter is responsible for the attachment only of wooden airscrews, if a metal airscrew is fitted he is responsible for the whole airscrew and any gearing and controls operating it.
  - (ii) The senior rigger on an aircraft is to be **responsible for the care of all parts other than those for which the fitter is responsible and those for which tradesmen** e.g: armourers, electricians etc., **are allowed** on the strength of the unit.

## Notes on "Civil Aviation"

- (iii) **The flight rigger and fitter NCOs, as appropriate, are to inspect all work done by any other person and to ensure that it does not prejudice the safety of the aircraft in any way. The person doing any such work is to be responsible for reporting to the appropriate NCO on its completion.**

### 702.5 MAINTENANCE SCHEDULES

Airframes and engine type maintenance schedules which describe the maintenance and indicate the frequency with which parts require inspection are published for each type of airframe and engine. *These schedules are for the guidance of officers responsible for drafting part II orders under clause 2.* The schedules may be embodied as part of the orders, but it is to be recognised they will have to be amplified or modified in the unit in order to embody the results of experience or to meet the special local conditions.

### 702.6 INSPECTIONS

- (a) The following types of routine inspection are to be recognised:

- (i) Between flights
- (ii) Daily
- (iii) Periodical
- (iv) For reconditioning or overhaul

**When an aircraft is due for inspection it is to be put "Unserviceable" until the inspection has been carried out.** This is to be done by the person responsible for carrying out the inspection

- (b) Every Aircraft is to be inspected daily by the senior rigger and fitter in charge of it. One hour should normally suffice for this work. After daily inspection the aeroplane may be regarded as serviceable for 24 hours unless a defect is reported or found at a between flight inspection or it becomes due for a periodic inspection or is subjected to abnormal treatment such as a heavy landing or is to be used for night flying (see clause 7 sub-clause (b))
- (c) Every aircraft is to be given periodical inspections at the intervals specified in the airframe or engine type maintenance schedules. **The flight commander may extend these periods by not more than 10 per cent. The authority for this extension is to be entered on the weekly aircraft maintenance form and signed by the flight commander at the time that it is given.**
- (d) The Flight Commander is to give orders for all periodical inspections in the flight daily duty sheet and is also to detail an NCO either to supervise or to carry out the inspection.
- (e) After completing the number of hours flying shown in column A of the table in sub clause (f), airframes may be allotted to the appropriate depot (or contractor) for reconditioning. The continuous use of the airframes up to the maximum flying hours shown in Column B may, however, be authorised by the AOC (or the CO of a carrier) on the recommendation of a board of officers. **This board is to consist of three officers of the general duties branch, one of whom is to be an experienced engineering specialist.** The board must inspect the airframe and the log books. The board may recommend a 1st extension of 100 hrs for landplanes (except where borne on H.M ships) For other types, and subsequent extensions of landplanes, this board may not recommend more than 50 hours. Where aircraft are carried in exposed positions on H.M. ships the number of flying hours before the airframes are examined by a reconditioning board is in no circumstances to exceed that laid down for ship-planes operating from carriers. **The C.O of the aircraft depot (or the A.I.D inspector at the contractor's works) is, on completion of the reconditioning, to furnish a certificate to the effect that all necessary repairs, modifications and renewals have been effected and he is to cause all necessary entries to be made in the log book.**

### 702.7 TESTING

- (a) **In the following circumstances an aircraft is to be tested in the air** by the pilot responsible for it, or by his flight commander, before it is flown by any other pilot:
- (i) After an inspection (under clause 6 (a)) other than a daily inspection.
  - (ii) After any work has been done which is likely to affect the flying characteristics of the aircraft.
  - (iii) After any work has been done on the aircraft arising from a report suggesting a mechanical defect.
  - (iv) After an engine or any of its major components have been changed or adjusted.
  - (v) At units where *ab initio* flying training is being done aircraft are to be tested daily by a fully qualified pilot before being flown by pupils.

**The rigger or fitter who has carried out the replacement or adjustment is, when possible, to be taken as a passenger during such flights.**

## Notes on "Civil Aviation"

- (b) After an engine has been completely overhauled or has had crankshaft or connecting rod bearings, gear wheels or other important working parts (where the nature of the work carried out has been such that interchangeability is not to be depended upon) replaced or refitted, the engine is to be tested and the parts opened up for inspection. The duration of the test should normally be one hour at about nine-tenths of its power, finishing with a period of about 2 minutes at full power. After inspection and re-assembly a test for about ten minutes under similar conditions is to be carried out.

### 706 OVERLOADING OF AIRCRAFT

The C.O of a flying unit will ensure that the gross weight shown in the Weight Sheet Summary for the type of aircraft, is not exceeded without the sanction of the the air or other officer commanding.

### 707 MODIFICATIONS

1. Under no circumstances may any modification which has not received the official sanction of the Air Ministry be made in any airframe or aircraft engine. All modifications which units (other than repair depots) are authorised to carry out are published in Air Ministry Confidential Orders, Technical Orders and Technical Instructions or Air Ministry Weekly Orders. In special cases modifications are authorised by letters or signals from the Air Ministry; these modifications are included in the next issue of Technical Orders. In addition to the above, repair depots are authorised to carry out the modifications named in the reconditioning specification for the type. Applications to make to any airframe or aircraft engine alterations or modifications which have not been sanctioned as above will be made, through the usual channels, to the Air Ministry.
2. The C.O of a Unit will be responsible that:
  1. all officers and such airmen as are immediately concerned are cognisant of the contents of the Air Ministry Air Ministry Confidential Orders, Technical Orders and Technical Instructions & e., in so far as they are individually concerned; and
  2. all modifications sanctioned as in clause 1 are embodied in the airframe or aircraft engines to which they relate, in accordance with the orders issued with them.
3. Where the use of a type of airframe or aircraft engine has been restricted by the Air Ministry pending the incorporation of a modification, a form 443 will be prepared for each aircraft or engine of that type in which the modification has not been completed. The lower half of the form will be attached to the airframe or aircraft engine concerned (where convenient, to the part affected) and will not be removed until the modification has been completed. Where the restrictions do not wholly stop flying, the note at the foot of the form 443 will be amended accordingly.
4. Every approved modification affecting an airframe or aircraft engine will be entered in the log book of that aircraft or engine in accordance with the instructions contained in the log book.

### 708 DEFECTIVE PARTS AND EXPERIMENTAL EQUIPMENT

1. Technical reports on experimental equipment under trial by units other than those coming directly under the Director of Technical Development will be forwarded in triplicate, through the usual channels, to the Air Ministry.

### 709 AIRWORTHINESS

1. When, for any reason, an air or other officer commanding has cause to question the airworthiness, generally or for any particular purpose, of any type of aeroplane, he will report the matter to the Air Ministry. He will use his discretion as to whether or not he shall order the suspension of flying on the particular type in question within his command.
2. Instructions to the service generally regarding the cessation for any reason, of flying on particular types of aeroplanes will be issued by the Air Ministry. The Director of Organisation and Staff Duties will be responsible that all such instructions are made known to the Director of Technical Development, who may at his discretion authorise such aeroplanes to be flown under his instructions at establishments under his control.

## Notes on "Civil Aviation"

### "PASSED BY PARLIAMENT"

"Passed by Parliament" is equivalent to having been given Royal Assent. The material has been obtained from the Debates of the Senate and the House of Commons, from the Journals of both Houses, from the explanatory notes to the Bills, and from the Statutes. The information is presented by session in the following format: the title of the Act and chapter number, the date of Royal Assent, the sponsor, the bill number, and its purpose.

### CANADIAN MILITARY POLICY

Canadian Military policy, well into World War II *was to adopt British military law. ( the 1919 ANR was a Military order to the Air Forces of the Empire. Canada was required to comply...or was it?*

*The history of British military law is, in effect, that of the early history of the Canadian military justice system - and the application of Canadian Military policy.*

*Military law applicable to British land and air forces developed in a different manner than the law applied to British naval forces, ergo:*

*Military law applicable to Canadian land and air forces developed in a different manner than the law applied to Canadian naval forces.*

**Question: Did the ANR 1919 bridge Service law for the Empire's Air Forces into Civilian Air law for the Empire..?**

(source ref: Canadian Government website: [Defence](#) > [Home](#) > [About](#) > [Reports and Publications](#) > [Military Law](#) > [Military Justice](#) > [Summary Trial Level 2.2](#) Chapter 2: History of Summary Proceedings)

(the following is from: CANADIAN AIR FORCE LEADERSHIP AND COMMAND - THE HUMAN DIMENSION OF EXPEDITIONARY AIR FORCE OPERATIONS)

1 January 1923 : Canadian Parliament makes Canadian Minister of National Defence responsible for:

1. Department of the Defence
  - (a) assumes responsibility for all government "Service" flying operations
  - (b) assumes responsibility for the control of "Civilian" aviation.
2. Department of the Naval Service
3. Department of the Air Board
4. Department of the Militia

1927 a technical training "scheme" (Programme) was started to supply skilled tradesmen for the Air Force.

1927 : RCAF reorganised, Directorate of Civil Government Air Operations (DCGAO) created to:

1. Administer all non-military air operations carried out by government aircraft.
2. Control all non-military air operations carried out by government aircraft.
3. Administer units, detachments and formations of the RCAF placed under its control.
4. Control units, detachments and formations of the RCAF placed under its control.

The DCGAO organizational structure:

1. "nominally" a civil organization (means "other than civilians" actually ran the organization)
2. reported to the Deputy Minister of National Defence.
3. staffed primarily by RCAF personnel
4. reorganization produced considerable shuffling of offices and appointments
5. effect on flying operations was more apparent than real.

### THE UK & CANADIAN AIR FORCE - LEGAL BASIS

The history of military law relating to the air force is brief, in keeping with the recent origins of such military forces.

During World War I, Canadian air force personnel flew with British units.

Discipline of British air units governed by the United Kingdom Air Force (Constitution) Act 1917.

## Notes on “Civil Aviation”

The Air Force (Constitution) Act, 1917, (U.K.) 7 & 8 Geo. V, c. 51 forms the Second Schedule to the Air Force (Constitution) Act, 1917.) which included the Air Force Act.

The UK Air Force Act 1917 literally replaces word for word the “Army” provisions to comply with “Air Force” terminology.

Since 1917 the military law applicable to British Air Forces has remained virtually identical to the law governing the British Army. (McDonald, “The Trail of Discipline: The Historical Roots of Canadian Military Law” at 19.)

1 April 1924 : Royal Canadian Air Force created pursuant to an Order in Council passed under the authority of the Air Board Act

1 April 1924 : Order in Council provides that *discipline would be maintained in accordance with the British Air Force Act*, except where it was inconsistent with the applicable Order in Council.

1940 : separate Royal Canadian Air Force Act enacted.

Royal Canadian Air Force Act 1940 retains the disciplinary provisions of the British Air Force Act

SMITH, J.—The following are the questions submitted:—

1. Query : Have the Parliament and Government of Canada exclusive legislative and executive authority for performing the obligations of Canada, or of any province thereof, under the Convention entitled “Convention relating to the Regulation of Aerial Navigation?”

Respondent : In my opinion, the answer to question 1 is determined by the decision in *Attorney General of British Columbia v. Attorney General of Canada*.<sup>[21]</sup> In that case, a treaty was made in 1913 between His Majesty the King and the Emperor of Japan, by which it was, among other things, agreed that the subjects of each of the High Contracting Parties should have full liberty to enter, travel and reside in the territories of the other, and in all that relates to the pursuit of their industries, callings, professions and educational studies, should be placed in all respects on the same footing as the subjects or citizens of the most favoured nation”

Respondent : Section 132 of the British North America Act is as follows:—

**132. The Parliament and Government of Canada shall have all powers necessary or proper for performing the obligations of Canada, or of any province thereof, as part of the British Empire, towards Foreign Countries arising under treaties between the Empire and such foreign countries.**

**Respondent : It follows, in my opinion, that the Dominion Parliament has paramount jurisdiction to legislate for the performance of all treaty obligations, and that, while a province may effectively legislate for that purpose in regard to any matter falling within s. 92 of the *British North America Act* while the field is unoccupied by the Dominion (but not otherwise), Dominion legislation, being paramount, will, when enacted, supersede that of the provinces about such matters.**

Respondent : The answer to the first question, therefore, substituting the word “paramount” for the word “exclusive,” is in the affirmative. I am of the opinion that, taking the words in question 2, “regulation and control of aeronautics generally within Canada,” as meaning unlimited regulations and control of aeronautics within Canada, the answer must be in the negative.

**The contention on behalf of the provinces is that the international Convention applies only to aircraft operated internationally, and has no application to aircraft of any of the contracting countries which flies wholly within the territory of the country where it is owned. ANC1919 applied nationally to the empire, ANC 1920 incorporated ICAN for allowing international operation**

Respondent : In some respects the Convention purports to deal only with international flying, but in others with the flying of all aircraft.

For example, article 25 is as follows:

*“Each contracting State undertakes to adopt measures to ensure that every aircraft flying above the limits of its territory and that every aircraft, wherever it may be, carrying its nationality mark, shall comply with the regulations contained in Annex D.”*

Annex D lays down elaborate rules as to lights and signals, and rules for air traffic, following closely the rules of water navigation.

**However the wording “Above the limits” may have been mis-interpreted by the Respondent : in this case it may have meant - based on the war terminology and root from UK English - Beyond the arm of the crown / state to control.**

## Notes on “Civil Aviation”

Respondent : If the contention of the provinces be sound, every province, so far as this Convention is concerned, would be entitled to establish rules of its own, as to lights and signals and air traffic, which might be entirely at variance with the international rules laid down in the Convention, and each of which might be at variance with the other.

**The manifest object of these rules as set out in the Convention is to secure safety in air navigation for all craft flying over the territory of the parties to the treaty;** and it is unreasonable to suppose that these rules were to apply only to aircraft flying internationally, and that every country and every province was at liberty to make its own rules for aircraft owned and flying within its own territory.

Respondent : I am of opinion, therefore, that under article 25 the Dominion is under obligation to adopt measures to ensure that every aircraft flying above the limits of Canadian territory shall comply with the regulations contained in Annex D, and has authority to enact accordingly.

Article 12 is as follows:—

*Article - 12. **The commanding officer, pilots, engineers and other members of the operating crew of every aircraft shall, in accordance with the conditions laid down in Annex E, be provided with certificates of competency and licences issued or rendered valid by the State whose nationality the aircraft possesses.***

Annex E has the following:—

*The conditions set forth in the present Annex are the minimum conditions required for the issue of certificates and licences valid for international traffic. Nevertheless, each contracting State will be entitled to issue certificates and licences, not valid for international traffic, subject to such less stringent conditions as it may deem adequate to ensure the safety of air traffic. The said certificates and licences will not, however, be valid for flight over the territory of another State.*

Article 12 in terms refers to the operating crew of *every aircraft*, while the preceding article 11, expressly refers to *every aircraft engaged in international navigation*.

*In the portion of Annex E just quoted, we (Canada) have express provision for the issue of certificates and licences by each of the states for flying within its own territory, on such less stringent conditions as each state may deem adequate to ensure the safety of air traffic. By virtue, therefore, of article 12 and Annex E, there is imposed upon each party to the Convention an express obligation to control in this way all aircraft flying exclusively within its own territory.*

**The Dominion Parliament has not, independently of treaty, jurisdiction to legislate on the subject of air navigation generally, the word “generally” being construed as equivalent to “in every respect”; and it did not, by the International “Convention relating to the Regulation of Aerial Navigation,” acquire, under section 132 of the B.N.A. Act, exclusive authority to legislate in such a way as to carry out the obligations the Convention imposes on Canada and its provinces. But the Dominion Parliament’s jurisdiction is paramount in the exercise of its authority to carry out these obligations.** Supreme Court of Canada... **where did the Respondent obtain their definition of “generally”? what was the interpretive document used to write ICAN ?**

Respondent : The Dominion may exercise legislative jurisdiction in relation to aviation in the course of executing its authority over various matters which fall within certain of the enumerated heads of s. 91 or within the subject of Immigration (s. 95); it may also exercise such authority under s. 132 where the conditions exist under which that section comes into play. **These conditions are, first, that there exists an obligation of Canada or of a province (as part of the British Empire) towards a foreign country arising under a treaty between the Empire and a foreign country, and, second, that the obligation relates to the subject of aviation or in some manner affects it.** The powers arising under that section are given for performing such obligations, and can only be validly exercised in the performance of, and for the purpose of performing, them. Legislation enacted in the valid exercise of such powers takes effect notwithstanding any conflicting law of a province; the **Dominion has full competence under s. 132 to give effect by legislation to the rules embodied in the Convention of 1919, and to take measures for the effectual enforcement of them.—Any conflicting or repugnant provincial rules would be superseded by such legislation**

Reference re legislative powers as to regulation and control of aeronautics in Canada, [1930] S.C.R. 663 Date: 1930-10-07

Respondent : “The Minister apprehends that this legislation was enacted by Parliament by reason not only of the expediency of making provision for the regulation of a service essentially important in itself as touching closely the national life and interests, but also of the necessity of making provision for performing the obligations of Canada, as part of the British Empire under the Convention relating to the regulation of Aerial Navigation which, drawn up by a Commission constituted by the Peace Conference at Paris in 1919, was, on 13th October of that year, signed by the representatives of 26 of the Allied and Associated Powers including Canada.

## Notes on "Civil Aviation"

Respondent : "This **Convention was ratified by His Majesty on behalf of the British Empire on 1st June, 1922**, and is now in force, as the Minister is informed, as between the British Empire and 17 other States.

"The Minister observes that the Air Regulations, 1920, conform in essential particulars to the provisions of the said Convention, and are designed to give effect to the stipulations thereof in discharge of **the obligations of Canada, as part of the British Empire**, towards the other contracting States.

Respondent : The subject of paragraph (a) is the licensing of personnel, which is dealt with by article 12 of the Convention. Under article 12, when read with Annex E, the obligation of each of the contracting states is **to enforce in respect to certificates and licences**, the conditions set forth in Annex E as regards international traffic, and, **as regards domestic traffic, to enforce such conditions**, not more stringent than those stated in Annex E, **as the contracting state may deem adequate to ensure the safety of air traffic**. No argument seems to be needed to show that for performing that obligation the Dominion does not require an unrestricted authority to regulate and control the licensing of personnel in all respects; which would include power to select licensees upon some principle having no relation to the safety of air traffic, or indeed, to any of the conditions laid down in Annex E.

Respondent : It is convenient to refer to regulation 33, which seems broadly to require a certificate from the Air Board to entitle anybody to act as pilot, engineer or inspector of any commercial aircraft, or of any Canadian aircraft flying outside Canada. It would be inadmissible to suppose that regulations 33 to 38 contemplate the issue, upon demand, of a certificate to any applicant; and indeed the enactment of regulations to that effect would constitute a grave departure from the requirements of Annex E. The regulations appear to leave the conditions upon which licences may be granted to the unlimited discretion of the Air Board, which conditions might be framed without any reference to article 12 or Annex E. Clearly regulations 33 to 38 on any construction of them, could not be validly sanctioned under the powers given under section 132 to legislate for the performance of the obligations mentioned.

Respondent : As I read the opinions of my three learned brothers, they all agree that "the Convention relating to the regulations of Aerial Navigation," dated the 13th of October, 1919, is "a treaty between the Empire and foreign countries," within the meaning of s. 132 of the B.N.A. Act. They are also in accord in regarding intra-provincial aviation as, prima facie, a matter of provincial legislative jurisdiction and as falling within the purview of s. 92 (13) of the B.N.A. Act; and I share those views. Sub-paragraph (b) of section 4 deals with registration, identification, inspection, certification and licensing of aircraft. Let us first consider registration. There is an implied duty to provide for registration in accordance with the provisions of section 1 (c) of Annex A of the Convention. The main purpose of registration under the provisions of the Convention is to provide facilities for identification. There is no duty, arising out of these provisions, to impose conditions other than those indicated in the Annex. There is nothing in that part of the Convention requiring legislation in the terms of section 4, or in the terms of regulations 3 and 4, the effect of which is, that aircraft may be registered only on compliance with the conditions defined by the Air Board, and that registration is a condition of the right to fly. These regulations as they stand could not be validly sanctioned under section 132. As to certification and licensing of aircraft, the Convention imposes no duty as to such certificates, except in relation to international navigation. No duty arises out of the Convention which would enable the Dominion to sanction the sweeping enactment of section 4 in relation to the certification and licensing. Regulation 12 (2) seems to require a certificate of air worthiness in respect of commercial aircraft and provincial aircraft registered in Canada. By regulation 13, such certificates may be issued upon compliance with specified conditions. In the result, such aircraft may not be registered, and consequently will not be permitted to fly, unless certified as air worthy upon conditions prescribed by the Air Board. These regulations are rather obscurely worded, but this seems to be the practical effect of them. There is no obligation, under the Convention, that is to say, no express obligation, to require such certification as a condition of domestic flying, and it is difficult to discover on what ground the condition imposed by these regulations, which affects all commercial aircraft flying in Canada, and all provincial aircraft, can be justified. The regulation as it stands would not be a valid one. Respondent : Justice DUFF J.

The Minister of Justice, in his report to Council, apprehends that this legislation was enacted by Parliament by reason not only of the expediency of making provision for the regulation of a service essentially important in itself as touching closely the national life and interests, but also of the necessity of making provision for performing the obligations of Canada, as part of the British Empire under the Convention relating to the regulation of Aerial Navigation which, drawn up by a Commission constituted by the Peace Conference at Paris in 1919, was, on 13th October of that year, signed by the representatives of 26 of the Allied and Associated Powers including Canada.

This convention was ratified by His Majesty on behalf of the British Empire on 1st June, 1922, and is now in force, as the Minister is informed, as between the British Empire and 17 other States.

## Notes on "Civil Aviation"

The Minister observes that the Air Regulations 1920, conform in essential particulars to the provisions of the said Convention, and are designed to give effect to the stipulations thereof in discharge of the obligations of Canada, as part of the British Empire, towards the other contracting States.

As already stated, the treaty was signed on behalf of the Empire on the 13th October, 1919, and ratifications deposited in Paris on June 1st, 1922.

The *Air Board Act* was assented to on the 6th of June, 1919, before the Parliament of Canada could invoke article 132 to secure the power of performing the obligations of Canada under a treaty which was not then in existence. It requires an existing treaty to give validity to legislation, not merely a prospective convention. **The Parliament and Government of Canada may have paramount, though not exclusive, legislative and executive authority for performing the obligations of Canada**, or any province thereof, under the Convention, but have not yet found it necessary or proper to exercise such legislative power.

### "As framed, question no.1 must be answered in the negative..."

whether- or not the federal government's Air Board Act was *intra vires*.

The way a question was "framed" influenced the judicial answer that question, that's what the term *framing effects* means. an unsettling aspect of *framing effects*, the fact that they can actually influence our **memories**. Each person will answer **questions** based on own perspective and information made available

This concept is used in advertising all the time, but the most fertile ground for framing effects is politics. Framing effects are powerful, they have a profound influence on people, but when we recognize that these biases exist, we can gain some measure of control. We all have to understand how fragile our brains and memories are, and that will strengthen them. If we know these biases exist, it's easier to try to avoid them. So the next time you hear a politician speaking or an advertisement telling you to buy some product, listen closely to it, and try to decipher it's real content.

#### ULTRA VIRES-INTRA VIRES

*Ultra vires* [Latin, "*beyond the powers*"] is used in **Constitutional Law** by the courts who must decide the respective competences of Parliament and provincial legislatures. If one or the other, in enacting a law, goes beyond the jurisdiction allotted to it by the constitution, the court will declare that measure *ultra vires*. If not, the court will declare it *Intra vires* [Latin, "*within the powers*"]. delegated bodies may, within their established limits, adopt regulations which, to be valid, must not exceed the limits prescribed by law. - Canadian Encyclopaedia

#### INVALID EXCESS OF AUTHORITY OR POWER EXERCISED BY AN ENTITY.

Since the powers exercised by any officer of an organization are limited by the constituting or vesting instrument (such as a memorandum of association), any act outside those limitations is *ultra vires* and may be challenged in the courts. This rule is applicable to all powers, express or implied, created by a contract or statute.

Read more: <http://www.businessdictionary.com/definition/ultra-vires.html#ixzz43cws12m4>

<https://scc-csc.lexum.com/scc-csc/scc-csc/en/item/8947/index.do>

According to a certificate from the Under-Secretary of State for Foreign Affairs, the Paris Convention of 1919 was denounced by Canada, which denunciation became effective in 1947. This was done because on February 13, 1947, Canada had deposited its Instrument of Ratification of the Convention on International Civil Aviation signed at Chicago December 8, 1944 and which Convention came into force on April 4, 1941.

With the exception of certain amendments the Aeronautics Act remains on the statute books of Canada in the same terms as those considered by the Judicial Committee in the Aeronautics case of 1932.

Section 132 of the B.N.A. Act therefore ceased to have any efficacy (the ability to produce a desired or intended result) to permit Parliament to legislate upon the subject of aeronautics - Justice Kerwin,

## Notes on "Civil Aviation"

The fact that the Paris Convention Relating to the Regulation of Aerial Navigation of 1919 was, ratified on Canada's behalf by Great Britain made it possible for the courts to award exclusive power to the federal government pursuant to section 132 of the British North America Act.

Twenty years after "the Judicial" decision of 1932, Canada had incurred obligations similar to those "found in the Paris Convention by the ratification of the 'successor instrument' - the Chicago Convention on International Civil Aviation of 1944.

That is, a substantial re-drafting of domestic legislation would have resulted had the Supreme Court held that provinces are entitled to some degree of concurrent jurisdiction of aeronautics.

Canada would also have had to submit a protocol to the Convention signifying the existence of provincial implementing legislation while remaining responsible in international law for the enforcement of the country.

Lord Sankey outlines the obligations which Canada, as part of the British Empire: "*With a view to performing her obligations as part of the British Empire* under this convention, which was then in course of preparation, *the Parliament of Canada* enacted the Air Board Act, c.II of the Statutes of Canada, 1919 (1st session), which with an amendment thereto, was consolidated in the Revised Statutes of Canada, 1927, as c. 43, under the title the Aeronautics Act. *the fulfilment of Canadian obligations under s. 132 are matters of national interest and importance; and that aerial navigation is a class of subject which has attained such dimensions as to affect the body politic of the Dominion.*

The court states that *air navigation is a matter of national importance and concern and falls within the peace, order and good government language of section 91 of the B.N.A. Act.*

Background : Linneage :

GEORGE THE FIFTH, by the Grace of God of the United Kingdom of Great Britain and Ireland, and of the British Dominions beyond the seas KING, Defender of the Faith, Emperor of India .

IN TESTIMONY WHEREOF, *We have caused these Our Letters to be made Patent, and the Great Seal of Canada to be hereunto affixed.*

WITNESS, Our Most Dear and Entirely beloved Uncle and Most Faithful Counsellor : Field Marshal His Royal Highness PRINCE ARTHUR WILLIAM PATRICK ALBERT,

Duke of Comtaught and of Strathearn,

Earl of Sussex (in the Peerage of the United Kingdom),

Prince of the United Kingdom of Great Britain and Ireland,

Duke of Saxony,

Prince of Saxe-Coburg and Gotha ;

Knight of Our Most Noble Order of the Garter ;

Knight of Our Most Ancient and Most Noble Order of the Thistle ;

Knight of Our Most Illustrious Order of Saint Patrick ;

one of Our most Honourable Privy Council ;

Great Master of Our Most Honourable Order of the Bath ;

Knight Grand Commander of Our Most Exalted Order of the Star of India ;

Knight Grand Cross of Our Most Distinguished Order of Saint Michael and Saint George ;

Knight Grand Commander of Our Most Eminent Order of the Indian Empire ;

Knight Grand Cross of Our Royal Victorian Order ;

Our Personal Aide-de-Camp ;

Governor General and Commander-in-Chief of Our Dominion of Canada.

At Our Government House, in Our City of OTTAWA, this XXXXX day of XXXXXXX in the year of Our Lord one thousand nine hundred and XXXXXX, and in the XXth year of Our Reign .

By command,  
THOMAS MULVEY,  
Under-Secretary of State.

06 March 1915 : Ottawa : BY THE KING.

A PROCLAMATION Relating to Trading with the Enemy  
(Occupied Territory).

GEORGE R.I.

wHEREAS, as a result of the present w•tr, certain  
territory forming part of the territory of an enemy  
countr , is, or may be in the effective military occupation  
ofyUs or Our Allies, or of a Neutral State (in this

Proclamation referred to as 'tterritory in friendly occupation"), and certain territory forming part of Our territory or of that of an  
allied or neutrel State, or may be in the effective military occupation of an enemy in this Proclamation referred to as "territory in  
hostile occupation" ); AND WeERaAa it is expedipnt in Our interest and in that of Our Allies that the Proclamatione relating to  
trading with the enemy should apply to territory in friendly occupation as they aPp Iv to Our territory or that of Our Allies, and  
s(l ould apply to territory in hostile occupation as they apply to an enemy country: -

Now, THRREPORR, we have thought fit, by the advice of Our Privy Council, to issue Royal Proclamation declaring, and it is  
hereby as follows:

3 . The certificate of any person authorised by a Secretary of State to give such certificates, that any such

By THE KING.

**In the United Kingdom, a Secretary of State is a Cabinet Minister in charge of a Government Department**

**KR&O - Regulations that lay down the policy and procedure to be observed in the command and administration : general matters concerned with a commanding officer's responsibilities : Unit Command, Control and Administration**

the framework of command and administration above the unit level

The government and command of each of the fighting Services is vested in Her Majesty The Queen, who has:

charged the Secretary of State with general responsibility for the defence of the Realm and

established a Defence Council having command and administration over Her armed forces.

statutory functions of the Secretaries of State for War and Air

The Air Force Boards are empowered by Royal Warrant to exercise certain prerogative functions.

Letters Patent

"units" are defined as "those elements having a separate Establishment". The term 'unit' may apply to"

a battalion or any equivalent lieutenant colonel's command;

to an independent smaller body, commanded by an officer of the rank of major or below (normally referred to as an 'independent sub unit');

to a depot or to a training establishment.

Any headquarters above the unit level is, for the purposes of administration, regarded as being itself a unit.

Individual units and headquarters are organized according to specific establishments which lay down authorized (personnel) strengths by ranks and trades, and numbers of vehicles, weapons and animals.

to understand Command of Units (*see* Manual of military "service" Law )

Any document referring to the "Directions" or to any provision of them shall, so, far as may be necessary for preserving its effect, be construed as referring to these Directions or, as the case may be, to the corresponding provision of them.

**The Interpretation Act of the stated year shall apply for the purpose of interpreting these Directions as it applies for the purpose of interpreting an Act of Parliament.**

## **RANK AND PRECEDENCE**

### **General Principles**

**2.031.**

- a.* Officers holding substantive rank are to take precedence over all those holding acting or local rank of the same grade. They are to take precedence among themselves according to their date of promotion to that rank.
- b.* Officers of the TA or Regular Officers on Home Service Part Time terms of service holding brevet rank are, when employed outside their regiment or corps, to take precedence with officers holding substantive rank of the same grade, according to date of promotion. When serving regimentally they are to take precedence within their regiment or corps in accordance with the date of their promotion to substantive rank.
- c.* Officers holding acting rank are to take precedence over all those holding local rank of the same grade and are to take precedence among themselves according to the date of their appointment to acting rank.
- d.* Officers holding local rank are to take precedence among themselves according to the date of their appointment to that local rank.
- e.* Precedence among warrant officers and NCOs is to follow the principles in sub-paras *a*, *c* and *d* above but is to be governed also by the precedence of corps (**see para 8.001**) and in some cases by the appointment held. This aspect is dealt with in detail in

## THE ROLE OF OFFICERS.

**The Role of Officers.** : Leadership is the principal duty of all officers; those holding Commissions, Warrants and non-commissioned officers. Commissioned officers in the British Army have a special responsibility for leadership. The Queen's Commission means that it is always the duty of a commissioned officer to take moral responsibility for the task and those subordinate in rank, whether they are in his or her direct chain of command or not. This includes setting an example both on and off duty. In the heat of battle, and in an environment sometimes dominated by high emotion and the pernicious effects of boredom and complacency, officers should have a strong enough moral compass and sufficient backbone to avoid over-familiarity and favour. They are required to prevent breakdowns in standards, ethics and the law; or simply to grip a deteriorating situation, failures in battlefield discipline, dress or bearing. The pressures or achievements of operations should not be used as an excuse to ignore or tolerate poor discipline or low professional standards. That would be a failure of moral courage and professional obligation and a breach of trust.

*"You are, in such manner and on such occasions as may be prescribed by us, to exercise and well discipline in their duties such officers, men and women as may be placed under your orders from time to time and use your best endeavours to keep them in good order and discipline...in pursuance of the Trust hereby reposed in you."*<sup>5</sup>

## 5.121 CH.5 UNIT COMMAND, CONTROL AND ADMINISTRATION PART 3 - ORDERS AND DUTIES

### Orders

#### 5.121.

- a.* Orders and instructions received by commanding officers and which are for observance by officers and soldiers under their command are to be the subject of unit orders properly signed and posted at recognized places.
- b.* Officers and, in so far as practicable and applicable, warrant officers are to acquaint themselves with regulations and orders relevant to their unit's role and its administration. They are to be afforded facilities to enable them to keep abreast of changes and amendments to these matters, and ignorance of them will not be accepted as an excuse for their non-observance.

Current 2016 letters patent to the UK MOD

## LETTERS PATENT CONSTITUTING THE DEFENCE COUNCIL (PARA J1.003 REFERS)

Elizabeth The Second by the Grace of God of the United Kingdom of Great Britain and Northern Ireland and of Our other Realms and Territories Queen Head of the Commonwealth Defender of the Faith.

To all to whom these Presents shall come Greeting.

Whereas We did by Our Letters Patent under the Great Seal of Our Realm bearing date the fourth day of May in the forty-second year of Our Reign constitute and appoint the persons therein named to be Our Defence Council to exercise on Our behalf the functions of Our Prerogative as therein mentioned

## Notes on "Civil Aviation"

And Whereas We are desirous of changing the constitution of Our said Defence Council Now therefore Know Ye that We do revoke with effect from the fifth day of November in the forty-eighth year of Our Reign Our Letters Patent bearing date the fourth day of May in the forty-second year of Our Reign aforesaid And Further Know Ye that We do constitute and appoint as from the said fifth day of November the following persons in place of those constituted and appointed by Our Letters Patent aforesaid that is to say Our Principal Secretary of State for Defence the Minister of State for the Armed Forces the Minister of State for Defence Procurement the Parliamentary Under Secretary of State for Defence the Chief of the Defence Staff the Permanent Under Secretary of State of the Ministry of Defence the Chief of the Naval Staff and First Sea Lord the Chief of the General Staff the Chief of the Air Staff the Vice Chief of the Defence Staff the Chief of Defence Procurement for the Ministry of Defence the Chief Scientific Adviser of the Ministry of Defence the Chief of Defence Logistics and the Second Permanent Under Secretary of State of the Ministry of Defence to be Our Defence Council to exercise on Our behalf the functions of Our Prerogative which have heretofore on Our behalf been exercised by Our Defence Council constituted and appointed by Our Letters Patent aforesaid and in particular to administer such matters pertaining to Our Naval Military and Air Forces as We shall through Our Principal Secretary of State for Defence direct them to execute And to have command under Us of all Officers and Ratings Soldiers and Airmen of Our Naval Military and Air Forces And Further Know Ye that Our Principal Secretary of State for Defence (or in his absence one of Our Ministers of State aforesaid) shall be Chairman of Our Defence Council so constituted and for the business of which he shall be responsible to Us and to Parliament And the said Permanent Under Secretary of State of the Ministry of Defence shall be the Secretary of Our Defence Council Provided that Our Defence Council may appoint such other person or persons to act as Secretary or Secretaries in addition to the said Permanent Under Secretary of State as Our Defence Council may think fit And We do empower and direct Our Defence Council to establish an Admiralty Board an Army Board and an Air Force Board to be charged with the administration of such matters relating to Our Naval Military and Air Forces as Our Defence Council shall direct And to have command under Us and Our Defence Council of all Officers and Ratings Soldiers and Airmen whom Our Defence Council shall place under their command And we do grant Our Defence Council authority to give and dispose of all such Offices places and employments in Our Naval Military and Air Forces as shall become or be made vacant And We enjoin all such Officers and all others whom it may concern to be obedient to Our Defence Council and to the Boards established by Our Defence Council by virtue of these Presents in all things as becometh And Further Know Ye that the powers of Our Defence Council and of the Boards so appointed may be exercised and their duties performed by any two of their members and any document may be signed on behalf of Our Defence Council or of any of the said Boards by any two of their members or by the Secretary or person acting as Secretary of Our Defence Council or of that Board And We Do further direct that the arrangements for the administration and government of Our Naval Military and Air Forces described in these Our Letters shall come into effect on the said fifth day of November in the forty-eighth year of Our Reign In Witness whereof We have caused these Our Letters to be made Patent Witness Ourself at Westminster the fifth day of November in the forty-eighth year of Our Reign.

By Warrant under The Queen's Sign Manual

### CONTROL OF AERONAUTICS - THE AIR BOARD ACT

The Air Board Act (Chapter 11)

provides for the appointment by the Governor in Council of an Air Board consisting of from five to seven members to include a Minister of the Crown as chairman and representatives of the Departments of Militia and Naval Service. The Board is given powers of control over aerodromes, air stations, air craft, etc., and generally over aerial navigation in Canada and its territorial waters.

The Canadian Air Board consisted of:

the Rt. Hon. A. L. Sifton, P.C., K.C., Chairman ;

Mr. O. M. Biggar, K.C., Vice-Chairman ;

the Hon. S. C. Mewburn, C.M.G. ;

the Hon. C. C. Ballantyne;

## Notes on "Civil Aviation"

Dr. R. M. Coulter;

Mr. J. A. Wilson;

Mr. E. S. Busby ;

The heads of branches are:

Lieut.-Col. R. Leckie, D.S.O., D.S.C., D.F.C., Superintendent of Flying Operations ;

Lieut.-Col. J. S. Scott, M.C., A.F.C., Superintendent of Certificates Branch ;

Major A. M. Shook, D.S.O., D.F.C., A.F.C., Secretary.

General.—The Air Board Act was assented to on June 6, 1919, and by Order in Council dated June 23 (P.C. 1295),

the Hon. A. L. Sifton was named as Chairman of the Board,

Col. O. M. Biggar, Judge Advocate-General, as Vice-“ Chairman ;

the Hon. S. C. Mewburn, Minister of Militia and Defence, as the representative on the Board of the Department of Militia and Defence ;

the Hon. C. C. Ballantyne, Minister of the Naval Service, as the representative on the Board of the Department of the Naval Service,

and Dr. R. M. Coulter, C.M.G., Deputy Postmaster-General,

Mr. J. A. Wilson, Assistant Deputy Minister, Department of the Naval Service, and

Mr. E. S. Busby, Chief Inspector of the Department of Customs and Inland Revenue.

The Board was called together immediately, and considered the organisation of a staff. After consultation with the Civil Service Commission, it was decided that the work under the Board should be divided into three branches, having at their heads respectively a Superintendent of Flying Operations, a Superintendent, Certificate Branch, and a Secretary, the proposal being that the Secretary should administer the internal office organisation, that the Superintendent of Flying Operations should control all civil government flying, and that the Superintendent of the Certificate Branch should conduct that portion of the administration which related to the public and was concerned with the licensing of personnel, aircraft and air harbours. The organisation thus outlined was formally communicated to the Civil Service Commission on July 15, with a request that provision should at once be made for the appointment of these three officers and a medical officer for the Certificate Branch.

No appointments were, however, made until after some time, and the first appointees assumed their duties as follows

November 3, Lieut.- Col. J. Stanley Scott, M.C., A.F.C., Superintendent, Certificate Branch ;

November 10, Major A. M. Shook, D.F.O., D.F.C., A.F.C., Croix de Guerre, Secretary, and

November 10 Capt. F. R. Smith, Medical Officer ;

December 15, Lieut.- Col. Robert Leckie, D.S.O., D.S.C., D.F.C., Superintendent of Flying Operations.

Permanent office accommodation was made available for the Board's staff only on December 24.

## 2. Air Regulations

---

The only step which, before the appointment of technical officers, it was possible to take in the direction of regulating and controlling aerial navigation was to prohibit dangerous flying. An Order in Council for this purpose was passed on July 7 (P.C. 1379).

The drafting of a complete set of regulations was, however, proceeded with, and was completed in time for their submission to and approval by the Governor in Council on December 31. The Canada Gazette containing the regulations was published on January 17, 1920, and at the same time there was ready for distribution a book containing not only the regulations, but also the forms settled for use under them, the Air Board Act and the Convention relating to International Air Navigation as drafted by a sub-commission constituted as part of the organisation of the Peace Conference and approved by the Supreme Council. This book has already had a wide distribution.

## 2 Preliminary Surveys for Operations

---

In November steps were taken to have made a preliminary survey with a view to ascertaining what public services could more efficiently, and in the broadest sense more economically, be performed by air than by existing methods. Canada was, for this purpose, divided into four parts, and ex-Royal Air Force officers borrowed or temporarily employed for the purpose.

The survey was completed by the end of the year, and on January 2 these officers were assembled at Ottawa and the situation was thoroughly canvassed, with the result that it was decided that the most favourable fields for the commencement of operations were

## Notes on "Civil Aviation"

the less thickly settled and less thoroughly explored portions of Canada. An interdepartmental conference was accordingly held on January 10 1920.

An agenda for this conference, including memoranda on the probable cost of operating aircraft and on their use for purposes of survey and for fire protection, was distributed, and a number of places were named as possible air stations, upon the utility of each of which discussion was invited.

The usefulness of this preliminary conference was reduced by the non-participation of some of the departments which it was expected would be interested, but special discussions have since been carried on with those departments which were represented and some others. Proposals have been formulated for operations next summer.

### 4. Scientific Research

---

Among the duties imposed upon the Board is that of **undertaking technical research for the development of aeronautics** and of co-operating for that purpose with other institutions.

In execution of this duty, discussions took place with the Honorary Advisory Council for Scientific and Industrial Research, which resulted in the formation under that Council of an Associate Air Research Committee, which held its first meeting on February 7 1920.

07 February 1920 NRC - Associate Air Research Committee :

Chairman of the Committee : Prof. A. S. Eve, Professor of Physics : McGill University

Secretary : Mr. R. J. Durley, Secretary of the Engineering Standards Association

Member : Prof. J.C. McLennan, Professor of Physics : University of Toronto,

Member : Mr. J. R. Parkin, lecturer, faculty of applied science : University of Toronto

This Committee will work in the closest co-operation with the officers of the Air Board, and will co-ordinate aeronautic research throughout Canada.

### 5. Meteorological Development

---

The importance of meteorological information to air navigation cannot be overestimated, and arrangements have been completed with Sir Frederick Stupart looking towards the necessary developments of the meteorological reports, the undertaking of meteorological observations at air stations operated under the Air Board, and the distribution of meteorological information.

### 6. Wireless Installations and Navigators' Certificates

---

The development of air navigation will involve a considerable extension of wireless communication, and arrangements have been made with the General Superintendent, Government Radio Telegraph Service in the Department of Naval Service, for this purpose. Air pilots who require wireless qualifications will obtain them through that department, by which will be issued licences for the necessary installations both in aircraft and on the ground. That department has an organisation extending throughout Canada, and duplication of officers is thus avoided. **Like arrangements are expected to be made with the Department of Marine and Fisheries for the issue of navigators' certificates to air pilots who desire or need them. The existing organisation under that department extends throughout Canada, and undertakes the examination and qualification of marine navigators.** As the problems met with in air navigation are very similar to those which present themselves in marine navigation this arrangement is expected to be both economical and satisfactory.

### 7. Aircraft and Equipment

---

Negotiations have been entered into looking towards the taking over by the Air Board of the seaplane stations erected during the War by the Department of the Naval Service at Halifax and Sydney, and that portion of Camp Borden which was developed as an

## Notes on "Civil Aviation"

aerodrome by the Royal Air Force and acquired by the Department of Militia and Defence after the conclusion of the War. The equipment, which will come under the control of the Air Board from these sources, has an estimated value of \$170,000. In addition to the aircraft and equipment thus acquired, 16 machines of an approximate value of \$100,000 are being received from the Air Ministry by way of replacement of those presented from time to time during the War to the Canadian forces through the activities of the Overseas Club, and the Imperial Government is also presenting to Canada aircraft and equipment of the value of about \$5,000,000, **including 80 aeroplanes, 14 flying boats**, 12 airships, 6 kite balloons with inflating plants and sheds, 300 motor and other vehicles and a substantial amount of armament, wireless instruments, cameras and other technical **and general stores**. A considerable part of this gift has already been shipped, and shipment of the remainder will not be long delayed.

### 8. Mapping

---

At the request of the Air Board, the Dominion Geographer has commenced the preparation of aeronautical maps on the system laid down in the Convention relating to International Air Navigation. Flight , page 574, May 27, 1920.

The process of completing the mapping of Canada on this system will necessarily be a very long one.

### 9. Canada's "Air Force"

---

The question of the constitution of a Canadian Air Force was an early subject of consideration by the Air Board, and on December 22 there was adopted for submission to Privy Council, a memorandum covering the general lines of the organisation proposed. A final decision on this subject was, however, postponed until the general policy which regard to Canada's future sea, land and air forces was determined, and it has consequently not been possible to take any further steps in this direction. The very large number of ex-officers and airmen of the Royal Air Force in Canada are expected enthusiastically to support the proposals if it is found possible to adopt them.

### 10. Aeronautic Intelligence

---

The Air Board Act imposes upon the Board a duty " to study the development of aeronautics in Canada and other countries." In the execution of this duty the Air Board has had the advantage of the work done before its constitution by the Intelligence Branch of the Canadian Air Force under the Ministry of Overseas Military Forces of Canada.

This branch, during the two years of its existence in London, had collected material of very great interest and value, and its papers were, in the course of demobilisation of the Canadian Expeditionary Force, transferred to the Air Board, which also secured the services of one of the officers chiefly responsible to its administration.

## Notes on "Civil Aviation"

The Air Board, consequently, has available fairly complete sets of drawings of almost all standard British machines, engines and equipment, with specifications for the construction of many of them, and has also an adequate collection of technical publications, reports and documents.

The Intelligence Branch of the Canadian Air Force, O.M.F.C., established communication with the chief aircraft manufacturing companies, and this communication has been maintained, with the result that the Air Board secures early information of developments in design and of inventions having an importance from an aeronautical point of view.

With this material it is able to deal with the problems which present themselves to commercial and other companies, and which require solution in connection with operations undertaken on behalf of the Government.

The theory of 'continuing' sovereignty, as explained by Professor Dicey, is that there are no limits to the legislative competence of Parliament. Each Parliament is absolutely sovereign in its own time and may legislate as it wishes on any topic and for any place. That which has been enacted by Parliament has supreme force and cannot be invalidated or changed by any other domestic or external authority. As so outlined, the doctrine has been the very foundation of the British constitution since at least the latter days of the nineteenth century.

As a general rule, if an Act is partially or wholly inconsistent with a previous Act, then the previous Act is repealed to the extent of the inconsistency. It does not matter that the later Act contains no express words to affect the repeal or alteration. This is known as the doctrine of implied repeal.

Treaty-making powers rest in the Crown, acting on the advice of its Ministers and their actions can not be challenged or questioned in the courts.

No Parliament could bind its successor, so the Treaty of Rome (which once signed was irrevocable), could be reversed by a subsequent Parliament.

Lord Salmon said of Parliament's legislative powers that

"...it can enact, amend and repeal any legislation it pleases." - Blackburn v Attorney-General (1971) CA

A statute could not be challenged on the grounds that it was illegal, or made for an unlawful purpose, for if this were possible the supremacy of Parliament would be denied.

While there was a general presumption that Parliament would not wish to override the UK's international obligations it certainly had the power to do so, where an Act conflicts with a Convention the Act prevails. - Cheney v Conn [Inspector of Taxes] [1968] Chancery Division

Legislation passed using the Parliament Acts is not subordinate legislation but primary legislation. - Jackson v Attorney General [2005] HL

"Are we to act as regents over what is done in Parliament with the consent of the Queen, Lords and commons? I deny that any such authority exists. If an Act of Parliament has been obtained improperly, it is for the legislature to correct it by repealing it: but, so long as it exists as law, the courts are bound to obey it." - just. Willes J, Lee v Bude & Torrington Junction Rly Co (1871)

A reference to the ECJ would not be ordered since it was a matter for the national court whether such discrimination was justified. - Parliamentary sovereignty - effect of EC law - a national of an EEC Member State, Macmahon v Department of Education and Science [1982] CD

Parliamentary debates could be used in interpreting delegated legislation. UK legislation should be interpreted in accordance with EC Law. There is a presumption that Parliament will not pass legislation that would conflict with the UK's international obligations. - Pickstone v Freemans PLC [1988] HL

## Notes on “Civil Aviation”

*The majority of commercial aviation firms operating in Western Canada do not keep their log books up to date, and in many instances have no information whatsoever about repairs or replacements to aeroplane and engine during the previous flying season. The practice of keeping flying time in rough note books and on separate pieces of paper is mainly responsible for this neglect. Such note books and bits of paper usually appear to be of no importance if left scattered about and are, therefore, lost, or if kept in a safe place, the accumulation is so great at the end of the flying season that it is a very weary task to copy the whole into the log books and usually it is left undone. If log books were carried in the machine and entered up after each day's flying it would only be a five minute task, and the information about repairs and replacements would be accurately remembered and put down. In case the machine was being left out overnight the logbooks could easily be carried to his room by the pilot, instead of being left out to perhaps get rained on, or taken away as souvenirs by some prowler in the night. The importance of having available for inspection, a detailed history of the aeroplane and engine, both in regard to flying time and repairs, is absolutely necessary - for at the present time commercial aviation personnel seem very reluctant to give the Examiner any information which could be of assistance to him in carrying out his inspection - N.R.*  
Anderson, Canadian Air Board - Air License Inspector to L.S. Breadner, 21 June, 1922, found in Anderson's RCAF documents, National Personnel Records Centre, National Archives of Canada

### HISTORY, A DEFINITION WITH THREE DISTINCT MEANINGS.

History, according to one definition, is a word with three distinct meanings <sup>4</sup>.

History:

1. refers to actual events that took place
2. the memory of those events
3. the attempt to understand and interpret the surviving evidence.

The third kind of history is always written from the perspective of the present – even when the historian makes a conscious effort to avoid imposing contemporary values on the past.

### I Read, I Think : Therefore...

I read — Record “relevant information” about: \_\_\_\_\_ the subject or area of discussion.

I think — Record what “you know” about: \_\_\_\_\_ and what you “think” it means.

Therefore — Record your conclusions: \_\_\_\_\_ based on the evidence presented here and any prior knowledge you may have.

Ground Engineers were internationally recognised<sup>5</sup> and known to have been involved in UK Civilian aviation from well before the start of WW1. They were formally named and identified at the end of WW1 and ascribed unique duties and responsibility in the civilian world as well as within the British military service.

"The problem of aeronautics is no longer flight. It is education!" - Glenn Curtiss

<sup>5</sup> The United States National Advisory Council on Aeronautics - Bibliography of Aeronautics, 1920-1921 - PAUL BROCKETT Smithsonian Institution pages 13, 182 & 311

"This work covers the literature published from January 1, 1920, to December 31, 1921, and continues the work of the Smithsonian Institution issued as Volume 55 of the Smithsonian Miscellaneous Collections, which covered the material published prior to June 30, 1909, and the work of the National Advisory Committee for Aeronautics as published in the Bibliography of Aeronautics for the years 1909 to 1916 and 1917 to 1919.

As in the Smithsonian volume and in the Bibliography of Aeronautics for **the years 1909 to 1916 and 1917 to 1919, citations of the publications of all nations have been included in the languages in which these publications originally appeared.**

The arrangement **is in dictionary form with author and subject entry and one alphabetical arrangement.**

**Detail in the matter of subject reference has been omitted on account of the cost of presentation, but an attempt has been made to give sufficient cross reference for research in special lines.**

Joseph S. Ames, Chairman Executive Committee, National Advisory Committee for Aeronautics **09 December 1924**

# Canadian Aviation Time line

When viewed against the origins of similar activities, the history of Canadian law relating to the “Civilian aviation” is relatively recent. However it does not come without a prior foundation.

That foundation is directly tied to the history of the Laws of the British Empire and Canadian military law relating to the Canadian air force and subsequently, the origin of the British Empire’s military Air force.

Military aeronautics did not exist in Canada prior to World War I.

During World War I, Canadian air force personnel flew with British units. Discipline of British air units was governed by the United Kingdom Air Force (Constitution) Act 1917. The head of the British Empire - the United Kingdom had, in 1911, enacted an Aeronautics Act, amended in 1913, and then re-issued in April 1919 following the armistice that ended WW1.

The British flying services of the First World War never gave official status to the term ‘ace’ and one will never find an authorized list itemizing their scores. This practice recognized the injustice of singling out one category of combatant over another. - See more at: <https://legionmagazine.com/en/2015/09/air-force-the-fighter-pilot-who-hated-killing/#sthash.BbYh8sI3.dpuf>

World War I British pilots were usually commissioned officers. Non-commissioned officer pilots were a rarity until 1918, and were still greatly outnumbered by officers. And so by late 1919, the pilot’s trade had reverted to being an officer’s preserve. - See more at: <https://legionmagazine.com/en/2005/09/the-nco-pilots/#sthash.kpQ7EauU.dpuf>.

The world went to War in 1914 with primitive aircraft, they evolved rapidly and each year brought substantial changes in design and construction. Post WW1 the vast surplus went on the auction block - effectively becoming “Civilian” aircraft..

## BRITISH IMPERIAL AVIATION - 1803

1803 : Major John Money, urges the British Army to adopt Balloons, <sup>6</sup> his suggestion is not taken up by the military leadership of the day.

## BRITISH IMPERIAL AVIATION - 1806

1806 : The 10th Earl of Dundonald - Lieutenant **Thomas Cochrane**, R.N tows kites from the brigantine PALLAS off the French coast in order to release propaganda pamphlets.

## BRITISH IMPERIAL AVIATION - 1809

1809 : Captain Thomas Cooper's "Instructions for Officers" includes a section on the use of Balloons.

## BRITISH IMPERIAL AVIATION - 1819

1819 : Charles Rogier produces a document discussing *the merits of Aerial Bombing*. <sup>7</sup>

## BRITISH IMPERIAL AVIATION - 1846

1846 : Military Board formed to determine the feasibility of Samuel A. Warner's "Bombing Balloon". 2 Officers appointed to the board declare it Impractical.

<sup>6</sup> John Money, "A Short Treatise on the Use of Balloons and Field Observatuers in Military Operations" London, 1803

<sup>7</sup> Charles Rogier, 'A word for my King and Country : A treatise on the utility o Rocket Armament, assisted by Balloons" London, 1819

## Notes on "Civil Aviation"

### BRITISH IMPERIAL AVIATION - 1853

1853 : Henry Coxwell fails to convince the Government of the need for Balloons for military purposes.

### BRITISH IMPERIAL AVIATION - 1854

1854 : Crimean War. Colonel Lefoy recommends building a balloon at the School of Military Engineering for experimenting and tests. The military convene a Board of 9 Officers to consider the plan. They decide against its' implementation. Of the numerous suggestions submitted on the assorted duties of the Royal Engineers to the War Ministry during the Crimean campaign, one was *"to bomb Cronstadt from the air by means of an explosive laden balloon"* <sup>8</sup>

### BRITISH IMPERIAL AVIATION - 1855

1855 : Seige of Sevastopol : British Secretary of State for War writes to his Marshal in the Field, Lord Raglan, that *"a means for ascertaining the inner defenses and obstacles which may be encountered, could be determined by reconnaissance from a Balloon."*

### BRITISH IMPERIAL AVIATION - 1861

1861 : F. Miller, R.E undertakes a tactical study of the 1859 war and the French and Italian Army's use of balloons. The account is read before the members of the Royal Artillery Institution. <sup>9</sup>

### BRITISH IMPERIAL AVIATION - 1862

1862 : Lieutenant G.E Grover, R.E <sup>10</sup> : While at the Woolwich Arsenal, he experiments with the production of Hydrogen.

1862 : Captain F. E. Beaumont, R.E <sup>11</sup> attaches himself to the Federalist Army in the war between the Northern and Southern States personally observes the Operations of the Federal Balloon Corps in America. Beaumont helps to convince the War Office of the importance of, and need for, Balloons - if only on an experimental basis.

### BRITISH IMPERIAL AVIATION - 1863

1863 : Guillaume Joseph Gabriel de La Landelle fathers the term (noun of action) *"aviation"* by combining the Latin word for Bird *"avis"* with the suffix *"-ation"*. <sup>12</sup>

### BRITISH IMPERIAL AVIATION - 1866

1866 : F. H. Wenham enunciates the important principle that *the supporting force on an inclined surface being driven through the air is limited to a narrow area near the front edge* in a paper on "Aerial Locomotion." read at the first meeting of the Aeronautical Society of Great Britain

This fact, of course, suggested a large "aspect ratio." He also points out the desirability of superposing the supporting surfaces to obtain great lifting power.

**CANADIAN AVIATION - 1867**

1867 : Canadian "Common" Law

The federal government is granted sole jurisdiction over the "Militia, Military and Naval Service, and Defence" pursuant to section 91(7) of the Constitution Act 1867.<sup>3</sup>

In exercise of this jurisdiction, Parliament has enacted the National Defence Act, which is the governing statute of Canada's Military Forces.

The Second Division of that statute contains the Code of Service Discipline.

The Code of Service Discipline is a complete code of military law applicable to persons under Canadian Military service jurisdiction.

Also, under section 12 of the National Defence Act, the Governor-in-Council and the Minister of National Defence are empowered to make regulations for the organization, training, discipline, efficiency, administration, and government of the Forces, so long as such regulations are not inconsistent with the National Defence Act.

Under this authority, the government has promulgated the Queen's Regulations and Orders (QR & O).

The QR & O amplify the Code of Service Discipline and serve as the authoritative manual for military law in Canada.

The jurisdiction of the civil courts is not affected by the Code of Service Discipline, and persons subject to the Code may be triable in both military and civil jurisdictions.

In general, the law of Canada, which applies to all citizens, also applies to members of the Forces.

Therefore, the person who joins the service is still within the jurisdiction of the civil courts and, as a member of the Forces, is also within the jurisdiction of the military courts. In determining original jurisdiction, one must look at the three types of offences that apply to service personnel: first, those offences that are triable only by the civil courts; second, those that are triable only by a military tribunal; and third, those that are within the jurisdiction of both military and civil courts. In the first type of offence, when charged with murder, manslaughter, or sexual assault, the service person must be tried by the civil court, and cannot be tried under military law. The second type of offence involves those matters that are purely of a military nature. These include absence without leave, desertion, disobedience of a lawful command, mutiny, insubordination, and so on. The third type of offence involves matters of the civil law that are brought into the Code of Service Discipline under section 120 of the National Defence Act,<sup>9</sup> or certain offences under the Code of Service Discipline that may be triable in the civil courts with the consent of the Commanding Officer of the complainant.<sup>10</sup> Under section 120 of the National Defence Act, a member of the Canadian Forces may be tried under military law for any offence under the Criminal Code or any other act of the Parliament of Canada. Also, offences that are triable in civil courts, with the consent of the complainant's Commanding Officer, may be triable by military tribunal under section 120. In the case of offences brought under the Code of Service Discipline through section 120, the civil courts maintain jurisdiction whether or not the accused person is tried by a military tribunal. Section 61(1) of the National Defence Act states that "Nothing in the Code of Service Discipline affects the jurisdiction of any civil court to try a person for any offence triable by that court." Therefore, a member of the forces can be brought before a civil court and tried for a matter that has already been disposed of by the military under section 120 of the National Defence Act. The Act requires that the civil court shall, in awarding punishment, take into account any punishment that was imposed by the service tribunal.<sup>11</sup> Additionally, when the punishment of the military court was a sentence of imprisonment, upon conviction or acquittal by the civil court the military sentence is remitted.<sup>12</sup> However, these provisions do not eliminate the problem of double jeopardy and it would appear, at first glance, that section 61 of the National Defence Act violates section 10(h) of the Charter, which provides that: Any person charged with an offence has the right ... if finally acquitted of the offence, not to be tried for it again and, if finally found guilty and punished for the offence, not to be tried or punished for it again.

**CANADIAN AVIATION - 1878**

1878 : In the first half of the Nineteenth Century, there was little controversy over what was taught as most young people did not attend school and those that did were either attending very expensive private (public) schools or learning the 3 R's until the age of 11. If you went to the former, you were more likely to study Greek or Roman history than you were any British or Imperial history. But of course, the Greek and Roman historical experiences were often used as a substitute and learning aid for the leaders of what would become the British Empire. Parallels were often drawn between the experiences of Roman Consuls and Emperors and those of British politicians and Civil Servants. Greek and Roman theories of government were the only form of political discourse entertained for younger minds.

The British Empire was regarded as being the heirs to this classical tradition. However, it was hoped that by studying the two classical civilisations, the British might learn from their mistakes and keep their own Empire flowering and make it an even more

## Notes on "Civil Aviation"

successful empire than the Greeks and Romans had managed. It was no accident that British colonial architecture and art was far more likely to be influenced by these Mediterranean Civilisations than from any local or indigenous cultures that the British came in to contact with. The British Empire was evidence of a Classical Renaissance to Britain's ruling elite.

Those who were not fortunate enough to receive a private education would probably not receive any meaningful education at all. There were some private local village schools that could provide a basic education for a modest fee. Churches could provide subsidised education as they were keen to ensure that the population could access the Bible and understand Christian ideals. However, even these schools often asked for contributions from parents. Both of these kind of schools were only interested in teaching the basic 3 R's and often had multiple ages within a single classroom.

Another possibility was to gain a scholarship to a local private (public) school. In fact, this is the reason for the confusion of the names in the British educational system. These private schools were supposed to make places available to the public through scholarships based on merit - hence the name 'public' school. However, the vast majority of students were always fee-paying and most were full time boarders. The schools were often in imposing buildings away from large towns and cities.

Another option was the Grammar schools. These were also fee paying, but could be attended by non-boarders. There would still be a fee, but it was nowhere near as high as the private (public) school fees. These were for post 11 age ranges and did provide a broader curriculum often teaching more advanced maths, literature, science and humanities. They were still more likely to study Greek and Latin than French or German as they aped the educational standards of the private (public) schools.

These schools appealed more upwardly mobile families. It is in this category that the kernel of a meaningful history curriculum can be found. These sons, and occasionally daughters, were expected to fulfil the managerial and functionary jobs of empire. They might become NCOs or junior officers of less famous or popular army regiments or in the Royal Navy. They might have gone on to run the train stations, stores, post offices, telegraph stations, etc... These would become the middle class over time but it would be a painful and time consuming process. But it is in these grammar schools that the idea of teaching a national story came to have some prominence. The national story was a very simplistic and basic one. It would largely involve Kings and Queens, important battles and a positive spin on Britain's achievements to date. It was meant in no way to challenge the ruling classes and system in place, rather it was designed to support the system and explain why the country was the country that it was. Chronologically, this simplistic and non-controversial history would start to push further and further from the Tudors to the Stuarts to the Glorious Revolution and then into the era of Empire.

Generals and Admirals like Drake, Wolfe, Nelson and Clive were emphasised as heroes of the ongoing national story. The Revolution in the 13 colonies was portrayed as an aberration due to a dangerous slide to tyranny (a la the Roman Empire) by George III and his Prime Ministers. The Napoleonic triumph was used to contrast this slide to tyranny and demonstrate that Britain thrives when it pursues ideas of liberty and freedom. It was all very simplistic but also very compelling and easy to sell. It is no accident that the popular presses of the late 19th and early 20th century thrived on stories of imperial adventure and endeavour. This popular press became the spokesmen for imperial intervention as most of the 'educated classes' would have been taught little else to oppose those ideas.

"Blue Coat" Schools - Charity schools set up by the churches to provide education for those who might not be able to afford it. The "blue coat" refers to the uniform that was supplied to the students attending. It was expected that most of the students "Blue Coat" Schools would learn a trade, but some could and did go on to University.

Schoolmasters were expected to teach a range of ages and abilities - although usually for payment of some kind. This meant that it tended to be the children of the more well to do who would be educated. Although the very wealthy might have governors or governesses dedicated to their children's education.

Village Schools - Very often, the older students were employed to teach the younger ones. All ages would be taught by the same teacher in the same room up until the age of 11 in most cases.

1878 : Canada : James Loudon, educator, physicist (b at Toronto 24 May 1841; d there 29 Dec 1916). President of the University of Toronto from 1892 to 1906, Loudon devoted his life to the university. Gold medalist in **MATHEMATICS** in 1862, he became tutor in mathematics at University College in 1863 and the first Canadian professor of the university in 1875, succeeding his teacher John Bradford Cherriman. In 1873 he was elected to the university senate. In 1878, at Loudon's recommendations, the School of Technology (renamed the School of Practical Science) was affiliated with the university.

## Notes on “Civil Aviation”

The Ontario School of Practical Science was established in 1873 by order of Provincial Parliament, and began a full program of study in 1878. The School had a general mission to promote and enhance the industrial and economic capacity of the still new Province of Ontario and, in a larger sense, the Dominion of Canada as a whole. The University of Toronto already existed at this time as an arm's-length, self-funded institution of higher learning under the auspices of the Province. It was, however, still primarily focused on traditional modes of intellectual pursuit and had not developed an interest in applied knowledge for the new industrial economy. Lacking an established Chair in the civil engineering discipline, the course in Civil Engineering consisted primarily of theoretical, academic sciences. Because of this, and the desire to ensure that the new school could focus specifically on practical applications of the sciences, the School of Practical Science was established as a separate, but complimentary, entity to the University of Toronto. The legislative paperwork was signed into law in January 1871 by the government of Sandfield MacDonald. In 1873 the Government of Oliver Mowat, following Blake's lead, took the legislative steps to create a full school for “mining, engineering, mechanics and manufactures” that would be fully controlled by the Provincial Government but which would have, from its outset, a strong link to University College at the University of Toronto. Thus, what would become the Department of Civil Engineering at the University of Toronto had been founded as the Ontario School of Practical Science. The Ontario School of Practical Science was built in 1877-1878 in full conjunction with the University of Toronto as the Applied Science Department of University College. Following some politically intriguing debate, John Galbraith, BA., MA., University College, was hired to be the first Professor of Engineering and would become the School's champion for years to come. Galbraith had come highly recommended by his peers and professional associates, having built himself a successful engineering practice with ties to the railways, mechanics, and other public projects. He formally took office on September 28, 1878, just in time to begin teaching that year.

The School of Practical Science offered a three-year practical diploma program in three areas: Engineering (meaning Civil, Mechanical, and Mining Engineering), Assaying and Mining Geology, and Analytical and Applied Chemistry. The School also offered a one-year certificate program in Surveying. In its first year, the School saw 8 full-time regular engineering students; this grew to 12 by the following year. Enrollment rose steadily despite tuition fees of \$80 per year, including books and laboratory fees. In 1884 the University of Toronto Senate established a new professional Civil Engineer degree designation in place of the old certification offered by University College. The new degree formally required the completion of the three-year SPS diploma in Civil Engineering along with three years of work experience and the completion of a formal thesis (with drawings) on a topic related to the field. In 1892 the SPS began to offer an optional fourth year, the completion of which would allow graduates to become eligible to apply for the new Bachelor of Applied Science designation at the University. In 1900 ties between the School of Practical Science and the University of Toronto had become so close and intertwined that it would no longer be prevented: the SPS was dissolved and formally became the Faculty of Applied Science and Engineering at the University of Toronto. By 1909, the three-year diploma originally offered by SPS was phased out, making way for a new, mandatory four-year degree program leading to the Bachelor of Applied Science degree fully certified by the University. Source ref - <http://civil.engineering.utoronto.ca/alumni/history/>

usually explained by claiming that the engineering profession, new and still professionalizing, sought association with the University to achieve credibility and status, and that the amalgamation represented an “academicizing” of the School's practical engineering education. But a close look at relations between the two institutions tells a different story. It was the University, not the School, that sought the association, for the University had at least as much, if not more, to gain as did the School. Further, despite an administrative convergence between the two institutions in the years prior to their amalgamation, the School stayed true to its founding purpose as a practical, professional school, academically distinct from the University. The School of Practical Science was the creation not of a young profession seeking better training and status, but of a province trying to boost economic growth.

## Notes on "Civil Aviation"

It was first proposed in 1871 by a two-man commission established by the Sandfield Macdonald government to investigate science and technology schools in the United States, with a view to creating such a school in Ontario. the government continued

to be wary of the heavy cost of its operation and uncertain about its relations with the University. When it did open, the new school, reflecting these concerns, was a dual-purpose institution—a provincial professional school, paid for by the government (but on the university campus where, to save money, it could make use of the nearby University College professors as instructors) and, at the same time, a new university building that provided teaching and laboratory space for the college professors and their students. It did have its own board, but this consisted of the School's instructors, nearly all University College professors. in

the fall of 1889, a full program in mechanical engineering, renamed electrical and mechanical in 1892. There were in 1905 some 1200 students in Arts (including Sciences), 650 in Medicine, and nearly 500 in Applied Science and Engineering—the three main faculties of the new University. The University brought tradition, authority, and high standards of book-based scholarship. The SPS brought utility, connections with the real world, and a nearly thirty-year tradition of provincial government support. SPS students spent ten to fifteen hours every week—about one third of their time—on "Engineering Drawing," in which they learned and practised drawing, lettering, cartography, and descriptive geometry (a method of finding graphical solutions to complex mathematical problems). University students took no such thing. SPS students also had a practical experience requirement in their program s that university students did not have. The School's own certificate was the SPS Diploma, awarded after completion of the three-year program ; with this, the University had no involvement. But in 1884, the University began to offer a C.E. (Civil Engineer) degree to working engineers; the requirements were a three-year SPS diploma, three years of work experience in civil engineering, and an essay (including drawings) on an engineering subject. It superseded an old degree that had been available at University College since 1851 but which only seven men had ever obtained. The C.E. was more of a formal professional designation than a true degree, but it was awarded by the University nonetheless. the B.A.Sc., a university degree introduced

in 1892 for students who took an optional fourth, post-diploma year, and completed a thesis. The force behind the creation of this

degree is hard to identify, but it seems to have been primarily a need to offer more instruction than could fit into the three-year program. Then, in 1909, the three-year course and the diploma were terminated; students entering that fall had no choice but to begin a four-year program that led to a university B.A.Sc. Most students were by this time taking the optional year, and the SPS itself, of course, had ceased to exist in 1906, so the three-year diploma no longer had a purpose. But the end of the diploma did not mean the end of the School's academic independence. Although a university degree, the B.A.Sc. belonged in practice only to the Faculty of Applied Science and Engineering; the Faculty always set its requirements, and nobody other than Faculty graduates could receive it. Several United States historians who have studied the origins of the modern university (the "American university," they call it) see "utility" and "research" as two distinct streams. This perspective is helpful in the present instance. In social science, for instance, research was practical from the start (We have Mackenzie King's sojourn at Chicago to remind us of that.) And science was, of course, never entirely "non-useful." But by and large "utility" in universities meant vocationalism—professional schools teaching usable skills rather than imparting culture. Research as a scholarly ideal was something else. It, too, entered universities in the late-nineteenth century, but not through the professional schools. It was the conviction that utility should be part of the University's character, not a belief in the research ideal, that made the commissioners of 1906 believe

that joining the SPS to the University of Toronto was the right thing to do. - **Source Ref : Richard White - Professionals and Academics: Relations Between the School of Practical Science and the University of Toronto, 1878-1906.**

1878 : British War Office gives authority for the formation of a Royal Engineer establishment at Woolwich Arsenal to develop experimental balloon and field equipment for "Practical" purposes. *Royal Engineers, Captain H.P Lee and Capt. J.L.B Templer appointed for the purpose and given 150 pounds for construction of a balloon.* <sup>13</sup>

### British Civil Service Commission - Candidates for civil employment

---

The only way to stop the exercise of undue influence, absolutely, was to hand over the examinations to an independent authority that had no sort of connection either with the nominating ministers or with the heads of the departments (when the latter were not the nominating authority, who required the new recruits for the filling of vacancies on their respective staffs)—the independent authority being responsible only to Parliament.

This step was taken more than half a century ago by the creation of the Civil Service Commission, which had its origin in an Order in Council dated 21st May, 1855.

The appointment of this Commission marks quite an era in the history of the British Civil Service ; and it is not saying too much, at this distance of time, to assert that the proceedings of the Commissioners have been in all ways beyond reproach and beyond the faintest suspicion of undue influence, judging by the only criticism—the admirable results which have ensued.

Although the notable event does not mark the actual commencement of open competition for Crown appointments, it does practically indicate the opening of the door for ability as distinguished from undue influence and intrigue ; and it was very properly regarded as the " first step " in the right direction.

Candidates for civil employment were made to know that something more was required than mere political or other " influence."

This, at first, was necessary, as it still is in certain cases, to obtain nomination ; but it was useless without those qualifications for a post, the due possession of which must be determined by an impartial " Board," assisted by a staff of able examiners.

The road, therefore, was thus prepared for the eminently popular step which was taken fifteen years afterwards, namely, in 1870. An Order in Council was again the medium by which the great change was effected, and this order was dated the 4th June, 1870. From its operation, however, were exempted :

- (i) appointments, such as Commissionerships, made directly by the Crown ;
- (2) any appointments made by the Treasury under the terms of Section 4 of the Superannuation Act of 1859 ; and
- (3) new appointments as they might be termed (although they are not fresh appointments from outside) by promotion within the department.

As to the exemption marked (i), it still holds and for reasons that will be fully explained in Chapter V.

The exemptions under (2) also still apply, and these will be more fully dealt with in Chapter V ; but here it may be briefly stated that they relate chiefly to persons holding such expert or professional qualifications as could not easily and readily be determined by the Civil Service Commissioners.

As to exemption (3), obviously it would not be fair to bring promotion which a man has earned within a department to which he had already obtained access, under the operation of an open outside competition, for his " qualifications " would have been shown inside and not outside the Service.

It will be well to state at once that the instituting Order in Council of June 4th, 1870, just referred to, was cancelled by a subsequent replacing Order in Council dated 10th January, 1910 ; but before coming to deal with that, it will be interesting to trace the progress of the movement for what may be called the popularisation of the Civil Service in the forty years from 1870 to 1910.

The resulting sketch will make this chapter rather a long one ; but apology will not be needed for this, considering that the reader may probably regard it as the most interesting chapter in the volume.

For the purposes of open competition a distinction was made by the division of the clerical establishments of the Civil Service into two classes, called respectively Class I and Class II.

## Notes on "Civil Aviation"

The bulk of the departments were grouped under Class II, and some, considered more important, were placed under Class I. Rates of salary and promotions differed widely in the two classes. In certain departments, too, a subordinate and still lower-paid grade of assistants, called sometimes Extra Clerks and sometimes Temporary Clerks, Copyists, and Writers, were engaged. But the system generally was productive of many anomalies, and was rectified by the adoption of one introduced by a Commission of Enquiry, presided over by Dr. Lyon Playfair, m.p., and usually known and referred to as the "Playfair Commission."

Its recommendations led to the separation of the Service into a "Higher" and a "Lower" Division, entrance to which was obtained by open competitive success in separate examinations: the Higher Division examination being much "stiffer" than the Lower Division one; and the commencing and subsequent salaries being also appreciably higher.

Under the same system a sort of floating body of Men Clerks and of Boy Clerks was established and maintained, and they were required to do the less important work, and to work wherever their services might be required. It was laid down, too, that in the case of any increase in the personnel of an office the same system should be continued and perpetuated—distinction being made between the amount of superior and inferior work.

Thus it came about that the work previously done by Writers or Temporary Copyists should thereafter be done by Lower Division Clerks unless the work performed was really copying only—a species of labour requiring practically little skill or intelligence.

The "Copyist" system was found, however, to be unsatisfactory as first instituted, and bare of any advantage—or stimulus to excellence. Certain privileges were therefore added, such as the payment of an annual bonus, after eight years' service, and a gratuity in the case of retirement. The chance was also given of occasional access to the ranks of the Lower Division.

Under the Playfair system, however, there was practically an impassable barrier set up between the Upper Division and the Lower Division; and for that and other reasons it was not found that the "scheme" (Programme) worked satisfactorily. Subsequent enquiries were made by a Commission appointed in 1886, under the chairmanship of Sir Matthew White Ridley.

This Commission is commonly referred to, under the name of its president, as the "Ridley Commission," and taking certain departments seriatim, it issued several reports and made recommendations, some of which were adopted by the Government.

A clean sweep was nevertheless made of all preceding minutes, orders, and regulations by the Order in Council of January the 10th, 1910, some verbatim extracts from which will, with such interlineary comments as may be necessary, give the reader a good grasp of the present regulations for the admission of future entrants to the honourable position of Civil servants of the Crown.

It will be understood that this order relates only to what is called the Home Civil Service, and not to any Colonial Services or to the India Civil Service.

The preamble of the Order in Council of the 10th January, 1910, runs:

—  
"Whereas by several Orders in Council, . . . provision has been made for testing according to fixed rules the qualifications of persons who may seek, or be proposed, for appointment, either permanently or temporarily, to situations or employment in any of His Majesty's Civil Establishments, and for regulating the conduct of His Majesty's said Civil Establishments and the conditions of Service therein.

"And whereas it is expedient that so much of the aforesaid orders as is now in force should be consolidated, with certain amendments, into one Order in Council.

I

"I. Now therefore His Majesty, by and with the advice of His Privy Council, doth order, and it is hereby ordered that, as from the date of this order, so much of the aforesaid orders as is now in force shall be repealed, and that the provision following " (extracts from which we make) " shall have effect in substitution for them:

—  
"Provided that such repeal or substitution shall not affect the validity of anything done under or by virtue of such orders or any of them.

"Provided also that nothing in this order shall affect any right, privilege, or exemption enjoyed by any person in His Majesty's Civil Establishments under Regulations in force at the date of the passing of this order."

## Notes on "Civil Aviation"

These last two "provisions" are only in keeping with precedent so far at least as the Civil Service is concerned.

The new Pension Act, for instance of 1909, to which reference will be made later on, does not affect compulsorily anyone in the service prior to its passing, although old entrants had the option of voluntarily enrolling themselves under its provisions.

Government, in fact, is more scrupulous perhaps than private employers generally in strictly and honourably carrying out its undertakings.

What may be called a little "pressure" may sometimes be employed by the high administering departments, such as the Treasury, in order to induce the rapid adoption of changes; but a Civil Servant has only to "insist" firmly upon his "rights," bestowed by Act of Parliament, Order in Council, Treasury Minute, or other authoritative pronouncement, to secure absolute attention to them.

In this respect Civil Servants are in a much more independent position than those in employ outside the charmed circle of His Majesty's Service; and this is a general factor of importance to be considered by would-be entrants.

We will now proceed with the Order in Council of the 10th January, 1910:

—  
"2. Such persons as His Majesty in Council shall have approved shall be His Majesty's Civil Service Commissioners (hereinafter called the Commissioners):

- i. for testing the qualifications of the persons proposed to be appointed to any situation or employment in His Majesty's Civil Establishments,
- ii. and for testing, in conformity with regulations to be from time to time issued by the Army Council:
  - i. the literary qualifications of candidates for admission by means of competitive examinations to:
    - i. the Royal Military College at Sandhurst, and to
    - ii. the Royal Military Academy at Woolwich,
- iii. and shall hold their offices during the pleasure of His Majesty;
- iv. and shall have power, subject to the approval of the Lords Commissioners of His Majesty's Treasury (hereinafter called the Treasury) to appoint from time to time such assistant examiners and others as may be required to assist them in the performance of the duties herein assigned to them.

"Provided that any Commissioner appointed for the purposes aforesaid may, subject to the approval of the Treasury previously obtained, by writing under his hand authorise the Secretary for the time being to the Civil Service Commission to act as Commissioner at any time during the absence of any of the Commissioners or during any vacancy among the Commissioners or for such period during such absence or vacancy as may be fixed by such authorisation.

"The Secretary, when acting in pursuance of such authorisation, shall have all powers, duties, and authorities assigned by this or any future Order in Council to the Commissioners for the time being appointed for the purposes aforesaid."

This is a very salutary and necessary arrangement in the case of a body like the Civil Service Commissioners; because otherwise, owing to the sudden illness or death of a Commissioner there might be a serious delay, involving very considerable public inconvenience, in filling vacancies in the departments. The wheel of State must roll on and should not be, even temporarily, stopped by the illness or death of a Commissioner.

The order continues:

- "3. Subject to the provisions of Clause 7 of this order and to the exemptions specified in the schedule marked B, appended hereto:
- i. the qualifications of all such persons as may seek or be proposed for appointment, either permanently or temporarily, to any situation or employment in any of His Majesty's Civil Establishments shall, before they are so appointed, be tested by, or under the directions of the said Commissioners; and
  - ii. no person (save as excepted in the said Schedule B) shall be appointed to any such establishment until a certificate of his qualification shall have been issued by the Civil Service Commissioners declaring that he has satisfied them:
    - i. 1st, that he is within the limits of the age prescribed for the situation or employment to which he desires to be admitted;
    - ii. 2nd, that he is free from any physical defect or disease which would be likely to interfere with the proper discharge of his duties;
    - iii. 3rd, that his character is such as to qualify him for such situation or employment; and
    - iv. 4th, that he possesses the requisite knowledge and ability to enter on the discharge of his duties'

## Notes on "Civil Aviation"

The text of Schedule B which sets out the exemptions from the operation of the open-competition system is as follows :

- (i) All situations to which the holder is appointed directly by the Crown ;
- (2) All situations included in any order or warrant made by the Treasury under Section 4 of the Superannuation Act, 1859 'y
- (3) All situations which are filled, in the customary course of promotion, by persons previously serving in the same department ; and
- (4) All situations which have already been added to the Schedule B, attached to the Order in Council of 4th June, 1870, and have not since been withdrawn therefrom."

Section 4, just alluded to, of the Superannuation Act of 1859, is as follows : " It shall be lawful for the Commissioners of the Treasury from time to time, by any order or warrant, to declare that for the due and efficient discharge of the duties of any office or class of offices to be specified in such order or warrant, professional, or other peculiar qualifications, not ordinarily to be acquired in the public service, are required, and that it is for the interest of the public that persons should be appointed thereto at an age exceeding that at which public service ordinarily begins ; and by the same or any other order or warrant to direct that when any person now holding or who may hereafter be appointed to such office or any of such class of offices, shall retire from the public service a number of years, not exceeding twenty, to be specified in the said order or warrant, shall, in computing the amount of superannuation allowance which may be granted to him under the foregoing section of this act, be added to the number of years during which he may have actually served, and also to direct that in respect of such office, or class of offices, the period of service required to entitle the holders to superannuation may be a period less than ten years to be specified in the order or warrant ; and also to direct that in respect of such office, or class of offices, the holder may be entitled to superannuation, though he may not hold his office directly from the Crown, and may not have entered the service with a certificate from the Civil Service Commissioners ; provided always that every order or warrant made under this enactment shall be laid before Parliament."

### A Civil Service Commission

"attends to the proper conduct of examinations of those who present themselves as candidates for employment under Government."

## CANADIAN AVIATION - 1886

### The "Playfair system" and the "Ridley Commission"

Under the "Playfair" system, however, there was practically an impassable barrier set up between the Upper Division and the Lower Division ; and for that and other reasons it was not found that the "scheme" (Programme) worked satisfactorily. Subsequent enquiries were made by a Commission appointed in 1886, under the chairmanship of Sir Matthew White Ridley. This Commission is commonly referred to by the name of its president.

## CANADIAN AVIATION - 1888

## Notes on "Civil Aviation"

1888 : **Aerial Arm of the** Royal Engineers **established to investigate lighter than air craft**. R.E balloon school established in Chatham, Kent, England.

### CANADIAN AVIATION - 1889

The Interpretation Act - 1889

### CANADIAN AVIATION - 1890

1890 : Royal Engineers' balloon school is relocated to Aldershot where the Royal Engineers form a permanent balloon section and depot.

09 October 1890 : Clement Ader of France builds and flies "Eole" a steam-powered, bat-winged "Avion" mono-plane.

1890 Sir Hiram Maxim carries on a series of experiments on a captive machine of large size. The plane had a total lifting surface of 6,000 square feet and weighed 8,000 pounds. It was driven by two specially designed steam engines weighing 310 pounds and capable of developing ??? horse-power. lifting effect of 3,000 to 4,000 lbs was obtained, and on one trial the machine broke away from its upper guide rails.

### CANADIAN AVIATION - 1900

02 July 1900 : Lake Constance, Germany. Count Von Zeppelin, a former cavalry officer successfully flies the 1st rigid Air-Ship from his company's facility. By 1914 the Zeppelin will have advanced to a practical (meaning a successful flying machine) design with military capabilities.

### CANADIAN AVIATION - 1902

1902 : Wallace Turnbull builds Canada's first wind-tunnel.

1902 : Nationalism and patriotism began to reach its hallmark in the Edwardian period when schools are encouraged to extend the leaving age.

1902 : The Balfour Act assumes control of all Grammar schools for the first time.

Up until this time, they had been charitable or locally provided schools. Local Education Authorities were set up to systematise the provision of education - although most students still left school at 11 and with very little historical education at all. But more did stay on, some went to higher elementary schools to learn more maths and science but the number who went to grammar schools increased too. The curriculum was now supposed to be under the control of these LEAs but they tended to keep and maintain the patriotic elements of the old charity schools. - Src: <http://www.britishempire.co.uk/article/historyteaching.htm>

### CANADIAN AVIATION - 1903

1903 : United States - Washington D.C

Samuel Pierpont Langley is secretary of the Smithsonian Institution and a "scientist of flight".

1. Langley studied the flight of birds for years.
2. in the late Langley 1890s had flown "a model" of his "aero-drome" almost a mile in powered heavier-than-air flight. <sup>14</sup>
3. in 18XX Langley commissioned the design of a special "light weight" gasoline fueled engine for his Aerodrome - a water cooled "Radial Engine" which revolves around a fixed point.
4. Nine days before the Wright brothers' first flight, Langley catapults his full-scale "Aerodrome", with a pilot aboard, from a houseboat in the Potomac River for its' first test flight.

<sup>14</sup> <http://history.nasa.gov/SP-4103/ch1.htm#n4>

## Notes on "Civil Aviation"

### 5. The "manned Aerodrome":

1. Is a scaled up version of Langley's successful "model"
2. Is not designed to withstand the forces applied by the catapult.
3. suffers structural failure at launch and collapses in the air, crashing into the Potomac.

Langley and Co. are "ridiculed in the press" over the failure of his Aerodrome - "overshadowing, for a while, the unheralded success of the Wrights a few days later".<sup>15</sup>

23 March 1903 : The Wrights *file for a patent* on their flying machine

1903 : United States :

"The brief notice of Lilienthal's death which appeared in the telegraphic news at that time, aroused a passive interest which had existed from my childhood, and led me to take down from the shelves of our home library a book on "Animal Mechanism" by Professor Marey, which I had already read several times.

From this I was led to read more modern works, and as my brother soon became equally interested with myself, we passed from 1) the reading to 2) the thinking, and finally to 3) the working stage"- Wilbur Wright

**The 3 points Wilbur made and some questions on their order are important to note:**

### 1. The "Reading" stage :

1. What were they reading ?
2. Where did their "Reading material" come from ?
3. Did they subscribe to International journals ?
4. Did they exchange letters with other "Aerial Experimenters"
5. Who were these "Other" Aerial Experimenters ?

### 2. The "Thinking" stage : What were they thinking? or Were they more likely "logically Contemplating" and organising:

1. what had been tried & done and what worked vs
2. what had been tried & done that didn't work in order to determine
3. what had not been tried and therefore might or might not work

"It seemed to us that the main reason why the problem had remained so long unsolved was that *no one had been able to obtain any adequate practice*"- Wilbur Wright

### 3. The Working stage :

1. What did they do?
2. What steps did they take?
3. How did they ascertain that their ideas were sound?
4. What models did they make?
5. How long was their "Apprenticeship"

To the general populace, yet unaware of the Wrights' "scientific" research, it appeared that science had been bested by mechanics, scholarship and erudition humbled by mere cleverness and inventiveness.<sup>16</sup>

23 March 1903 : Wright brothers file basic patent a "wing warping" technique of lateral control in which the wings are "twisted in opposite directions to create a differential lifting force" - the same result achieved later by Glenn Curtiss using ailerons - a French invention...

<sup>16</sup> <http://history.nasa.gov/SP-4103/ch1.htm#n4>

## Notes on "Civil Aviation"

### CANADIAN AVIATION - 1904

1904 : creation of Empire Day by Lord Meath as a way of popularising the concept of Empire. It was to be held on Queen Victoria's birthday, despite the fact that she had died three years earlier.

Empire Day was an idea taken from the dominions - Canada had been celebrating Queen Victoria's birthday since 1845.

Teachers and headmasters were encouraged to develop assemblies and lessons with pan-imperial themes. The students would then be rewarded with a half day off to celebrate the institution. This showed that the government was happy to patronise and expand on imperial themes especially in the aftermath of the Boer War but also with the rising Empire of Germany to face. Educational policy and popular culture were being harnessed to help foreign and defence policy.

21 May 1904 - Scientific American - Vol XC No. 21 - MUNN & CO., Editors and Proprietors - Published Weekly at No. 361 Broadway, New York. : The Aeronautical Institute of Great Britain proposes to carry out in the latter part of this year a series of trials with screw propellers designed for aeronautical purposes.

The trials are to be held in London, in some convenient building of suitable size so as to secure immunity from interference by variations in the force and direction of air currents.

The method of testing the propellers is to attach them to a motor provided with a carriage of known weight, which will be driven by the propellers along wires or rails.

The run will be as long as possible, and it is hoped in this way to secure valuable knowledge of the action of propellers, which cannot be gained by any other than a straightaway test such as this.

It is proposed at first to test only rotary propellers and those up to about four feet in diameter.

For this purpose, the Aeronautical Institute will provide a motor of from one-quarter to one-third horse-power, together with all the other necessary apparatus except the actual propellers, which will be supplied by those desirous of participating in the tests. Silver and bronze medals are to be awarded to the successful competitors.

### CANADIAN AVIATION - 1905

1905 : Federation Aero Nautique International "FAI" founded in France.

11-12 February 1905 : Englishman Hubert Latham accompanies his cousin, French balloonist Jacques Faure on a night crossing of the English Channel in a hot-air balloon.

### CANADIAN AVIATION - 1906

1906 : Mr. Beverley Shenstone born in Southern Ontario.

22 May 1906 : Wright brothers "basic patent" for a "wing warping" technique of lateral control in which the wings are "twisted in opposite directions to create a differential lifting force" is granted.

22 May 1906 : Patent Number 821393 is granted to the Wrights.

Langley seemed to contemporaries "a professor wandering in his dreams"; the Wrights were "known merely as practical mechanics" <sup>17</sup>

### CANADIAN AVIATION - 1907

March 1907 : First technical paper on Aircraft stability published by Canadian Wallace Turnbull.

1 June 1907 : Frank Whittle is born

5th October 1907 : first public flight of the British military semi-rigid airship (British Army Dirigible No. 1) 'Nulli Secundus' (Second to none) - Royal Engineers Balloon School, Farnborough. Britain's first military aircraft. Its initial design was

---

<sup>17</sup> Gibbs-Smith, The Aeroplane, p. 59. The characterizations of Langley and the Wrights are from Mark Sullivan, Our Times, 1900-1925 (6 vols; New York: Charles Scribner's Sons, 1926-1935 [1971]), 1: 566, 568.

## Notes on “Civil Aviation”

carried out by Colonel James Templer (who formed the first British military ballooning establishment at Woolwich in 1878) and was completed by Colonel John Capper (head of the Royal Engineer's Balloon Factory) and the American, Samuel Cody (the pioneer aviator who also designed the man-lifting kite and the the first aeroplane to fly in Britain - piloted by himself). The airship was built at the balloon factory in Farnborough and made its first test flight on 10th September 1907. Her first public outing was made on the 5th October when Capper and Cody flew her from Farnborough to London. After flying over the city, she circled St Paul's Cathedral and then attempted to return to Farnborough, but strong headwinds caused her to land at Crystal Palace. The flight covered 50 miles and lasted 3 hours, 25minutes.

### CANADIAN AVIATION - 1908

1908 : **Mr. H. Short**, Mr. Oswald Short & Mr. Eustace Short found Short Brothers, London, England.

1908 : Experiments in Aeroplane “automatic stability”.

Mr. L.D.L Gibbs conducts experiments for the British Imperial War Office at Blair Atholl using an aeroplane designed by Mr. Dunne. **[the D.1?]**

1908 : Wright’s first publicized demonstration flights.

8 August 1908 : **Wilbur Wright**'s effortless banking turns and ability to fly in a circle amazed -flight of one minute 45 seconds - stunned onlookers at the Hunaudières track near **Le Mans, France** including **Louis Blériot**. the Wrights silenced European doubters.

1908 : Mr. Hubert Latham, a British gentleman of inherited wealth, engineer Leon Levavasseur and businessman Jules Gastambide team up to promote and exploit Levavasseur’s engine and aeroplane design, the “Antoinette” monoplane. The aeroplane [and the engine] is named after Gastambide's daughter. The aer-craft is powered by a Levavasseur engine originally used in a boat Mr. Latham had raced in Monaco which was also called 'Antoinette'.

## Notes on "Civil Aviation"

### CANADIAN AVIATION - 1909

19 March 1919 : Olympia Aero Show, 1st British Aero Show : Monsuier Seguin displays for the 1st time in England the "Gnome" engine. The gnome runs on Castor bean oil, weights 165 lbs and develops a reliable 50hp.

May 1919 : The steering drum on the Voison biplane (8 cly. E.N.V engine) owned by Mr. J.T.C. Moore-Brabazon slips at a "Crucial moment" while being flown at Shellbeach Aerodrome and the Voison is damaged. The Short Bros. are hired to accomplish the repairs, their first.

22 May 1909 : Hubert Latham makes a record flight of 37 mins. at the Chalons Camp some 90 miles east of Paris, where the Voisin brothers are based.

04 June 1909 : Hubert Latham again flies for 37 mins. at a height of between 20 and 25 metres. He displayed the utmost sang-froid while making this little trip, and during the second circuit, while passing over the heads of the spectators, he calmly takes his hands off the steering wheel, rolls a cigarette and lights it.

12 June 1909 : At 6:40 pm, Hubert Latham flies "Antoinette" uninterrupted at a height of 15-40 meters for 1h. 7m. 37s., thus setting up a new world's record for monoplane flight and beating all French records for monoplanes or biplanes. Apart from the Wright Brothers, the records for long flights which have hitherto been made were held by : Henry Farman, 20m. 19s. (July 6th 1908); Delagrangé, 29m.-54s. (August 6th, 1908); Paul Tissandier, 1h. 2m. (May 20th, 1909).

June - July 1909 : an "International Juridic Committee on Aviation" is organised at Paris <sup>18</sup>

Within the year began publishing the "Revue juridique internationale de la Locomotion atrieillie." <sup>19</sup>

The committee itself consists of jurists, lawyers and legal students in principal countries.

The national membership forms a national committee acting through a representative executive committee in Paris. This executive committee makes general studies upon a point of law and issues its preliminary decisions to national committees, which report back their opinions.

The importance of such work is shown by the experiences of the Institute of International Law.

Preliminary studies [by the Institute of International Law] have been the foundation of every international law codification in existence.

Beyond question, the committee's code *will be the basis* of diplomatic action *when time for that is ripe*.

The American committee consists of:

1. James Brown Scott, 2 Jackson Place, Washington, national delegate to executive committee;
2. Charles F. Beach, 95 rue des Petits- Charaps, Paris, national reporter;
3. Denys P. Myers, 40 Alt. Vernon Street, Boston, national secretary;
4. Arthur K. Kulin, New York City;
5. Gov. Simeon E. Baldwin of Connecticut,
6. George Whitelock of Maryland,
7. William W. Smithers of Pennsylvania,
8. Joseph W'heless of Missouri and
9. Ambrose Kennedy of Rhode Island.

July 1909 : Mr. Hubert Latham begins wearing an over-garment on top of his clothing that is made from the fabric used to make the protective garments of fencers in epee competitions. Latham's "White Flying Suit" [white cover-alls] is intended to protect him from being punctured by splinters from the wooden members of his aero-plane in the event of a crash. [Others pick up the idea]

July 1909 : Silver Dart flown is and crashed at Petawawa, Ontario before the officers and the deputy minister of militia.

---

<sup>18</sup> (Source ref AERONAUTICS, July 31, 1914. - pg. 20 THE INTERNATIONAL CODE OF AERIAL LAW)

<sup>19</sup> (Source ref AERONAUTICS, July 31, 1914. - pg. 20 THE INTERNATIONAL CODE OF AERIAL LAW)

## Notes on "Civil Aviation"

19 July 1909 : Daily Mail £1,000 prize for the first person to cross the English Channel in an aeroplane.

- French aviation pioneer Hubert Latham- French Pilot's Lic. No.9 - is the first person to attempt to cross the English Channel in an aeroplane. Flying an Antoinette IV, misses being the first man to fly the Channel by some 300 yards and is credited with being the first individual to land an airplane on water - when his engine failed mid-channel. The "Antoinette" was destroyed while being retrieved and a new aeroplane was requested by Latham to make another attempt at the £1,000 prize offered by the Daily Mail. Competitors for the £1,000 prize that day were Louis Bleriot and his monoplane [No 9] and Count Charles de Lambert with a Wright biplane. Lambert came equipped with a complete spare. Latham and Bleriot arrange for a race to take place at first light on the morning of July 25.

25 July 1909 : Daily Mail £1,000 prize for the first person to cross the English Channel in an aeroplane.

Latham's engineer Levavasseur failed to wake either his pilot or his team from their sleep in time to get the new Antoinette [No. VII] ready to fly at dawn.

Louis Blériot is aloft by 04:41 and crosses the 31 mile English Channel from Les Baraques, near Calais, France to Northfall Meadow at Dover, England without a watch or compass flying between 150' and 300' at approx 45 mph, arriving at about twenty minutes past five (French time) winning the Daily Mail's £1,000 prize. Police Constable Stanford being the only eyewitness of this landing of the first flyer to cross the Channel. Blériot arrival with terra-firma was rather abrupt; in fact, not only was the propeller broken, but the framework which carried the engine was also damaged."

French pilot's licence No.1 is issued to M. Bleriot.

Hubert Latham makes a second attempt to fly the straits in the new Antoinette [after being notified by Bleriot that Bleriot will "Share the Prize Money" if he can make the crossing] and is within minutes of landing at Dover when engine failure once again places him in the water - a few hundred yards short of land.

20-30 July 1909 : United Kingdom Aero-Club pilot's licence No. 1. issued to Lt/Col J. T. C. Moore- Brabazon

11 August 11, 1909 : First aircraft designed and built in Canada:

The Baddeck No. 1 flies 100 meters before crashing in front of officers and the deputy minister of militia at Petawawa, Ontario.

1909 : Great Britain:

Mr A.V. Roe, aero-experimenter, works on building a "Tri-Plane" with a 10hp J.A.P air-cooled engine - a first - on the Lea Marshes, UK.

Mr. Roe comes to realise that the tail of an aircraft should be raised while gaining speed for take-off. [most aircraft are flown-off in a stall at this period]. Incensed at being prohibited from using the "Public Commons and Parks" around London for his experimentation, he writes a letter to FLIGHT, complaining of "Unnecessary red tape" stating that his own personal aerodrome was "covered with stumps and that twice his machine had suffered damage by colliding with these obstructions" [was he complaining or was he trying to say that he could fly from the commons and parks as his machine would withstand the trees?]

1909 : Col. Templer, Commandant of the Balloon Factory, Farnborough - helps persuade Secretary of State for War - Lord Haldane - to press for the formation of a body of distinguished persons who could give guidance in aeronautical matters. The result is the British Advisory Committee for Aeronautics (ACA) being set up to advise the United Kingdom War Office and the Admiralty on

## Notes on "Civil Aviation"

matters relating to flight in UK military service. The National Physical Laboratory accomplishes much of the theoretical work, the Royal Aircraft Factory - Farnborough, the practical work.

British Advisory Committee for Aeronautics members:

1. Col. Mervyn O'Gorman, R.a.f - Farnborough as Superintendent 1909 - 1916

22 August 1909 : Reims, France - first international air race.

Eugène Lefebvre, Chief pilot for the Wright Company in France, is fined \$4 by the judges for "*displaying excessive recklessness and daring.*" The fine is from "for stunting" his air-craft towards and over the crowd.

7 September 1909 : Juvisy France :

Eugène Lefebvre, Chief pilot for the Wright Company in France, wins more recognition.

He becomes:

1. The first person to die *while piloting a powered airplane*, and
2. The second person to be killed *in a powered airplane* crash.

1909 : Handley Page becomes the first UK company created "*solely for the design and manufacture of Aeroplanes*".

19 October 1909 : South Farnborough, England : Royal Aircraft Factory staff <sup>20</sup> :

- I. Superintendent : . O'Gorman, Temp. Lt.-Col. M. J. P., C.B., Hamps. Aircraft Parks, R.F.C., T.F
- II. Assistant Superintendent : Heckstall-Smith. Temp. Maj. S., Hamps. Aircraft Parks, R.F.C., T.F
- III. Assistant Engineer Designs : Green, Temp. Capt. F. M., Hamps. Aircraft Parks, R.F.C., T.F
- IV. Assistant Engineer Production : Turner, Temp. Capt. G. B., Hamps. Aircraft Parks, R.F.C., T.F
- V. Assistant Engineer Physical Research : Not staffed / not named
- VI. Assistant Engineer Supplies : Maxwell, Temp. Lt. R. M. 8., Hamps. Aircraft Parks, R.F.C., T.F
- VII. Assistant Engineer Fabrics : Jones, Lt. B. M.. Load. Sig. Co., R.E

30 October - 01 November 1909 : Wright Aeroplanes built under license in Great Britain

Short Bros. complete the 1st license built Wright aeroplane [in the UK] which is delivered to Mr. C.S. Rolls at Shellbeach.

Their 2nd license built Wright aeroplane [in the UK] is sold and delivered to Mr. A. Ogilvie at Rye, Camber-sands.

<sup>20</sup> THE MONTHLY ARMY LIST - JUNE, 1916 pg 1515 - <https://deriv.nls.uk/dcn17/1080/0283/108002834.17.jpg>

**CANADIAN AVIATION - 1910**

1910 : Aircraft in the UK and elsewhere are being expressly designed to "Avoid infringing upon the Wright patents".  
The Wrights are bringing a large amount of expensive and fruitless litigation"<sup>21</sup> to those who infringe..."

4 January 1910 : Leon Delagrange is killed at Bordeaux, France when the wings on his Blériot mono-plane collapse in mid-air.

05 January 1910 : Herbert Chatley reads his aeronautical paper before the Institution of Civil Engineers of Ireland - in a follow up paper by him entitled "The Construction of an Aeroplane" read in his absence in 1912 "The President the Institution of Civil Engineers of Ireland said the Paper was one of "great interest upon a subject of great and growing importance."Enormous improvements had been made in a short time. At the end of 1910, there were no flying machines in the world, which would satisfy the specified tests laid down by the French Government for aeroplanes to be constructed for the army. Since then, very severe tests on 31 different types of machines were carried out by the French and nine different types successfully passed the tests. The tests required that each machine should carry 600 lbs, that it should fly at the rate of at least 37 miles an hour, that it should carry out, without stopping a flight of 186 miles, that it should be capable of starting from and alighting on three kinds of ground, first from stubble, second from a growing crop of lucerne (alfalfa), and thirdly from ploughed land. At that time, he said, the French government had 170 aeroplanes for the use of the army and 73 trained air-pilots. In France, the President of the Institution continued, the people are so positive that aeroplanes are the demand of the age that it has been proposed that the army should have a thousand aeroplanes at their service"

10 - 20 January 1910 : Los Angeles California : International Air Meet.

16 January 16, 1910 : The International Juridic Committee on Aviation decides upon the *outline text of an international "legal code of the air"* <sup>22</sup>, this "Code of the Air" comprises 2 "books" - which are neither formally adopted or implemented:

1. Book I. Public Aerial Law.
2. Book II, "Private Aerial Law"

**1910 INT'L JURIDIC COMMITTEE ON AVIATION : BOOK I - "PUBLIC AERIAL LAW"**

**Public Aerial Law - Chapter I : General Principles of Aerial Circulation** <sup>23</sup>

Article - 1.

Aerial circulation free, except for right of subjacent states to take certain measures with a view to own security and that of persons and property of their inhabitants.

Article - 2.

It is prohibited to pass above fortified and military works, etc., or neighbourhood within a radius determined by the military authorities.

Article - 3.

Administrative and police authorities regulate or prohibit circulation above built-over areas.

**Public Aerial Law - Chapter II : Nationality and Registration of Aircraft** <sup>24</sup>

Article - 4.

Every aircraft must have one nationality only.

Article - 5.

Nationality of aircraft that of owner. If aircraft belongs to a company, nationality that of headquarters of company.

---

<sup>21</sup> Dallas Brett, "Brooklands Developments " The History of British Aviation Vol. I - pg. 60-61 ; publisher - The Aviation Book Club, 32 Bloomsbury St. London WC1

<sup>22</sup> "THE INTERNATIONAL CODE OF AERIAL LAW" published in AERONAUTICS, July 31, 1914. - pg. 20

<sup>23</sup> "THE INTERNATIONAL CODE OF AERIAL LAW" published in AERONAUTICS, July 31, 1914. - pg. 20

<sup>24</sup> "THE INTERNATIONAL CODE OF AERIAL LAW" published in AERONAUTICS, July 31, 1914. - pg. 20

## Notes on "Civil Aviation"

If owners of aircraft are of different nationalities, its nationality will be that of joint owners who possess two-thirds value.

Article - 6.

Every aircraft must bear sign indicative of nationality.

Article - 7.

Every aircraft must carry descriptive document containing information proper to individualise.

Article - 8.

1. Every owner, before putting craft into circulation outside private aerodromes, must have obtained *from public authorities, inscription upon a register of matriculation* kept by [the] proper authority.
2. Each state regulates registration within own territory.

Article - 9.

Aircraft must bear distinctive mark indicating place of registration.

Article - 10.

Registration lists will be published.

### Public Aerial Law - Chapter III : Landing and Alighting on water <sup>25</sup>

Article - 1 1.

Aircraft may:

- (a) land upon unenclosed properties;
- (b) also alight upon and navigate all waters.

Article - 1 2.

Except in the case of "force majeure," this right is prohibited to them:

- (a) in the boundaries of closed properties;
- (b) within the boundaries of areas built over, ports and roadsteads, outside of spaces reserved for this purpose;
- (c) in navigable channels where the difficulty of passage necessitates this prohibition, which must be expressly formulated by the competent authorities.

Article - 13.

Every aircraft which enters above a prohibited zone is to alight at first signal from competent authorities as soon as possible.

### Public Aerial Law - Chapter IV : Jettison <sup>26</sup>

Article - 14.

Jettison consists in any voluntary throwing overboard of objects.

Article - 15.

Jettison of all nature to injure persons or property is prohibited, except in case of imminent danger.

Article - 16.

In any case, damage alone gives cause for reparation.

### Public Aerial Law - Chapter V : Wrecks <sup>27</sup>

Article - 17.

---

<sup>25</sup> "THE INTERNATIONAL CODE OF AERIAL LAW" published in AERONAUTICS, July 31, 1914. - pg. 20

<sup>26</sup> "THE INTERNATIONAL CODE OF AERIAL LAW" published in AERONAUTICS, July 31, 1914. - pg. 20

<sup>27</sup> "THE INTERNATIONAL CODE OF AERIAL LAW" published in AERONAUTICS, July 31, 1914. - pg. 20

## Notes on "Civil Aviation"

Whoever finds all or part of disabled and abandoned aircraft must make declaration thereof to proper authority.

Article - 18.

Competent authority, when duly advised, will immediately take the measures necessary to assure the preservation of wreck and discovery of owner.

Article - 19.

Owner of wreck:

- (a) may reclaim it from the authorities in charge within period of one year from discovery by paying expenses of preserving, in addition
- (b) he must pay finder premium of discovery calculated on the basis of 10 per cent, of value on the day of restitution, minus expenses.

### **Public Aerial Law - Chapter VI : Legislation applicable to Jurisdiction Competent in respect to Aerial Locomotion** <sup>28</sup>

Article - 20.

Aircraft which is above the high sea or territory not under the sovereignty of any state is subject to legislation and jurisdiction of country whose nationality it possesses,

Article - 21.

When an aircraft is above territory of a foreign state, the acts committed and the deeds occurring on board, which are of a nature to compromise security or public order of subjacent state, are regulated by the legislation of territorial state and judged by its courts.

Article - 22.

- I. Reparation for damages caused to the persons and goods above the territory of the subjacent state by an aircraft is regulated by the law of this state.
- II. The action for relief may be brought either before the courts of this state or before the courts of the state whose nationality the aircraft possesses.

Article - 23.

- I. Acts committed and deeds occurring in space on board an aircraft and which do not affect the security or the public order of the subjacent state remain subject to the legislation and the jurisdiction of the country whose
- II. nationality the aircraft possesses.

Article - 24.

- I. In case of a birth or a death on board during an aerial voyage, the pilot will make record thereof on the log-book.
- II. In the first place where the aircraft shall land the pilot will have to deposit a copy of the record which he shall have made. The deposit will be made as follows:
  - (a) If the place is part of the territory whose nationality the aircraft possesses, to the proper public authority;
  - (b) if the place is situated in foreign territory, in the hands of the consul whose nationality the aircraft possesses. In case there is no consul in this place:-
    - i) the copy of the record will be sent by the pilot by registered mail to the consular authority, or
    - ii) to the competent authority whose nationality the aircraft possesses.

### **1910 INT'L JURIDIC COMMITTEE ON AVIATION : BOOK II - PRIVATE (CIVIL) AERIAL LAW**

**TITLE I. : Civil Law**

**Private Aerial Law - Chapter I : Property Above** <sup>29</sup>

Article - 25.

<sup>28</sup> "THE INTERNATIONAL CODE OF AERIAL LAW" published in AERONAUTICS, July 31, 1914. - pg. 20

<sup>29</sup> "THE INTERNATIONAL CODE OF AERIAL LAW" published in AERONAUTICS, July 31, 1914. - pg. 20

## Notes on "Civil Aviation"

No one may, on account of a property right, hinder the passage of an aircraft under conditions which do not present for him any appreciable inconvenience.

Art.26.

Any abuse of the right of passage gives cause against its responsible author for action for damages.

### Private Aerial Law - Chapter II : Reparation for Damage caused by Aircraft <sup>30</sup>

Article - 27.

Reparation for damage caused by an aircraft either to persons or goods that are on the surface of the earth falls on the custodian of the aircraft, the right of the injured person to look to the one responsible at common law being unimpaired.

Article - 28.

The custodian, held to reparation for the damage done, has a recourse against the responsible author thereof in accordance with the common law.

Article - 29.

In case the damage should be due wholly or in part to the act of the person injured, the judge shall have the right to pronounce the total or partial exoneration of the custodian.

Article - 30.

The custodian may bring the exception of "force majeure" as a defense.

Article - 31.

The provisions of Art 27 are not applicable if, at the moment of the accident:

- I. the person injured or the thing damaged were transported by aircraft, or
- II. if the person injured was himself occupied in the management of the machine.

**NOTE :** The remainder of Book II, Private (Civil) Aerial Law, is yet to be worked out. <sup>31</sup>

March 1910 : Royal Aero Club issues Aeroplane Certificates - to Royal Engineers.

11 March 1910 : First flight of the "Dunne D.5" accomplished by designer J. W. Dunne at Eastchurch, England.

The Dunne is the first inherently stable aircraft in the world.

06 May 1910 : "**Camp de Chalons**", France.

The French War-office authorises aeroplane makers "the privilege of using Camp de Chalons as an aeroplane building / testing and pilot training ground" with the restrictions that "flying was to take place between certain hours, and was to be prohibited while the troops were at exercise".

Camp de Chalons then becomes a "great aviation centre to which pupils in the art of flying flocked" from all parts of the world.

1. nearly all the makers erected sheds between Bouy and Mourmelon,
2. Quite a large proportion of the visitors to the aeroplane makers are foreigners, and
3. it was reported that a number of German officers spent some time at Mourmelon in learning to fly ;
4. Flying machines were bought which presumably found their way to Germany.
5. The facilities thus offered to foreign military visitors to make a survey of the Chalons Camp and learn things that the military authorities would prefer to keep secret,

The French War-office now "discovers the distinct inconvenience" in allowing private aeroplane makers to use Camp de Chalons as a training ground. The private Aeroplane makers, their machines, students and customers are

<sup>30</sup> "THE INTERNATIONAL CODE OF AERIAL LAW" published in AERONAUTICS, July 31, 1914. - pg. 20

<sup>31</sup> "THE INTERNATIONAL CODE OF AERIAL LAW" published in AERONAUTICS, July 31, 1914. - pg. 20

## Notes on "Civil Aviation"

now regarded as presenting a serious danger to the French military at Camp de Chalons and restrictions are imposed which tie the hands of aviators.

Aeroplane makers are therefore forced to seek out new training grounds:

1. Henry Farman transfers his operations to Etampes [where he inaugurated his new school by sending Paulhan on a cross-country flight to Arcy-sur-Aube, a distance of 120 miles.]
2. Sommer transfers his operations to

A few days prior to Farman's move to Etampes a cyclone devastates Camp Chalons, demolishing several sheds and destroying the aeroplanes within them.

Sommer's shed was moved 100 hundred yards without the aeroplane it contained being damaged.

### 06 May 1910 : The "Foreign Airship Controversy"

The controversy between the advocates of dirigible balloons of the rigid and non-rigid types has revived as the result of the destruction of the new Zeppelin airship which was constructed with the money raised by a national subscription immediately after the loss of the first balloon of this type.

While the rigid airship was adopted in Germany as the most suitable for military purposes, and a strategical base was established near Hamburg where sheds have been built to accommodate these huge aerial vessels, the French have always shown themselves averse to the rigid type, and the military authorities have hesitated to create an aerial fleet until more is known as to the possibilities of the dirigible balloon.

Under pressure of public opinion, which became alarmed at the German activity in airship construction, the French Minister of War has placed orders for dirigible balloons, and is even reported to have acquired an option on the new Bayard-Clement airship which was to have attempted the journey from Paris to London with a view to its acquisition on behalf of the British Government.

The Astra Company is also completing a dirigible balloon for the French military department. Both of these vessels are fitted with two engines which can be run separately or together, while the substitution of wood for metal propellers and other improvements have been suggested by experience with the dirigible balloons already in military service.

So far as concerns the superiority or otherwise of the non-rigid over the rigid type, there are, as yet, insufficient data to allow of any definite conclusion being come to, for it must not be overlooked that the Patrie suffered the same fate as the two Zeppelins, and neither type is apparently able, on account of its bulk, to withstand strong gusts of wind.<sup>32</sup>

### 22 June 1910 : First commercial airship flight

The first commercial airship flight takes place, as the Zeppelin Deutschland (LZ 7) flies from Friederichshafen to Düsseldorf, Germany, with 20 paying passengers – 10 men and 10 women – on board. Count Ferdinand von Zeppelin is at Deutschland's helm.

13 July 1910 : German blimp "Erbslöh" explodes in flight Leverkusen, Germany, killing her entire crew of five.

### 14 July 1910 : Toronto Aerial Display

Count Jacques de Lesseps with his Blériot monoplane at the Trethewey farm, July 1910. City of Toronto<sup>33</sup>. The meet took place in July 1910, seven year years after Wilbur and Orville Wright had managed **their first successful (if brief) aeroplane flight near Kitty Hawk, North Carolina**. In the latter years of the 1900s, daring aviation pioneers made headlines across the world, experimenting with new aircraft, and making many more flights, some more successful than others. Torontonians' first real opportunity to see the novelty of powered flight came in 1909, when **Charles F. Willard** provided demonstrations at **Scarboro Beach Park**. By some standards, Willard's flights had been of limited success; although he managed to get his **Curtiss** "Golden Flyer" into the air on three occasions, each of his flights ended with uneasy landings in Lake Ontario.

---

<sup>32</sup> THE ENGINEER - MAY 6, 1910 pg 452

<sup>33</sup> <http://torontoist.com/2016/10/historicist-skys-limit/> The 1910 aviation meet and Count Jacques de Lesseps' flight over Toronto. BY **DAVID WENCER** OCTOBER 8, 2016

## Notes on "Civil Aviation"

In the summer of 1910, **Canada's first aviation meet** took place near Montreal, organized by the Automobile and Aero Club of Canada.

Though not financially profitable, the event attracted considerable public interest, with demonstrations and competitions featuring experienced pilots, most already famous for their flying exploits in other parts of the world. One week after the end of the Montreal meet, a second week-long event was held in Toronto, organized in part by the **Ontario Motor League**, featuring many of the same pilots and aeroplanes. The site chosen for the Toronto meet was owned by the Trethewey family, and was a functioning farm near **Weston**, just southeast of Jane and Lawrence. The relative novelty of aeroplanes meant that all the participating pilots had taken up aviation quite recently. **Ralph Johnstone**, **Walter Brookings**, and **Duval LaChapelle** were amongst several who came on behalf of the Wright brothers, who had assembled and trained their own, touring exhibition flying team earlier in the year. Others at the meet included **Gardner Hubbard**, described in the *Globe* as "a wealthy millionaire of Boston, [who] will bring a machine built by the McCurdy-Baldwin people of Baddeck, Nova Scotia," and **Cromwell Dixon**<sup>34</sup>, a 17-year-old pilot billed as the "boy aviator," who told the *Star* that he had been flying since he built his first dirigible balloon at age 13, but who had only first flown a monoplane at Montreal the week before. The most prominent aviator, however, was Count Jacques de Lesseps, the son of notable French diplomat **Ferdinand de Lesseps**. Jacques de Lesseps had made headlines earlier in the year when he made the second successful flight over the English Channel in "Le Scarabée," a monoplane constructed by French aviator and engineer **Louis Blériot**. De Lesseps had also made a name for himself at the Montreal aviation meet, when he had become the first to fly directly over a Canadian city.

### 27 August 1910 : First radio messages to the ground from an Aeroplane

pilots Frederick "Casey" Baldwin and John McCurdy flying a Curtiss biplane send messages to the ground via radio [W/T].

12 September 1910 : W.W. Gibson's "Twin Plane" Canada's first designed and built aeroplane "hopped" at Dean's Farm, Victoria BC.

22 September 1910 : W.W. Gibson : Twin Plane collision with a large tree , was not seriously hurt, and went on to build a much more realistic machine that flew several times in 1911 in Calgary. A further crash ends Gibson's pioneering efforts.

14 September 1910 : Zeppelin LZ 6 is destroyed by fire in her hangar at Baden-Baden, Germany.

September 1910 : The Bristol Company now operates an aircraft depot at Salisbury Plain and is developing "Farman Type" aeroplanes under supervision of British Military Authorities.

24 September 1910 : B. F. KEITH'S GRAND EDUCATIONAL DEMONSTRATION Presenting MR. CLAUDE GRAHAME-WHITE. The Famous English Aviator. Saturday, September 24th, 1910. Harvard Aviation Field. Atlantic, Mass. Issued with the Compliments of the Christian Science Monitor.

Claude Grahame-White was the Glamour Boy of early aviation. somewhat of a playboy, with no engineering background whatsoever, Grahame-White became enamoured of flying when, in 1908, he saw the Wright's demonstrate their invention to the French crowds at Camp d'Auvours. Within a relatively short time, self-taught, Grahame-White soloed his Blériot without a formal lesson. He quickly made a name for himself as a dashing aviator, when, in 1910, J. V. Martin of the Harvard Aeronautical Society, invited him to compete in the first Boston-Harvard Meet.

With the promise of a \$50,000 retainer & expenses, Grahame-White accepted and won that one (and others) as he thrilled spectators with his races & aerial exhibitions such as that announced in this "One-man Show" program.

This rare surviving play-bill lists the diverse aerial stunts to be performed by Grahame-White during the day with his Blériot Monoplane" and Farman Biplane - including a dive from 4000 feet "with engine stopped." 12 planned events included "Aerial switchback flying", "The corkscrew glide [spin?] from a high altitude." & "Knocking down ninepins placed on the ground, without alighting."

---

<sup>34</sup> [https://en.wikipedia.org/wiki/Cromwell\\_Dixon](https://en.wikipedia.org/wiki/Cromwell_Dixon)

With this sort of exhibition, and his dashing & flamboyant personality, the handsome Grahame-White gave the new aviation field, previously dominated by engineers, something that had been lacking to date, a 'sexy' nature.

15 - 30 September 1910 : The Bristol Company co-operates with the British War Office for "participating" in the 1910 Army manoeuvres<sup>35</sup>:

1. Captain Dickson - flying a Bristol
2. Mr. Robert Loraine - flying a Bristol equipped with a Wireless Transmitter [W/T] transmitting observations of the army to a portable station at Lark Hill - 1/4 mile distant.
3. Lieutenant L.D.L Gibbs - flying a clipped wing "Racing" Farman.

At the end of the Army manoeuvres:

1. Mr. Robert Loraine continues with the W/T experiments. Range of transmission is increased to over 1 mile.
2. Maj. Sir A Bannerman placed in command of the R.E "Balloon Section", Farnborough (vice Col Capper)
3. British War Office authorises the R.E to "enlarge the scope of the work at the Balloon School [...] by affording opportunities for Aero-planning"

01 October 1910 : Hendon, UK

Mr. Louis Bleriot:

1. Opens the Hendon aerodrome to the general public.
2. Builds 8 aeroplane storage sheds [hangars]
  - a) 3 sheds are leased to "The Aeronautical Syndicate Ltd." [produces the tail-less "Valkyrie" monoplane]
  - b) 5 sheds stocked with Bleriot monoplanes w/ Gnome engines for instruction and sale.

<sup>35</sup> Dallas Brett, "Bristol Co. & the War Office" - The History of British Aviation Vol. I - pg. 60 ; publisher - The Aviation Book Club, 32 Bloomsbury St. London WC1

## Notes on "Civil Aviation"

3. Hires Mr. Pierre Prier as "Chief Pilot Instructor". Mr Frank H. Butler [balloonist] is their 1st pupil.

October 1910 : Milan Aero Meet, Milan, Italy

October - November 1910 : Paris Salon, Paris France :

Voisin displays a new 2 seat "Pusher" biplane:

1. On this type Voisin has "abandoned" [deleted] the vertical side curtains from between the interplane struts.
2. Adopted "Ailerons" for control
3. mounted a mitrailleuse in the nacelle

1910 : Hugo Junkers patents "thick wing, all-metal type" aeroplane.

### 1910 : Germany : Patent request for an aeroplane mounted machine gun

Anthony Fokker files a patent application for a "Device that allows a fixed machine gun to be fired from an airplane".

1911 : Minister for the British Imperial Navy [Winston Churchill] argues *for the development of military aircraft*.

October 1910 : British Imperial Army "Central Flying School" opens.

October 1910 : Coandă-1910 - Romanian inventor Henri Coandă exhibits first aircraft powered by a "turbo-propulseur".  
at the International Aeronautic Salon, Paris France.

1910 : Owen McDowall of Owen Sound, Ont. visits France and England, Inspired to construct an airplane (completed 1915)

27 October 1910 : International Aviation Tournament at Belmont Park race track in Elmont, New York.

17 November 1910 : Ralph Greenley Johnstone - Wright exhibition team, first American pilot killed, Denver, Colorado after failing to recover from a dive.

10-16 December 1910 : Coandă reported as being test flown at Issy-les-Moulineaux near Paris.

18 December 1910 : Mr. Sopwith flies to Belgium.

T.O.M Sopwith takes off in his E.N.V powered Howard-Wright biplane from Eastchurch, circles to 1000 feet and heads for Dover. 30 minutes after taking off, he passes Dover and heads for France, crossing the French coast west of Cape Grisnez 22 minutes later. With an intended final destination of le Camp de Chalons, Mr. Sopwith intends to follow his compass, but it swings erratically and he disappears into the clouds [where he encounters turbulence which bounces him out of his seat and onto the wing]. Ultimately he crosses the Belgian border and finally lands at Thirrmont, 169 miles from Eastchurch on his 1st ever cross-country flight [having used 1/2 of his fuel supply] which wins him the 4,000 pound prize offered by Baron de Forest.<sup>36</sup>

22 December 1910 : Flight into FOG results in death of pilot.

Mr. Cecil Grace takes off in his Short-Farman from Swingate Downs and flies thru mist to Les Baraques, France. Wanting to get home to Dover thru the thickening mist -fog, Mr. Grace heads to the harbour where he meets with the captain of the steamship Pas de Calais to use the ships' smoke as a guide. The ship departs later than expected and Mr. Grace departs Les Baraques at the time he planned, but without his guide. The only trace ever found of Mr. Grace is his cap and goggles, which wash up on the beach at Mariakerke, Belgium 21 days later. Mr. grace becomes the 2nd British aviator killed in an aeroplane accident and the first pilot known to die by flying into fog.

28 December 1910 :

"Antoinette" monoplane collapses in midair over Issy-Les-Molineaux shortly after take off.

The French aviator Alexandre Laffont and Spanish passenger Mario Pola are killed in their attempt to fly to Belgium.

## Notes on "Civil Aviation"

1910 : British Admiralty : the 1910 edition of "The Steam Manual<sup>37</sup> for H.M Fleet" issued per Article 923<sup>38</sup> of the KR&O for the Royal Navy. Engineers of the Fleet are trained by the R.E and attached to ships of the R.N for the supervision of the ship and the ship's machinery. The instructions for the Engineers, identified by "Article" number are contained within the "Steam Manual" will subsequently also apply to the Engineers serving in the Royal Navy's "Air Service". The manual remains virtually unchanged at the outbreak of War in 1914.

Some of The Steam Manual Articles which may bear relevance upon Royal Navy Aviation Engineering :-

### Article 3 - Distribution of the Steam Manual to officers

#### 1. Each

- A. Commanding Officer on being first appointed to command,
- B. Engineer Officer and each Midshipman on first appointment, and
- C. each Engine Room Artificer and Mechanician on being rated as such,

is to be provided with a copy of the Steam Manual.

This copy is to be considered as the personal property of the Officer, Artificer or Mechanician to whom supplied, and is to be the only one supplied to him except when replaced by a revised edition or \when his copy has been worn out.

The supply of these Manuals to Engineer Officers, Engine Room Artificers and Mechanicians is to be made by the Engineer Rear-Admiral on the Staff of the Commander-in-Chief at the Home Ports. The books will be issued to him through the accounts of the Secretary to the Commander-in Chief, to whom he will furnish a receipt for the total number of Manuals received. Supply in lieu of a copy worn out may be made on the approval of the Senior Naval Officer.

**2. Engineer Officers are to insert in their copies on the pages provided for the purpose, such particulars of the Machinery, or other information connected with the ships to which they are attached as they may think will be of future service to themselves.**

### Article 4 Distribution of the Steam Manual to vessels

1. A copy of the Steam Manual is to be provided for every Steam Vessel in His Majesty's Navy, which is to be marked with the vessel's name. In the case of new ships it is to be issued to the ship on the first appointment of the Engineer Officer.

2. It is intended that the Ship's Manual shall contain such *particulars of the Engines* and Boilers, &c, as to *type, construction, age, makers, power, the dimensions of its more important parts, the results of trials and tests, particulars of any additions or alterations made, and its state and condition from time to time, so that, in the event of an Officer being appointed to a ship already in commission, he may be able, by its aid, to make himself acquainted with the nature of the Machinery placed in his charge.* The Engineer Officer is to arrange for the insertion of such particulars on the pages provided for the purpose.

3. The Ship's Manual is to be readily accessible to all the Engineer Officers who may be attached to the ship.

### Article 5 - Definition of the Term "Engineer Officer"

Throughout the Manual, unless there is something in the context or subject matter inconsistent therewith, the term "Engineer Officer" shall mean :-

- A. *the Officer, or*
- B. *the Senior Engine Room "Artificer" (Artisan-Officer, i.e the Trades' Foreman), in charge of the Machinery, whatever his rank or rating may be.*

### CIRCULARS.

#### Article 9.

A copy of all Circular Letters, Admiralty Weekly Orders, Store Memoranda, &c, which may be issued, relating to the duties of Engineer Officers, or which in any way affect the Engine Room Department, is to be inserted in a Guard Book, D 475b, and all Engineer Officers are to quote in their own copies of the Steam Manual the number, date and subject on the pages provided for that purpose.

#### Article 10.

---

<sup>37</sup> The Steam Manual for H.M Fleet, containing the "Regulations and Instructions" relating to the Machinery of H.M. Fleet, C.N 28766/10

<sup>38</sup> "Art. 923. In addition to the instructions contained herein all Officers are to be guided in the use and management of the Machinery and Boilers by the further regulations and instructions given in the ' Steam Manual,' which is furnished for their information and guidance so far as they may concern the Machinery and Boilers fitted to their ships."

## Notes on "Civil Aviation"

The Commanding Officer of every ship on commissioning will be supplied from the Commander-in-Chief's Office with a set of Admiralty circular letters, Admiralty Weekly Orders, Store Memoranda, &c, to the Fleet, and with the proper addenda and errata to the King's Regulations and other books of reference and instruction in accordance with the procedure indicated in Admiralty Weekly Order No. 89 of 18 February 1910.

### Article 11.

1. To facilitate reference, and to prevent the Circulars, &c. from being overlooked, notes should be made in the Manual, opposite the Articles that these are intended to modify or extend, calling attention to them.
2. If the Circular should not be intended as a modification or extension of any particular Article, but as an addition to the Instructions, a note referring to the Circular should be made at the end of the Manual.

### Article 12.

The Engineer Officers borne for staff duties at the Ports and in the various Fleets and Flotillas will ascertain that the Steam Manuals are in the possession of each of the Engineer Officers, Engine Room Artificers, and Mechanics, and that they, as well as the Ship's Manuals, are kept duly posted up in accordance with the directions for the same.

## DUTIES AND RESPONSIBILITIES OF THE ENGINEER OFFICERS OF H.M. SHIPS.

### Article 15.

1. The Engineer Officer is to have charge, and be responsible for the maintenance in a state of efficient working order, and, as far as may be, of readiness for immediate use, all that is placed under his charge, including :-

- (a) The main machinery and boilers of the ship.
- (b) The machinery and boilers of boats attached to the ship.
- (c) All auxiliary machinery and lifts, including motors, in the main machinery compartments, except as regards the electrical efficiency and repair of dynamos.
- (d) The following auxiliary machinery, however driven :-

Workshop engine and shafting.

All evaporating and distilling machinery.

All pumps, except lift pumps, and all pipes, cocks, and valves in connexion.

Hydraulic pumping engines up to the discharge valves on the pumps.

Hydraulic tanks.

Air-compressing machinery up to the discharge valve on the separator column.

Refrigerating, ice-making, and magazine cooling machinery.

All ventilating and forced-draught fans in connexion with the main machinery compartments.

All electric motors fitted for driving any of the above if situated in the engine or boiler rooms,

- (e) The following auxiliary machinery when not electrically driven :—

Electric generating machinery as far as the dynamo couplings.

Steering engines and gear as far as the rudder.

Capstan engines, shafting and spindles of capstans and windlasses.

Boat hoists and coal hoists.

Ventilating fans not in connexion with the main machinery compartments.

Any other steam, oil, or gas driven machinery and any other

hydraulic machinery except that detailed in clause 3.

- (f) All ventilating trunks, pipes and valves in connexion with the ventilating system.

- (g) All pipes, cocks, and valves in connexion with the pumping, draining, and flooding systems.

- (h) Temperley transporters, and all tools and apparatus on charge in store accounts and fixture list.

- (i) All watertight doors and their gear, whether vertical or horizontal, hinged or sliding ; armoured hatches with the Weston purchases or other lifting gear.

- (j) Instruments and gear, not electrical, for telegraphing signals in connexion with the machinery. Stoking indicators.

- (k) All double bottoms, wing spaces, coal bunkers, bilge compartments, bilges, and all spaces containing machinery which is solely or partly in his charge, as regards cleanliness and preservation. The Carpenter is, however, to be responsible as regards structural defects in these parts. (See Articles 331-353.)

- (l) All steel wire rope (other than derrick purchases) forming part of or directly in connexion with any machine placed in his charge.

- (m) Boilers of steam cookers.

- (n) Steam heating arrangements, with the pipes, cocks, and valves in connexion.

- (o) All spare gear, &c, of any of the above.

## Notes on "Civil Aviation"

2. All dynamos, torpedoes, submerged discharge tubes, and gear in connexion with them, and all electrically driven machinery, except that mentioned in clause 1, paragraphs a to d, and clause 3, with shafts, gearing, spare gear, &c, will be in charge of the Torpedo Lieutenant.
3. The gun mountings and all machinery for loading and working the guns, for supplying ammunition, and for turning turrets, barbettes, platforms, &c, together with the pipes, cocks, valves, and spare gear in connexion with them, except when steam, oil, or gas driven, will be in charge of the Gunnery Lieutenant.
4. In ships in which only one officer of the rank of Lieutenant is borne for Gunnery or Torpedo duties ; he is to be responsible for the whole of the Gunnery and Torpedo gear referred to at Clauses 2 and 3. When no Torpedo or Gunnery Lieutenant is borne, the Engineer Officer of the ship will be in charge of the machinery referred to.
5. Any mechanical repairs to machinery in charge of the Torpedo or Gunnery Officer, and beyond the capacity of their respective staffs, are to be taken in hand by the Engineer Officer. Similarly, any repairs to motors, &c, in charge of the Engineer Officer, and beyond the capacity of his staff, are to be taken in hand by the Torpedo Lieutenant.
6. In a Torpedo Boat Destroyer, or Torpedo Boat, the Engineer Officer is, in addition to the above, to have the responsible charge of the whole of the hull equipment.

### NEW MACHINERY AND MACHINERY OF SHIPS UNDERGOING EXTENSIVE REPAIRS.

#### ARTICLE 18.

1. Specification of New Machinery.—The Engineer Officer appointed to watch the construction of new machinery of any ship will be furnished with a copy of the specification. He is to call the attention of the Chief Engineer of the Dockyard (in case of Dockyard-built ships), or the Engineer Overseer (in case of Contract-built ships), ***to any instance in which he may be of opinion that its terms are not being complied with.***
2. A copy of the specification is also to be supplied to the Engineer Rear- Admiral on the staff of the Commander-in-Chief at the port to which the ship will be attached.

#### Article 19.

1. Weights of Machinery. D. 350.—The Chief Engineer of the Dockyard or the Engineer Overseer appointed to watch the machinery of a ship in process of construction, or the placing on board of new machinery, is to record in a book provided for that purpose the weights of the different parts of the machinery, classified in accordance with the instructions contained therein, noting also, as far as practicable, the material of which each part is constructed.
2. Record of Spare Gear.—He is to be particular in ***noting in the Book of Weights where each article of spare gear is stowed, for the purpose of facilitating any calculations which may be required in reference to the distribution of the weights in the ship.***
3. Book of Weights.—On the completion of the book, he is to forward a duplicate copy of it to the Engineer Rear-Admiral on the staff of the Commander-in-Chief at the port to which the ship is attached, for notation, who will forward it to the Engineer Officer of the ship to retain. The original is to be forwarded by the Engineer Overseer, or the Chief Engineer of the Dockyard, to the Controller of the Navy.
4. Stationery.—***Engineer Officers employed in watching the construction or fixing the engines, or in taking weights of machinery, are, on appointment,*** to forward a demand to the Admiralty on Form D. 2e, for the stationery estimated to be required to the 31st March or 30th September following. Subsequent supplies are to be demanded half-yearly on the 1st February and 1st August for the six months April to September and October to March respectively.

### NEW MACHINERY AND MACHINERY OF SHIPS

5. Engineer Overseers other than those referred to in the following clause, will be supplied by the Naval Store Officer, R.N. Store Depot, West India Docks, on demand, with such forms and envelopes on the Established List as may be considered necessary. Demands should be prepared on Form D. 397, in duplicate, and should be transmitted not oftener than once a quarter (1st January, 1st April, 1st July, 1st October).
6. Officers engaged at Contractors' Works in the vicinity of Portsmouth and Devonport are to draw their supplies of forms from those Yards, and demands should be transmitted to the Naval Store Officers on the dates specified in the previous clause.

#### Article 20.

1. Engineer Officer to be provided with tracings.—The Engineer Officer appointed to a ship receiving new machinery will be provided by the makers of machinery with tracings showing the details of engines, boilers, auxiliary machinery, general pipe arrangements, &c. If the vessel is fitted with water-tube boilers of the small tube type, he will be supplied with sketches showing the lettering and numbering of the tubes and a guard book for the Tube History Sheets.
2. Sketch Book. Explanations to accompany Sketches.—He will also be furnished with a book in which he is to make sketches (in ink, to scale and with dimensions) of such parts of the machinery, &c, of which tracings or prints are not supplied by the

## Notes on "Civil Aviation"

Contractors or Dockyard, especially of those parts which will be difficult of access when the machinery is complete and the ship ready for sea. The sketches should be as accurate and complete as possible, and should be accompanied by explanatory descriptions and remarks. Each sketch should be signed and dated by the officer who makes it.

3. Measurement Book. D. 280.—Measurement books will also be supplied to Engineer Officers to enable them to make the necessary rough sketches before drawing them to scale in the sketch-book.

### Article 21.

1. Information, &c, supplied by Shipbuilders.—Information and drawings respecting the watertight doors, the positions of the pumps and valves, the leads of the suction and delivery pipes, and the different compartments of the double bottoms will be supplied to the Engineer Officer by the Shipbuilders.

2. Information given before Ship is Commissioned.—The drawings of pipes, &c, will not be supplied until the work is actually completed, but in order that the Engineer Officers appointed to ships in course of construction may be as fully informed as possible, they will be allowed reasonable access to the working drawings of those parts of the structure and fittings of the ship that will come under their charge when the ship is in commission.

### Article 22.

1. To point out Alterations desirable.—The Engineer Officer of any ship building or undergoing repairs is to call the attention of the Chief Engineer of the Dockyard or Engineer Overseer (as the case may be) to any alterations or additions which he may be of opinion would be for the benefit of the Service, and to any instances in which he may consider that improper or insufficient fittings are being made in the ship.

When considered of sufficient importance, such representations are to be made in writing.

2. Suggestions before Work is too far Advanced.—Submissions of this nature should be made, if possible, before the work on the parts proposed to be altered has been taken in hand; but the submissions are not to be withheld even when the part proposed to be altered has been completed.

3. Notations in Sketch Book and Ship's Manual.—Should any changes be made in the machinery whilst a ship is undergoing repairs, explanatory sketches are to be inserted in the Sketch Book, and a notification of all such changes is to be made in the ship's Steam Manual. (See Arts. 4, 68.)

### Article 23.

1. **To inspect Machinery, &c, when joining Ship.**—An Engineer Officer appointed in charge of the machinery of a ship which is in charge of the Captain of the Dockyard is immediately after joining to make a careful inspection of all the machinery, boilers, parts of the ship, fittings, and stores under his care, and to report in writing to the Chief Engineer of the Dockyard and the Captain of the Dockyard the result of his examination.

2. **Responsibility.**—He will be responsible to the same extent as if the ship were in commission for the preservation in a state of efficiency of all that is placed under his charge, as laid down in Art. 15. Vide Art. 414.

3. **Custody of Fixtures and Sea Stores.**—He is to have the custody of, and be accountable for all fixtures, and stores on board which would be in his charge if the ship were placed in commission.

4. **Responsibility on raising Steam. To sleep on Board.**—He is responsible that on raising steam for any purpose all the precautions directed to be observed in raising steam for steam trials are strictly carried out, and on the night of the day on which the fires have been alight he is to sleep on board, provided the main engines have been worked, and sea connections opened, retaining with him a sufficient number of Engineer Officers, Engine-room artificers, and stokers to assist in case of fire or accident.

5. **Fire Regulations.**—He is to pay particular attention to the fire regulations and precautions, and is to be responsible for the prevention of danger from fire and lights in the engine-room department, and to allow no accumulation of clothes, oily wipings, or other matter liable to spontaneous ignition.

6. **To report Fire in Writing.**—He is, in any case where fire may occur, to report full particulars of the same in writing.

### Article 24.

1. Responsibility when in Hands of Dockyard or Contractors.—Should the machinery of the ship to which an Engineer Officer is appointed be in the hands of the Dockyard or of Contractors, *he is to keep a strict watch over all parts which would be in his charge were the ship in commission, in order to see that all necessary steps are taken for their preservation in proper condition. If in his opinion any part is liable to deteriorate from want of proper care or other cause, he is immediately to report the circumstance to the Chief Engineer of the Dockyard or Engineer Overseer (as the case may be) who will take such steps as the particular case may require, but he is not in any way to interfere with Dockyard or Contractors' workmen.*

2. **Idleness or Bad Workmanship.**—*He is to take steps to keep himself informed as to, and to report any cases of idleness, bad workmanship, or irregularity of conduct on the part of these men.*

## Notes on "Civil Aviation"

3. To watch Progress of Work.—*He is personally, or by his assistants, to watch the progress of the work (whether performed by the Dockyard or by Contractors) from its commencement in the morning to its cessation in the evening.*

4. *He is to keep an Engine Room Register in which a record is to be made of the progress of construction or repair of the machinery and boilers and of all examinations and tests of same.*

### UNDERGOING EXTENSIVE REPAIRS. 11

28.

1. Spare Gear. — The Engineer Officer is to satisfy himself that every article of spare gear has been properly fitted and tried in place.

2. Stowage of Spare Gear. — He will, when the machinery is being placed on board, at all times acquaint the Chief Engineer of the Dockyard or the Engineer Overseer (as the case may be), when the more important articles of spare gear are about to be stowed, so as to ensure their being, as far as practicable, secured in positions under protection from which they may be most readily brought into use if required, without disturbing other parts of the machinery or interfering with the structure of the ship.

3. Notation in Steam Manual. — Whenever it may be necessary to stow portions of the spare gear in places from which they cannot be brought into use without disturbing parts of the structure, the Engineer Officer is to make himself acquainted with the best methods of removing and replacing the same should occasion require ; particulars as to where stowed and method of removing or replacing to be inserted in the ship's Steam Manual.

Article 31.

1. Colours of Pipes. — *In order that the different pipes may be known by their colours, each pipe, or its casing, is always to be painted the colour that is shown for it on the authorised diagram.*

2. *The same colours will be used to show these pipes on the drawings which are supplied by the Dockyards for the information of the Officers.*

3. *Copies of the diagram will be supplied by the Dockyards, and are to be posted in convenient positions on board His Majesty's ships.*

### NEW MACHINERY AND MACHINERY OF SHIPS

33.

1. Examination of Under-water Fittings. — *In the case of a new ship built at a Dockyard, or of a ship undergoing extensive repairs there, the Dockyard Officers are, before the ship is launched or undocked, to ascertain by careful examination that all valves, gratings, pipes passing through the bottom, and other fittings below the waterline are well and properly constructed and fitted, in efficient working order and likely to remain so, and that all orifices through the ship's bottom are clear. If the Examining Officers have any doubts as to the durability of these fittings, new ones are to be substituted.*

2. The Examining Officers are to report the result of every such examination to the Principal Officer of their Department, and sign a certificate thereof, which will be kept in the office of the Chief Constructor.

3. In the case of a new ship built at Contractors' works, the above examination is to be carried out by the Hull and Engineer Overseers of the ship, in conjunction with the Contractors.

35.

1. To report Docking. M.S. — When a *ship in Dockyard hands* is placed in dock *the Engineer Officer is to report the fact to the Chief Engineer* of the Dockyard, *stating whether the machinery has been affected in any way by the process of docking.*

36.

## Notes on "Civil Aviation"

1. Examination of New Machinery. — As soon as the whole of the Contractor's trials in any ship, whether built by Dockyard or Contractors, are completed, *and the Officers, under whose supervision and observation such trials have taken place (see Art. 385), are satisfied that the requisite indicated horse-power has been developed, and that the machinery has otherwise worked satisfactorily and is completed, so far as the trials can shew,* according to the terms of contract, *the Contractors will at once prepare the whole of the machinery for examination, as detailed in the Machinery Specification, to enable the Examining Officers, acting on behalf of the Admiralty, to report on the state and condition of every part thereof externally and internally.*

2. Examining Officers. — The examination is to be made by the Engineer Rear-Admiral on the staff of the Commander-in-Chief at the port to which the ship will be attached or an officer deputed by him, and the Engineer Officer of the ship, assisted by the officers and men of the nucleus crew.

### UNDERGOING EXTENSIVE REPAIRS. 13

3. Arrangements for Examination. — *Should the machinery be too extensive to permit of the entire opening up at one time, the various parts are to be opened up as may be most convenient, and the Contractors will from time to time inform the Examining Officers what other portions are ready for examination, giving a day's notice in each case in order that they may be able to attend.*

4. Nature of the Examination. Specification to be read over.— The Examining Officers are to satisfy themselves :-

- A. that the machinery is in every part perfectly sound and in good condition ;
- B. that no fractures or flaws exist in any part whatever ;
- C. that the engines and boilers, with all their connections and accessories, are properly finished in accordance with the specification and the contract ; and
- D. that the machinery generally is in all respects fit and suitable for the Service.

Further, prior to the acceptance of the machinery, the specification is to be read over, article by article, in the presence of :-

- A. the Chief Engineer of the Dockyard or his representative, or of the Engineer Overseer (as the case may be),
- B. the Contractors' Agent,
- C. the Engineer Officer of the ship, and
- D. the Engineer Rear-Admiral, or an Officer deputed by him,

when all details, as to fittings, &c, are to be considered, to see whether they are in accordance with the specification.

5. If Machinery is defective. — If, on examination, any parts are found to be defective, or not in accordance with the contract, the Contractors are to be called upon to make all such defects good, and to leave everything complete to the satisfaction of the Examining Officers, and until this has been done the machinery is to remain in the hands of the Contractors, unless otherwise ordered.

6. Report to be made. — Anything found unsatisfactory is to be at once reported to the Superintendent for the information of the Controller of the Navy.

7. Report of Examination. — A report of the examination, signed by each of the Examining Officers, stating that the machinery and fittings are complete, fit for the Service, and in accordance with the terms of the contract is to be made to the Superintendent for transmission to the Controller of the Navy.

37.

Replacing of Parts after Examination. Completion Trial.- — As soon as the examination is completed, and the whole of the parts which have been opened up have been replaced by the Contractors under the personal observation and to the satisfaction of the Engineer Officer of the ship, a trial under-way is to be satisfactorily carried out to ensure that all adjustments are correctly made, all parts properly connected and joints tight. Any defects developed on this trial are to be made good by Contractors before acceptance.

38.

Examination after thorough Repair Trial. — After a thorough repair trial has been satisfactorily completed, whether subsequent to repair by Contractors or by the Dockyard, the procedure as laid down in Art. 36 is to be carried out, with the exception that only

## Notes on "Civil Aviation"

such parts of the machinery are to be opened up for examination as may be considered necessary by the Examining Officers to determine the efficiency of the repairs.

39.

1. Watch and Station Bill. — Before a new ship is commissioned a "Watch and Station Bill" for sea and harbour routine is to be prepared by the Engineer Officer, and approved by the Engineer Rear-Admiral on the staff of the Commander-in-Chief at the port ; this preparatory Station Bill serving *for the information and guidance of the Officers* when the ship is put in commission.

2. Book of Questions. D. 554. — The Engineer Officer is to insert the necessary answers in the Book of Questions for his department, and to deliver this book, and also the Engine Room Register directed to be kept by Art. 24, cl. 4, duly signed and completed, to the Engineer Rear-Admiral at least a week before the probable date of the ship's commissioning. These books will, after examination be returned to the ship for future reference.

### "CERTIFICATES OF ACQUAINTANCE" WITH THE STRUCTURE OF THE SHIP.

45.

1. Certificate of Acquaintance. Form S. 451. — Before a ship is commissioned for service in the Home Fleet with a nucleus crew the Engineer Officer, the Second Engineer Officer, and such other of the Engineer Officers as the Admiralty may direct, are to be examined touching their acquaintance with the details of the ship by the Engineer Rear-Admiral or Engineer Captain at the port to which the ship is attached. They must obtain certificates that they are conversant with the structure of the ship under the engines and boilers, the arrangement of the various valves and cocks, the working of the watertight doors, hatches, sluices, and pumps, the system of pumping, flooding, draining, and ventilating throughout the hull, and with the general construction of the ship.

Sketches at Examination. — Candidates are to produce at the examination sketches and drawings made by themselves of all the more important fittings, valves, sluices, doors, &c, in the preparation of which they are to be allowed access to the specifications and drawings of Contractors, and to such drawings in the offices of the Chief Constructor and Chief Engineer of the Dockyard as may be necessary.

2. H subsequently appointed, these Officers are to be examined by the Engineer Captain attached to the Fleet to which the ship belongs, or in fleets where no Engineer Captain is borne, by the Engineer Officer of the Flagship, and in the case of the 1st and 2nd Destroyer Flotillas of the Home Fleet, by the Engineer Commander of the Flotilla Depot ship. In these cases the examination should be applied for within three months of the Officer joining the ship.

3. Duplicate Certificate. — The Certificates are in all cases to be in duplicate, one copy being for the candidate and the other being retained by the Commander-in-Chief for local record.

### MACHINERY OF SHIPS IN COMMISSION.

51.

1. Engineer Officer on Appointment to examine Machinery. — When the Engineer Officer in charge of the machinery is relieved, his successor is, in conjunction with a competent Engineer Officer detailed for the purpose by the Commander-in-Chief or Senior Officer present, to examine the machinery, &c, specified in Art. 15, for the preservation and efficiency of which he is responsible either solely or partly with other officers.

2. Engineer Officer to assist with Examination. — Unless the exigencies of the Service will not permit, the Engineer Officer (Staff) is to survey the machinery in conjunction with the new Engineer Officer.

Should the exigencies of the service be such as to prevent the Engineer Officer (Staff), or where no such Officer is borne, the Engineer Officer of the Senior Officer's ship, from carrying out this duty, reasons for such departure are to be stated on the report (Form S. 354).

## Notes on "Civil Aviation"

3. Accuracy of Report. — This examination is to be carried out in such a manner that the results recorded on Form S. 354 can be accepted as an accurate statement of the actual conditions of the parts examined. All facilities consistent with the service on which the ship is employed should be afforded the Surveying Officers to ensure this.

4. Report of Examination. Form S. 354. — After the examination the Surveying Officers are to make a joint report on the Established Form (S. 354) to the Captain of the ship in triplicate, who will cause the triplicate to be attached to the Engine Room Register for the current quarter. The original and duplicate to be sent to the Commander-in-Chief for inspection, after which the original is to be forwarded to the Admiralty and the duplicate inserted in the Ship's Book.

5. Interim Report. — If the examination is not completed when the first Quarter's Engine Room Register is forwarded after the new Engineer Officer has taken charge of the machinery, and interim report, S. 354, is to be attached to that Register. In this report the parts which have been examined, with their state and condition, should be clearly indicated, together with a statement as to the probable date of the completion of the survey.

6. Examination deferred. — Should it be impracticable to make this examination when the Engineer Officer first joins his ship, the fact is to be reported by the Captain to the Admiralty, and the examination is to be carried out as soon afterwards as the exigencies of the Service will admit.

52.

1. Acquaintance with History of Machinery, &c. — The whole of the Engineer Officers are to use all possible diligence in making themselves thoroughly acquainted with the construction and condition of the machinery and boilers, with the nature and extent of the repairs (if any) that they have undergone, and the date of the more recent, and with such other facts as may be necessary to afford thorough knowledge of their history and capabilities.

2. Acquaintance with Watertight Doors, Valves, &c. — They must also make themselves thoroughly acquainted with the positions of and methods of working the watertight doors, and also with the positions and uses of all pumps, valves, and pipes, in connection with the bilges, and with the different compartments of the double bottoms when the ship is so constructed, so that in case of necessity there shall be nothing to prevent their immediate use.

3. Drawings to be Accessible. — All official drawings, as well as those contained in the sketch book, are always to be accessible to the Engineer Officers of the ship (Art. 20).

53.

Engineer Officer to furnish Reports. — The Engineer Officer is, through his Captain, to furnish the Engineer Rear-Admiral, Engineer Captain, or the Chief

### 16 MACHINERY OF SHIPS IN COMMISSION.

Engineer of the Dockyard with such written reports or returns as they may require relative to the state of the machinery and boilers in his charge ; and whenever these Officers visit the ship he is to afford them every facility, and all the information in his power, to enable them to carry out the duties entrusted to them.

54.

## Notes on "Civil Aviation"

1. Quarterly Inspection of Machinery. — The Engineer Captain or Engineer Commander borne for staff duties in each Fleet Squadron or Flotilla is to inspect the machinery and boilers of the ships of such Fleet or Squadron quarterly, or oftener if necessary, and is to inform the Commander-in-Chief of the result. On these inspections he is to examine the Engine-room Registers, Ship's Steam Manual, and Engineer's Store Accounts, and to report any neglect he may discover in properly recording all the information required to be inserted in the Register and Steam Manual, and any undue or excessive expenditure of stores. The date of his inspection is to be noted on the first page of the register, and signed by him.

2. Machinery of Harbour Ships in Commission. — The machinery of all ships in commission belonging to the home ports and not attached to a fleet is to be inspected once in each year by the Engineer Rear-Admiral or Engineer Captain on the staff of the Commander-in-Chief of the port. The reports are to be made on the Established Form, and forwarded as directed in Art. 51, cl. 4.

55.

1. Orders tending to Injure Machinery. E.R. Register. — Whenever any order is received which, if executed, would in the opinion of the Engineer Officer tend to injure the machinery or boilers, or cause a useless expenditure of power, he is to make a representation to this effect to the Captain, but, unless the order is countermanded after his representation, he is to execute it. Whenever this occurs, the Captain will cause the orders received and the representation made to be noted in the Engine-room Register.

2. Representations of Engineer Officer. E.R. Register. — Whenever the Engineer Officer may, in the course of his duty, make any representations or suggestions to the Captain with reference to the repairs or preservation of the machinery or boilers which the Captain either thinks unnecessary, or, if necessary, which the exigencies of the Service do not admit of being carried out immediately or at an early date, he will direct the Engineer Officer to note the particulars in the Engine-room Register.

62.

Time available for making good Defects. — On each occasion of completing a voyage the Commander Officer should ascertain from the Commander-in-Chief or Senior or Naval Officer, the time available for examining and making good defects of machinery, and acquaint the Engineer Officer so that the latter may make the necessary arrangements for completing the work, if possible, by the time the ship is next required, or for proceeding with it in such a manner as to enable him to undertake that which is the most urgent and important, whilst keeping the vessel ready for service within a given number of days' notice

63.

Weekly Return of Work. S. 163. — In all ships, except Torpedo Boat Destroyers and Torpedo Boats, weekly returns on printed forms are to be rendered to the Captain by the Engineer Officer, showing : —

(a) The number of Artificers and Mechanics borne.

(b) The number of hours they have worked during the week at their respective trades,

B 2

20 MACHINERY OF SHIPS IN COMMISSION.

- (c) A summary of the work on which they have been engaged,
- (d) Defects completed and new defects developed.

65.

When necessary to put into Port on account of Defects. — When the Engineer Officer considers it absolutely necessary to put into port on account of defects in the machinery or boilers, he is to make a written report to that effect to his Captain, stating the reasons that render such a step necessary, instead of making the requisite repairs at sea ; this report will be appended to the list of defects for the information of the Senior Officer of the port at which the ships arrives, who will transmit these documents, with any remarks he may have to offer thereon, to the Commander-in-Chief, or Senior Officer of the Station or Squadron, by whom, in special cases, they will be forwarded to the Secretary of the Admiralty.

66.

1. Defects of machinery. — When making out a list of defects, any which can be undertaken by the ship's artificers are not to be included. It is to be carefully discriminated between the items of repairs absolutely required for " seagoing and fighting efficiency" which are to be forwarded on Form S. 340, D. 275, and those desirable for other reasons which are to be forwarded on Form S. 340 B., D. 275 B. In order to avoid duplication of labour in dealing with lists of defects in H.M. ships, the Pink Lists (Form S. 340) should contain all items of work which, in the opinion of the respective Commanding Officers, cannot be deferred without loss of efficiency.

2. Parts to be included. — This list to include all such defects in any of the parts specified in Art. 15.

3. Defects and Supplementary Defect Lists. When to be forwarded.— The list of defects is to be prepared in a complete and intelligible manner, so that the requirements of the ship may be clearly understood, and a speedy decision given as to proceeding with the work.

The defect list is to be forwarded to the Dockyard to which the ship is assigned for the purposes of repair, so as to arrive there one month before the date fixed for the arrival of the ship.

In the case of any fittings requiring special preparation, all necessary details are to be sent with the defect list, and accurate and fully dimensioned sketches with templates, gauges or patterns of any parts requiring renewal should accompany the lists.

When forwarding lists of defects for which Dockyard assistance is required, a manuscript list is to be attached to the original, and duplicate copies of the lists of defects, stating in detail what further items of repairs, examinations, and other work not included on Forms S. 340 and S. 340n, are proposed to be carried out by the ship's staff during the time the vessel will be in Dockyard hands. These lists are to accompany Forms S. 340 and S. 340b, for the information of the Dockyard

## Notes on "Civil Aviation"

Officers and of the Admiralty.

Should any defects develop which cannot be undertaken by the ship's staff subsequent to the transmission of the main lists, a supplementary list is to be sent immediately after the arrival of the ship at her port.

4. When ships in commission come into the Dockyard hands to have defects made good, only such defects as have been represented by the Officers of the ship, or have been apparent to the Examining Officers, or become apparent during the opening up necessary to make good known defects, and which may be approved to be taken in hand, will be made good. No special examination will be made in search of further defects.

5. The following items of work should generally be dealt with by ship's Artificers : —

Work to be done by Ships' Artificers. — Adjustments of main and auxiliary engines. Examination of machinery and boilers. Re-seating small and medium size valves. Re-making ordinary steam and water-pipe joints. Packing glands and repairs to pipe lagging. Cleaning boilers. Renewals of protective slabs in boilers, condensers, &c. Minor repairs to furnace brickwork. Renewals of boilers. Examination and refit of underwater fittings, boiler mountings, cylinder fittings, &c. Tests of boilers, condensers, and pipes, by water pressure. Small renewals of condenser tubes, tightening ferrules, &c. Overhaul and ordinary repairs of steam-boats' machinery and the smaller auxiliary engines.

6. Form S. 134 D. — Any materials required for making good defects by the ship's artificers, which cannot be met out of the ship's stores, will be supplied from the Dockyards, a demand being made on Form S. 134 D., and a brief statement as to the nature of the defect to be made good given in the space at the foot of the Form. Such defects are not to be included in the lists forwarded on Forms S. 340, D. 275, and S. 340 B., D. 275 B.

7. In those fleets, squadrons, and flotillas of which the ordinary means of effecting repairs are supplemented by a repair ship ; as soon as defects are discovered the assistance of the repair ship is to be fully utilised in reduction of those defects which cannot be made good entirely by the ship's artificers, and for which some Dockyard assistance would otherwise be required. As much of such defects as can be conveniently done by the ship's staff are not to be undertaken by the repair ship.

67.

1. Engineer Officer to watch Progress of Work. — Whenever the ship comes into the hands of the Dockyard to have defects made good in the Engine-room department, the Engineer Officer is personally, or by his assistants, to watch the progress of such repairs, and he will be held responsible for all risks of fire arising from the presence of Dockyard workmen in his department. He is not, however, to interfere with such workmen, but he is to report to his Captain if he observes any idleness or bad workmanship on their part, or any other irregularity.

2. E.R. Register. — Full information respecting the nature of the defects and repairs should be given in the Engine-room Register with references in the Quarterly Abstract at the end of the Register.

3. Whenever the machinery and boilers of any of H.M. ships are under repair by a Dockyard or by Contractors, the Engineer Officer of the ship is to watch carefully the progress of the work in hand, and give all the assistance in his power.

## Notes on "Civil Aviation"

4. He is to consider it a part of his duty to bring to the notice of the Engineer Rear-Admiral, or Engineer Captain, anything that has been done, or omitted to be done, which would in his opinion impair the efficiency of the machinery or boilers.

5. If during the progress of the repair the Dockyard Officers or Contractors do not consider it desirable to carry out any proposal the Engineer Officer may put forward, he is to bring the circumstances of the case to the notice of the Captain of the ship, as, on the completion of the repair, he (the Engineer Officer) will be held responsible for having satisfied himself that the machinery and boilers are in all respects in good working order.

68.

1. Alterations and Additions. — Any alterations and additions in ships which experience suggests as being desirable are, in the case of a new ship, to be reported by letter through the respective Commanders-in-Chief to the Admiralty six months after the date of first commissioning. In all other ships any proposed alterations and additions are to be submitted annually, and at the same time as the lists of defects. (See Art. 66.)

2. Care is to be taken in ships that have completed one or more commissions that the lists of such proposed alterations and additions are confined to items necessary for sea-going and fighting efficiency.

3. In forwarding proposals for alterations and additions it should be stated whether it is proposed that the work involved shall be carried out by the ship's Artificers, and in such cases a demand on Form S. 134 D. for such materials as are required should be prepared and forwarded to the Dockyard, a note being placed on such demands that the materials are for effecting an alteration or addition submitted to the Admiralty, and will be required immediately Admiralty approval has been given for carrying out the work.

It is to be distinctly understood that no alteration or addition is to be taken in hand without Admiralty approval.

4. Lists of any outstanding alterations and additions which have been approved, but not yet carried out, are to be forwarded to the Dockyard at the same time as the defect list, so as to arrive there one month before the date fixed for the arrival of the ship.

5. Should any change be made in the machinery while the ship is in commission or undergoing repairs, explanatory sketches are to be inserted in the sketch book, and a notification of such changes is to be made in the ship's manual. (See Arts. 4, 20, 22.)

71.

1. The Engineer Officer is responsible at all times for the good order and cleanliness of the Engine-room department.

2. Station Bill. — He is to prepare a Station Bill showing clearly the stations and duties of each Officer and man under his control, which, after being approved by the Captain, is to be hung up in some conspicuous position in the Engine-room. (See Art. 39.)

In the disposal of the officers and men, he is to consider what are the best

arrangements possible for meeting the requirements of the ship, both before and during an action, as far as they can be anticipated. Vide Arts. 89 ; 134 ; 512, cl. 5 ; 517 and 519.

3. Allotment of Work. — He should allot the work of his department in such a manner as will best ensure its being efficiently performed by the Officers and others composing his staff, and so that each may know definitely for what he is personally responsible.

4. Watch-keeping in Engine-room. — All Engineer Officers in commissioned ships with the exception of the Engineer Officer in charge of the machinery are to be employed in watch-keeping in the Engine-room when steaming under way, except under exceptional circumstances. Officers employed on particular duties, as in the case of the Second Engineer Officer, and those employed in assisting the Engineer Officer with his clerical work, should keep at least four hours' watch per day, to ensure the watches being placed to as great an extent as possible in charge of Officers.

72.

1. Engineer Officer to visit Department. — The Engineer Officer is to visit the Engine-room department repeatedly during the day, and at any time, either by day or night, when his presence may be rendered necessary by any accident or other cause. He is always to be in the Engine-room when going into or out of harbour, or through any intricate channel, or when performing any evolution when more than ordinary care is requisite in executing with promptitude the orders given from the deck.

2. Department to be Inspected. — When not under steam the whole of the Engine-room department is to be inspected every evening by one of the Engineer Officers, who must satisfy himself that all the cocks and valves are shut or otherwise as ordered ; that there are no signs of fire, nor anything lying about that may ignite by spontaneous combustion, and there is no probability of an accident occurring in any part of the Engine-room department during the night. (See also Art. 541 et seq.)

A watch is to be kept in any stokehold in which fires have been alight, for 12 hours after the fires have been drawn or have burnt out.

73.

1. Training of Midshipmen. — The Engineer Officer will be responsible that the necessary arrangements are made for the training of the Midshipmen attached to the Engine-room Department.

2. It is primarily intended that their instruction should be effected by actual experience of the work carried on, and that they should in this manner become acquainted with the methods and practice adopted in harbour for the care and maintenance of the machinery, and acquire the necessary knowledge and experience under way to enable them, by the time they go up for examination for Sub-Lieutenant, to perform the duties of Engineer Officer of the Watch.

They should see such repair work as is going on in any part of the Department and take part in examinations of hull and machinery, advantage being taken of any opportunities that present themselves of seeing engineering operations in the Dockyards.

## Notes on "Civil Aviation"

3. They should make themselves sufficiently acquainted with the accounts kept of the receipt and expenditure of stores, and with the Engine-room Register and Defect List, to obtain an insight into the business management of the Department.

4. Each Midshipman is to keep an Engineering Note Book in which he is to insert descriptions and detailed sketches of parts of the main and auxiliary machinery, and particulars of important repairs, with the reasons necessitating them. This book is to be periodically signed and dated by the Engineer Officer, and is to be examined and valued at the preliminary examination in Engine-room duties.

74.

1. Staff conversant with their Duties.— The Engineer Officer is to take such steps as may be necessary to ensure that the Engineer Officers and all Engine-room ratings belonging to the ship are fully acquainted with their several duties, and he will at all times encourage them to perform those duties with promptitude and to the best of their abilities. He is responsible that the machinery and boilers are taken due care of, and that all examinations are conducted carefully at the specified times, and as necessary.

Engineer Sub-Lieutenants with little experience should, as far as practicable, be trained for a time in the duties of watch-keeping under Senior Officers.

2. Inexperienced Officers. — Should there be in the Engine-room Staff an Officer who is inexperienced, or who cannot be considered thoroughly competent, such Officer is not to be entrusted with the examination or repair of any important part of the machinery, or with the performance of any of the important duties of the department, except under the supervision of the Engineer Officer himself, or of an experienced Officer on whom the Engineer Officer can rely, and the Engineer Officer is to take every opportunity to instruct any such Officers in their several duties, and to use his best endeavours to make them competent.

75.

Engineer Officer to instruct Artificers. — The Engineer Officer is to instruct the Junior Engine-room Artificers in their duties, and to make such arrangements as may be necessary to enable them to become qualified, as soon as possible, to keep watch in the Engine-room or Boiler-room.

76.

1. Training of Stokers. — The Engineer Officer is to give particular attention to the training of the stokers, especially as regards the management of the fires, and to cause the Officers under him to take advantage of every opportunity for instructing the stokers how to burn the coal in the most economical manner.

79.

1. Spare Gear. — The Engineer Officer is to satisfy himself that the spare gear belonging to his department is in good condition.

2. Preservation of Spare Gear. — Such bright parts of the spare gear as are not readily accessible or are liable to get rubbed or knocked, are to be protected by being painted, or, if necessary, covered with tallowed spun yarn or other suitable material ; other parts may be bright and oiled or tallowed.

3. Examination of Spare Gear. E.R. Register. — Bright parts of the spare gear

## Notes on "Civil Aviation"

which have been painted or otherwise protected are to be cleaned for examination at least once a year. After examination they are to be made bright and again protected as before, and notes are to be made at the end of the Engine-room Register to show what parts of the spare gear have been examined, in what condition they were found, and the way in which they have been again protected from injury.

4. Spare Gear left on Shore. — Should any article of spare gear be left behind when the ship goes to sea, the Engineer Officer is to report the same to the Captain, in order that it may be reported to the Admiralty for the information of the Controller of the Navy. A notation of the circumstances is to be made on the fixture list.

5. Articles removed from the Ship. E.R. Register. — If any articles of spare gear are removed from or deposited out of the ship, the authority for the removal, the place of deposit, and the officer in whose care they remain, are to be stated in the Engine-room Register on the day of the removal, and also at the end of each Engine-room Register, until they are brought back again to the ship. On change of Home Port or Station any articles of spare gear so deposited are to be dealt with as provided by Arts. 1061 and 1788 of the King's Regulations and Admiralty Instructions.

6. Transfer of Vessel. — Whenever a vessel is transferred from one port to another or in the case of torpedo-boat destroyers, torpedo-boats, or steamboats from one ship to another, the whole of the spare gear is to accompany the vessel, with a proper list for verification.

7. List of Spare Gear. — Each vessel will be furnished by the Dockyard Officers with a complete list of spare gear belonging to it in store at the Dockyard, a separate list of machinery, &c, appropriated to classes of vessels being furnished to each vessel for which suitable. In the case of vessels attached to a flotilla, copies of such lists will also be furnished to the Base Ship.

80.

1. Care of Tools. — The Engineer Officer is to exercise constant supervision to see that the machines, tools, and other fittings supplied for the Engineers' workshop are kept in good order and thoroughly efficient.

2. Expenditure of Stores. — He is to have charge of all Engineers' stores. He is to keep the accounts of receipt, expenditure, and remains, to be responsible for the due care of them, and that they are only used for purposes for which they were issued, and to render the accounts at the stated times. (See Arts. 566 et seq.)

3. Yeomen of Stores. — A Yeoman of Stores, who will assist in the issue of the Engineers' stores and tools, will be allowed in all ships of 3500 I.H.P. N.D. and above, except Torpedo Boat Destroyers.

Report as to Fitness. — On the Engineer Officer of the ship being superseded, or on a man holding the rating of Yeoman of Stores leaving a ship, a report is to be attached to the man's certificate as to his fitness or otherwise to be employed again in that capacity. Similarly, a report is to be attached to his certificate if it is found necessary to remove him from the duty for any reason.

82.

1. Control of Engine-room Ratings. — When the ship is under steam the Officer

of the Watch in the Engine-room department, whether an Engineer Officer or a Chief Petty Officer, is to have the immediate control of the Engine-room ratings on watch, and is to exercise a general superintendence over the machinery, shafting and boilers. He will be held responsible for the efficient management and working of the whole of the machinery and boilers in use during the period of his watch.

83.

Engineer Officer of the Watch. Duties of. — The Officer of the watch in the Engine-room department is to attend very particularly to the expenditure of coal, oil, and other stores, and to see that they are not wasted ; to record in the Engine-room Register, at the specified intervals, all the information required therein relative to the working of the engines, &c. ; and he is, during the period of his watch, to be responsible for the good order of the Engine-room department and for all the duties connected therewith.

84.

1. Duties on Watch. — Should an accident of any kind occur to the machinery of a ship when under steam, or should the Officer of the watch in the Engine-room department observe, or be informed there is anything going wrong with the engines or boilers, he is immediately to make the Engineer Officer acquainted with it, and, at the same time, take such steps as he may consider necessary for the safety of the machinery.

86.

Signatures in Register. — The Engineer Officers of the watches are to certify by their initials the correctness of the particulars inserted in the Register for the time they were on watch, and each day's proceedings are to be verified by the signature of the Engineer Officer.

Instructions relative to the entries to be made in, and the method of keeping the Engine-room Register are given in the first three pages of the Register.

87.

1. Charge in W.T. Compartment.— The Officer, Chief Petty Officer, or Petty Officer in charge of the machinery in each watertight compartment is directly responsible for the efficient working and proper management of the whole of the machinery and boilers in that compartment when no Senior Officer or Petty Officer is present. Should an accident of any kind occur, or should he observe anything which he thinks is likely to cause injury to the machinery or boilers, he is immediately to acquaint the Engineer Officer of the watch, and his responsibility only ceases with the presence of a Senior Officer.

91.

1. Economical Working at Reduced Speeds. Comparison of Results. — To ensure the economical working of modern machinery, especially at reduced speeds, Engineer Officers are enjoined to study the matter in relation to the particular engines in their charge, and to compare recorded results of their performances at different powers, noting especially the rate of consumption per I H.P. over sufficiently extended periods to ensure fairly reliable results.

2. The subject of economical steaming at all powers is to be considered as of the greatest importance ; and every means that are supplied for this purpose are to be used to attain this end.

## Notes on "Civil Aviation"

3. Officers are to be guided in the care and management of turbine machinery by the Memorandum of Instructions for Turbine Machinery.

92.

1. Rate of Expansion. — The engines fitted in H.M. vessels are designed to carry out the principle of expansion to its utmost practical limits, and the valve gear of reciprocating engines should be set so as to give the degree of expansion found to produce the most economical results for the speed required. If the engines are in proper condition the use of a high rate of expansion should not affect their smooth working. The limiting rate of expansion will generally be found to have been reached when loops have been formed by the compression curve in the indicator diagram.

2. Adjustable Links. — The adjustable links fitted are intended for the regulation of the ratio of the work done in the several cylinders. The practice of obtaining equal powers in the cylinders is to be considered of only secondary importance, and the adjustable links should be set to give the most economical results for the speed required as found by trial, provided the differences in the powers developed are not excessive and do not interfere with the smooth working of the engines.

5. Economy. — Although it is of great importance to obtain the maximum economy, it should always be borne in mind that the proper preservation of the machinery is of the first importance.

100.

Turbine Clearances — It is essential for the safe working of turbine engines that the clearances at the dummy turbines should not be reduced below, and for economical working that they should not be increased above, the designed amounts. These clearances and the wear on the turbine bearings are to be frequently checked.

101.

Turbine Expansion Couplings. — Frequent examinations are to be made of the expansion couplings fitted in the shafting connecting the main and cruising turbines in order to ensure that the parts are well lubricated, and that an efficient sliding coupling is maintained.

102.

1. Turbines, Drainage of. — When under way care is to be taken that all turbine engines not in use and steam pipes connected with them are thoroughly drained.

2. Turbine Machinery ; Working and Management of. — Further detailed instructions for guidance in the care, management, and working of turbine machinery of the Parson's Marine type are contained in enclosure to A.L., C.N. 35341-1909, of 6th December 1909.

103.

Injury to Machinery. — Every precaution is to be taken to prevent injury to the machinery, particularly when in motion, from anything falling on it.

104.

Lubrication. — Mineral oil only is to be used for the lubrication of all parts of

the main and auxiliary engines which come in contact with steam or feed water, and, with steam pressures of 155 lbs. and over, heavy filtered mineral oil is to be used exclusively for this purpose.

x 1579 r .

105.

4. Before closing up the machinery for raising steam, any mineral oil that has collected in the internal parts should as far as possible be removed, and the working surfaces cleaned.

107.

3. Attention to Lubricating System. — When under way constant attention should be paid to the lubricating system, and the temperature of the oil as it drains from the bearings should be frequently examined.

4. Examination of Oil in System. — When oil has settled in the drain tanks, settling tanks, or crank chambers, a quantity should be drawn from the bottom for examination and any oil which has become deteriorated should be removed and filtered and used for open auxiliary engines, &c. The strainers should be frequently examined and cleaned. The oil wells beneath the bearings also act as settling tanks and should be cleaned out periodically.

111.

Chocks and Ties. E.R. Register. — All chocks and ties fitted to cylinders, boilers, and other parts of machinery, to prevent them from shifting from the effects of collision, are at all times to be kept in efficient condition ; they are to be examined once in each quarter, and their condition noted in the Engine-room Register. (See Art. 219.)

Examination of Machinery. — After a vessel has steamed about 20,000 miles, the following examinations, adjustments, &c, of the machinery should be carried out in a thorough manner : —

Cylinders.- — Ascertain the condition of the walls and gauge the diameter, both in the athwartship and fore and aft directions at the middle and ends of each cylinder ; the tightness of the cylinder jackets should also be tested if it is considered necessary, and the liner bolts examined.

Pistons. — Gauge wear on metallic rings, and see that all the springs are efficient ; adjust the restraining edges of restrained rings as necessary to keep them efficient ; also note the clearances at the ends of the stroke.

Piston rods. — Test the rods for straightness and parallelism, see that the nuts are tight, that the metallic packing is in good condition, ascertain that the crosshead pins are parallel with the crank shaft, and adjust the guides as necessary.

Slide valves. — Gauge wear of liners and spring rings of all piston valves, and see that they are efficient ; adjust restrained rings if fitted ; examine the faces of the flat valves, and adjust the relief arrangements ; care should be taken not to screw up the packing, if so fitted, more than necessary to keep the rings at the back steam-tight, and to keep the valves in position ; particular care is necessary when india-rubber packing is used, owing to its

## Notes on "Civil Aviation"

liability to swell under the action of mineral oil. Check the positions of all the valves, and compare with the original settings.

Slide valve rods. — Examine nuts and check nuts by which the valves are secured to the rods ; see that the rods are parallel and the metallic packing is efficient ; and adjust the guides as necessary.

Connecting rods. — See that these rods are in line with the piston rods ; adjust brasses as necessary, keeping in view the clearance of the pistons. Particular care is required with vertical engines to prevent the crank-pin brasses from becoming slack, as any " hammering" on the centres will tend to split the pistons.

Crank and propelling shafting. Thrust Bearings. — Remove all bearing caps and examine journals ; test the conditions of alignment, making such gauges or templates as will enable this to be done with facility ; rectify any tendency to imperfect alignment which the machinery may develop in working, as imperfect alignment is a frequent cause of heated bearings ; the alignment of the crank shafts should be tested both when the engines are cold and also when under the temperature of working condition ; examine condition of thrust bearings, and see that the crank shafts are not forced forward ; see that all coupling bolts are in good condition.

The outboard portions of the propeller shafting to be examined as provided for in Arts. 242 et seq.

Eccentrics, straps, and rods. — See that the eccentrics remain an accurate fit on the shafts, and that the keys are in good condition ; gauge their diameters to ascertain if they are worn oval, and rectify any inaccuracy ; adjust the straps and rods, keeping in view the setting of the slide valves.

Link motions.- — All the pins, bushes, brasses, &c, to be examined and adjusted as necessary.

Air-pumps. — All the valves and guards to be carefully examined and renewed where necessary ; see also that the plunger packing is efficient. The clearances at the end of the stroke are also to be ascertained and corrected as necessary.

Condensers. — The condition of the tubes, and ferrules, and the tightness of the tube ends in the tube plates to be ascertained and defects remedied. (See Art. 116 et seq.)

Holding-down bolts and other fastenings, &c, to be examined to ascertain whether they are secure and efficient,

Auxiliary engines, &c. — Such auxiliary engines as could not be overhauled while the vessel was under way, and all other parts of the machinery, are to be well examined and all defects made good, so that as far as possible the engines shall be in a state of thorough efficiency.

2. Occasional Examinations. — In the cases in which vessels do not make lengthened runs, the examinations above mentioned are to be carried out as opportunities offer, but the whole of the parts enumerated should be thoroughly examined during a period of 12 months. The Engineer Officer must determine for himself, knowing the general condition of the machinery, the order in which such examination should be made, and also whether it may be necessary to examine any portion more frequently.

3. Pistons of Horizontal Engines. — The wearing down of the pistons in horizontal engines is to be carefully watched, and they are to be lined up to the central position when required ; the packing rings are also to be turned some distance round as they become worn.

4. E.R. Register. — Each of these examinations, with full information concerning the state of the parts examined, and the adjustment or repair carried out, is to be noted in the Engine-room Register.

5. While machinery is opened out for examination or repair and when closing up, every necessary precaution is to be taken to prevent anything lodging, falling into, or remaining inside or upon any part of the main and auxiliary machinery ; which would be likely to lead to obstruction or injury when the machinery is in motion. A responsible officer is on all occasions to satisfy himself that the machinery is entirely free from tools, starting screws, loose bolts and nuts, dirt, or any other obstruction before the several parts of the machinery are closed up.

120.

1. Indicators. — The Engineer Officer is to see that the Indicators are kept in an efficient state, so that, in addition to being able to ascertain the power the engines are developing, he may at any time, by means of an Indicator diagram, be able to form an opinion of the working of the internal parts of the engines.

122.

Auxiliary Machinery. E.R. Register.— The auxiliary machinery is to be examined frequently, and all examinations and repairs are to be noted in the Engine-room Register, and auxiliary engines not in use are to be turned by hand daily.

123.

Telegraphs. E.R. Register. — The condition of the instruments fitted on board for telegraphing signals in connection with the machinery is to be noted at the end of every week in the Engine-room Register.

124.

1. Steering Engines, Telegraphs, &c. Examination. E.R. Register. — The Steam Steering Engine, and its controlling gear, and all telegraphs and their shafting, including the Helm Signal Gear from the rudder head to the drum or wheel which receives the wire halyards, are to be examined personally once a week by the Engineer Officer, or competent subordinate detailed by him, and the result of this examination is to be recorded in the Engine-room Register. On all occasions before getting under way a further examination is to be made, and the Engineer Officer is to satisfy himself by personal inspection, and by actually working the steering gear and telegraphs, that these fittings are free from obstruction and in good working order, care being taken that the instructions issued with telemotor controlling gear are strictly observed. A report to this effect is to be made by the Engineer Officer to the Commanding Officer at the same time that the main engines are reported ready.

2. Inspection of Rudder. — Whenever the rudder is required to be worked by

## Notes on "Civil Aviation"

steam, the Engineer Officer is to satisfy himself, by personal inspection, or by the report of a competent subordinate detailed by him to make the inspection, that the rudder is unlocked, and the locking bolts stowed in the place provided for them when not in use, before the controlling gear of the Steering Engine is connected and steam is admitted to the engine.

3. Care when Steering Gear has been Disconnected. — Whenever the Steering Gear has been disconnected from the Steering Engine, special care is to be taken before vessels get under way, during the examination and working referred to in clause 1, to ensure that the gear and engines are properly connected, so that when the helm is placed hard over both ways the gear is well clear of the stops. For this purpose the rudder, after connection to the engine, is first to be worked by the engine before the deck gear is connected, and should be put over gradually both ways to intermediate angles, and the angles of the rudder compared in each case with the angles recorded on the indicator at the engine, to ensure that the readings agree. When the deck control gear is connected a similar procedure is to be followed.

135.

1. Internal Combustion Engines, Naked Lights, Precautions with Motor Boats. — The instructions issued by the makers of the various types of internal combustion engines are to be generally followed in their care and management.

2. When opening out the internal combustion engines, electric lamps, the connections of which are in good order and not liable to sparking, should be used if possible. No naked light is to be brought in the vicinity of the vaporisers or crank chambers until all inflammable gas has been expelled.

3. The inflammable vapour which may be formed, being heavier than air, its dispersion from tanks and closed spaces by ordinary means of ventilation is very difficult. The use of bellows or windsails will assist in expelling the vapour. In motor boats especial care is necessary.

4. The ignition circuit throughout must be carefully insulated and the electric leads properly supported. External sparking is, as far as possible, to be guarded against.

5. Fuel Tanks. — Fuel tanks and all fuel pipes and connections are to be regularly examined, and their freedom from leaks ascertained.

6. Matches. — Matches or lamps are on no account to be brought in the vicinity of the fuel tanks, or lockers.

7. Cans for containing inflammable oil, whether empty or not, must be securely closed and stowed in the locker provided. When not required to be open, the locker is to be properly closed, and is not to be used for any other purpose.

8. If fire extinguishers are supplied for motor boats they are always to be carried in the boat, and the crew instructed in their use.

9. Motor Boats, hoisting in. — The supply of oil fuel to the motor is to be shut off before the boat is hoisted in board.

138.

1. Cylinder Temperatures overheating. — The temperatures of the lubricating oil and the circulating water discharge should be frequently taken during the

## Notes on "Civil Aviation"

running of the engines. The rise of temperature of the circulating water discharge should not exceed that obtained during the trials of the engines.

2. Cylinder Jackets and Covers. — The cylinder jackets and covers are to be examined regularly, and any deposits from the circulating water removed from the surfaces.

3. In the event of the cylinders overheating internally or the circulating water having an unusual temperature, the jacketed surfaces in contact with the cooling water should be cleaned at the earliest opportunity.

140.

1. Pistons and Valves. — The pistons and valves of internal combustion engines are to be kept clean and in good condition, in order that the work of the engines, may not be impaired by leakage during compression.

2. Diagrams ; Diesel Engines. — Indicator diagrams are to be occasionally taken from internal combustion engines to ensure that they are working correctly.

3. In ships fitted with Diesel engines, the blast pressure should be maintained as low as possible consistent with obtaining the necessary power from the engine.

4. The firing in the cylinders of internal combustion engines should be observed regularly to ascertain that the oil fuel injected is correctly burnt and does not accumulate. This is particularly important in engines of the Diesel type, and can be tested by opening the indicator cocks.

152.

1. Draining of Boilers. — When any ship is fitted with new boilers, or the boilers are thoroughly repaired in a Dockyard at home or abroad, the Dockyard Officers will furnish the Engineer Officer of such ship with a drawing showing the construction of the boilers, the nature of the material, and the original and present thicknesses of the plates and stays ; and with a copy of the report of examination and drill or other tests made to ascertain the wear and waste at such time of repair, and with any other information which may be of value in connection with the boilers.

2. A copy of the report by the Dockyard Officers giving the results of their examination of the boilers, with drill or other tests, if any have been made, is to be placed in the Captain's ship's book, to which the Engineer Officer should be at liberty to refer.

344.

6. When Ship has been Strained. — If any ship has been strained, or it is believed that water has been lodging in any part of her, or there is any reason to think that the hull is defective, a thorough survey of the places likely to be affected is to be made, whether the periodical survey is due or not.

362.

1. Notice of Trials to Admiralty. D. 550. — Whenever the date of a Contractor's Commissioning, Thorough Repair, Special measured mile, Paying off or, Turning trial is fixed, application for approval is to be made to the Commander-in-Chief, or Superintendent (according to the class of trial) on Form D. 550, and notice is to be sent to the Admiralty in sufficient time for an Officer to attend the trial

should it be deemed necessary.

2. Contractors' and Measured Mile Trials should be carried out as near the load draught and trim of the vessel as practicable, unless otherwise directed.

363.

1. Responsibility for Management of Machinery, &c- — In general, the persons to be placed in charge of the engines and boilers of ships during steam trials are those who have previously had them under their care and control. Specific instructions are given in reference thereto under each class of trial. When the ship is in commission, the machinery during any trial is to be under the charge of the Engineer Officer of the ship.

2. Vigilance. — All Officers concerned in the steam trials of ships and in the management of their machinery are to exercise the strictest personal attention and vigilance to ensure that everything is maintained in proper working order.

3. The Engineer Officer of the ship should always be present during steam trials.

383.

Conditions of Trial. — Contractors' trials are to be carried out in accordance with the conditions relating to trials as defined in the machinery specifications, and subject to the general instructions for steam trials.

385.

1. Officers to Watch Proceedings of Contractors. — The Officers appointed to attend the trials are carefully to watch the proceedings of the Contractors and of their agents, and to see that nothing is done, or omitted, which (either by act or omission) would endanger the safety of the ship or the lives of those on board. (See Art. 364.)

2. The trials will be run under the supervision of the Engineer Rear-Admiral or his representative on the staff of the Commander-in-Chief of the port to which the ship is attached who will be responsible for the reports. (Arts. 372, 373.) The responsibility for the acceptance of a new Torpedo Boat Destroyer will rest with the Officer appointed to command and the representative of the Engineer Rear-Admiral at the Port.

3. A representative of the Chief Engineer of the Dockyard (in the case of Dockyard built ships), or the Engineer Overseer (in the case of Contract built ships), will attend the trials.

THOROUGH REPAIR TRIAL.

401.

When to be made. — This trial is to be made before a ship in the charge of the Admiral Superintendent of a Dockyard is commissioned, whenever the machinery has undergone a thorough repair, whether by the Dockyard or by contract, and it is to be carried out as soon as the repairs are completed, the preliminary trials have taken place, and the persons responsible for the efficiency of the repairs are satisfied that the engines and boilers are in all respects ready for a full-power trial.

THOROUGH REPAIR TRIAL

402.

Object of Trial. — The object of this trial is to ascertain whether the repairs have been efficiently performed, and if the engines and boilers are in all respects ready for service, and whether the indicated horse-power is obtained with any undue loss of efficiency. For this purpose the engines are to be linked up, and the cylinder jackets used sufficiently to obtain a satisfactory comparison with the results recorded on the original trials of the ship.

403.

1. Officers in Charge. — When the ship has been repaired at a Dockyard, the Chief Engineer of the Dockyard is to have charge of the engines and boilers during the trial.

2. When the ship has been repaired by contract, the Contractors or their agents are to be in charge. The Chief Engineer of the Dockyard or his representative, and the Engineer Officer of the ship, are to watch the trial to see if the repairs have been executed in a satisfactory manner.

3. The Engineer Rear-Admiral on the staff of the Commander-in-Chief of the port to which the ship is attached or his representative, is to attend the trial, whether the ship is repaired by contract or by Dockyard, and will be responsible for the reports (Art. 372, 373).

407.

1. Trial after Repairs at Foreign Yard. — Whenever a ship in commission is tried under way after repair at a foreign Yard, the machinery, is to remain under the charge of the Engineer Officer of the ship.

2. The Chief Engineer of the Yard, or his deputy, with as many Dockyard workmen as he may consider necessary, will attend the trial to watch whether the repairs have been effected satisfactorily.

514.

1. Safety Lamps.— No naked light, is to be used inside the coal-bunkers, or within 20 feet of any opening into the Bunkers, until it has been ascertained by means of a safety lamp, that they do not contain explosive gas, and special precautions in this respect are to be taken for a few days after coaling. In any case in which the distance of 20 feet is impracticable the distance maintained should be as great as possible.

2. The Engineer Officer is to satisfy himself personally that all Petty Officers and men of his department are specially instructed in the precautions necessary in these cases ; and in considering candidates for advancement, their knowledge of this subject is to be ascertained by examination, and noted on their passing certificates. (See also Article 351.)

525.

## Notes on "Civil Aviation"

Internal Combustion Engines. — Flash Point. — The oil supplied for internal combustion engines fitted in H.M. ships and ship's boats has a flash point of not less than 200° F. No oil of lower flash point is to be used in connection with these engines. Mineral Colza is to be used where necessary for cleaning valve spindles, &c.

### PRECAUTIONS AGAINST FIRE.

541.

1. Appliances for Extinguishing Fire. — The Engineer Officer is to pay special attention to all the appliances under his charge for extinguishing fire, and frequently to examine them personally to see that they are in a state of thorough efficiency and ready for use at a moment's notice.

547.

1. Spontaneous Ignition of Cotton Waste, &c. — Cotton waste which has been used as wipings for oil is very liable to become ignited through the heat developed by the rapid oxidation of the oil ; and it has been demonstrated by experiment that this action is not confined to drying oils, such as boiled and raw linseed, rape, &c. All the oils, except mineral, must, therefore, be considered as more or less liable to cause the spontaneous ignition of cotton waste and similar fibrous or other porous materials.

2. Greasy Wipings to be Destroyed. — Cotton waste, and other wipings saturated with oil or grease, are to be destroyed immediately after use.

548.

1. Iron Bins. — All lockers and bins, in which wipings or other combustible materials are deposited, are to be constructed of iron, in order to guard as much as possible against accident from fire.

2. Storage of Oil, Tallow, Cotton Waste, &c. — Oil, tallow, and cotton waste and other wipings are to be kept in the iron tanks supplied for the purpose, which should be placed as far from the boilers or steam pipes as convenience will permit.

### CLERICAL DUTIES.

561.

Clerical Duties. — The Engineer Officer is responsible for the correct fulfilment of the clerical duties of his department.

562.

1. Quarterly Report in E.R. Register. — The Quarterly Report of the state of the machinery at the end of the Engine-room Register is to contain all the information required in the form ; and as it is most desirable that specific information should be given of the probable time during which the efficient working of the machinery and boilers may be depended on without having recourse to a shore establishment for repairs, the word " uncertain " is on no account to be used with regard to such particulars, but the closest approximation is to be made that his knowledge will admit of. If the time be dependent on accidental circumstances, such explanation should be added as may enable the Professional Officers of the Admiralty to draw their own conclusions.

## Notes on "Civil Aviation"

2. Examinations and Defects. E.R. Register. — The dates of all examinations are to be given at the end of the Register ; and any special defect in the machinery is to be particularly noted in the spaces provided for recording defects.

563.

1. Transmission of Registers. — When the ship is under steam, the fair register is to be sent to the Captain as soon as possible after noon each day ; and at the end of every quarter it is to be forwarded to the Commander-in-Chief or Senior Officer of the Station or Squadron, for examination and transmission to the Admiralty.

2. Register not to be closed. — When a ship is paid off to be re-commissioned at once, the Register is not to be closed but transferred to the new Engineer Officer, who will continue it to the end of the current quarter and forward it as directed.

3. Rough Engine-room Register. — A rough Engine-room Register is to be kept in the- engine-room, and the necessary observations recorded in it as they are taken. In all ships having two engine-rooms separated by a watertight bulkhead two rough Engine-room Registers are to be kept when under way, one in each engine-room. One of these is to be kept by the Engineer Officer of the watch, and is to contain all the necessary particulars of the working of the engines and boilers, and the second by the watchkeeper in the other engine-room, and is to contain a record of all the required particulars that take place in that engine-room.

These Registers are to be used in compiling the fair and duplicate copies of the \* Engine-room Register, and are to be kept in the ship for a period of about three months after the date of the last entry made in them, or for any longer period if the Captain considers it necessary. For further instructions relative to the method of keeping the Engine-room Register, and the entries to be made therein, see the first three pages of the Register.

In the event of a collision with any vessel, other than one of His Majesty's Ships, the rough Engine-room Register is to be preserved until it has been ascertained that no legal proceedings will take place with respect to such collision, or until after the completion of the proceedings.

4. Duplicate Register. — The duplicate Register is to be an exact copy of the fair Register, all the information contained in the latter being inserted in the former, with the exception of the specimen sets of diagrams. The particulars of the diagrams attached to the page provided in the fair Register are to be inserted on the corresponding page in the duplicate Register.

5. Duplicate Registers to be kept. — When a ship is paid off the duplicate Engine-room Register for the commission are to be retained on board and preserved for reference during the subsequent commission.

6. The duplicate Engine-room Registers for the last commission need only be retained on board during the next commission, those for previous commissions being destroyed.

### STORES, AND STORE ACCOUNTS

569.

2. Information to be furnished by Engineer Officers. — The Engineer Officer is, in the first instance, to furnish to the Home Yard at which the ship is to be stored an estimate of the probable requirements for 12 months in cases where the allowance

is not defined or the expenditure will be irregular. If after sufficient experience it appears desirable to revise this estimate, a communication should be made on the subject to the Naval Store Officer of the Yard from which supplies are drawn. The Naval Store Officer should also be informed of any special stores subsequently introduced for use in the ship of which a 6 or ] 2 months' reserve stock should be maintained.

PARTICULARS OF MACHINERY.

575.

Particulars of the engines, boilers, and other machinery as are necessary to give a fair knowledge of their construction, age, repairs, &c, are to be noted by the Engineer Officer, under the various headings, at the end of the Manual in the Appendix.

(a) Engines. — Particulars as are required under the various headings, the horsepower, number of revolutions, &c, obtained on the contractor's trials, and on the several trials referred to in Arts. 425 et seq., any peculiarities in the construction of the engines, and any method of working that has been found most beneficial. If the engines be compound or triple expansion engines, the most efficient grades of expansion in the different cylinders for the various powers should be noted ; also the most effective pressures in the steam jackets.

(b) Boilers.— Particulars as are required under the various headings : positions of auxiliary cocks, valves, and pipes ; peculiarities of construction of fittings ; dates and nature of repairs ; best method of treatment of boilers, &c. If any sign of corrosive action has been discovered it should be noted, with the part of the boiler in which found, and the nature of the action. If the boilers have been drilled, or otherwise tested for wear and waste, the thickness of the plates, &c, at the different parts at that time should be noted.

(c) Propeller. — Particulars as are required under the various headings, and whether the pitch is uniform or increasing. The different tests of the screw, in order to determine whether or not the shaft is bound, should be noted in these pages, with dates of the test

(d) Miscellaneous. — Particulars of the different auxiliary engines in the ship ; motors in the main machinery compartments ; positions of the watertight doors ; flooding and other sea-cocks and valves ; Downton or electric bilge pumps ; leads of the suction pipes ; compartments of the double bottom, with the positions of the cocks and valves for filling and emptying them and such other information relative to these fittings as maybe necessary to give a fair knowledge of their position and uses. The compartments fitted to carry oil fuel and a reserve supply of fresh water for boiler purposes and the amounts they contain.

(e) Any other information. about the engines, boilers, or other machinery which is considered important should be noted in these pages, so that, if there be any change of the Engineer Officer, the Officer taking charge may be able to get such a preliminary knowledge of the machinery that the survey may be facilitated and be more complete.

### CANADIAN AVIATION - 1911

January 1911 : The "Alexander Prize"

British Advisory Committee for Aeronautics report for 1910 issued. The report includes the results of the the "Alexander Prize" competition which stipulated that a British designed and British built aero-engine must produce a minimum of 35 hp for the duration of a 24 hour test. The engine which comes closest to winning the prize is the 60hp 219 pound 4 cylinder inline Green engine which developed an average 31.5 Bhp for 24 hours = 6.925 lbs/hp. The competing Wolseley and the Humber engines were unable to run the full duration.

January 1911 : The Royal Aero Club awards (the 1st and 2nd) Dirigible pilots' certificates to Capt. P.W.L Broke-Smith and Lt. C.M Waterlow

January 1911 : The Royal Balloon Factory is now home to 4 aeroplanes:

1. A Bleriot mono-plane
2. A Wright bi-plane
3. A bi-plane owned by Geoffrey deHavilland.
4. A new Henry Farman bi-plane, which is soon destroyed at Laffan's plain while being flown by Capt. Burke

10 February 1911 : Mr. Leo Walsh demonstrates his "imported" Howard-Wright for the Prime Minister of New Zealand at Papakura.

27-28 February 1911 : World's 1st "Air Mail"

A Humber bi-plane [with a Humber engine] carrying 5,000 letters is flown from the exhibition grounds at Allahabad, India to Naini by Capt. W.G. Wyndham and Mr. Pequet. The Indian Post Office cancels each letter with a special stamp "1st aerial post, U.P Exhibition, Allahabad, 1911"

1911 : United Kingdom : Col. Seely is Under-Secretary for War

01 March 1911 : The "Naval Contingent, R.E" commences training at Eastchurch.

The 1st "6 months" course of instruction [for members of the R.E detached to the Royal Navy] commences on Short's built aircraft owned by Mr. Frank McLean. The men are instructed by Mr. G.B. Cockburn.

1. Lieut. R. Gregory, R.N
2. Lieut. C.R Samson, R.N
3. Lieut. A.M Longmore, R.N
4. Lieut. G.V.W Lushington, Royal marine Artillery
5. Lieut. Gerrard, R.M.L.I, R.N

10 -12 March 1911 : A British manufactured Bristol Biplane powered with a Gnome engine is flown in Singapore by Mr. Christiaens of Belgium.

11 March 1911 : The "Olympia Aero Show"

Mr. Maurice Farman debuts his "enclosed nacelle", Renault engined, pusher bi-plane. The nacelle encloses the pilot and passenger and the aero-plane has a bi-plane tail with an "elevator" carried on an outrigger in the front of the craft. This is the first time a "Longhorn" Farman is seen, and it will become the principle training machine of the RFC until 1916.

2nd week of March 1911 : Letters marked "First Aerial post, U.P Exhibition, Allahabad, 1911" begin to arrive in England.

01 April 1911 - Henley Regatta, UK : Graham-Gilmour, the well known English aviator of the Royal Aero Club of England flies over the regatta course at Henley, during the boat races with five aviators from Hendon. This results in his suspension by the club and the chief of the london police meeting with the home secretary [Winston S. Churchill] re the danger aeroplanes present to the British Public, when flown recklessly. Douglas Graham Gilmour, Aviator Engineer born 7th. March 1885, French Aero Club pilot's licence no. 75 at Pau on 29 March 1910 His many feats included: flying over Hampton Court at a height of 200 feet contravened royal parks regulations by descending without permission among a herd of deer near Hampton Court.; flying up the Thames to Henley Regatta with his landing-wheels touching the water; dive-bombing both the Oxford and Cambridge crews during the University Boat Race until he ran out of fuel and was forced to make an emergency landing on a nearby cricket field - Two days before he had flown up the Thames at Westminster.

## Notes on "Civil Aviation"

The Club put him on trial, in the first "air court" ever held in England. The Court suspended his flying certificate for a month on account of his escapade at Henley, but decided that public safety was not endangered by his Westminster flight.; and, allegedly, flying beneath Tower Bridge in a biplane. The Royal Aero Club suspended his certificate, but this did not deter him, and he continued to fly until his untimely death killed in an aeroplane accident at Richmond, 17th. February 1912, Effects £22. collected a batch of police court summonses for speeding and driving a motor car to the danger of the public. On his first appearance at Woking the chairman of the magistrates imposed a nominal fine, but was so impressed with the charm of the young aviator that he invited him home for tea. He had amassed ten convictions, including three for dangerous driving, by March 1911, was fined again, and had his licence suspended for three months. On this occasion he had been driving rather fast from Brooklands to Brighton, keeping up with his fellow aviator Oscar Morison who was making the first ever cross-country flight to Brighton. the first aviator to fly to Portsmouth, over-fly Royal Navy warships, and demonstrate their vulnerability to air attack. He 'bombed' Fort Blockhouse, the submarine depot's headquarters, with oranges, before landing in the grounds of the Haslar Royal Naval Hospital. Accused of manslaughter in one traffic accident, Gilmour was summoned to Wiltshire assizes at the end of May 1911. News spread of his intention to fly to court and thousands of Salisburyans were on the look-out for his aircraft. He flew from Shoreham to Salisbury, circling the cathedral spire several times en route for the assizes. Although exonerated at the inquest he was later sent for trial following disclosure of driving while disqualified; he was acquitted. At Henley regatta, while racing was in progress, Gilmour flew with his wheels almost touching the water. On 7 July he followed the Thames, flying past the houses of parliament and round St Paul's Cathedral. These 'stunts' brought him into conflict with the Royal Aero Club, which had already cautioned him over the Salisbury Cathedral flight. The club suspended his pilot's licence, but since it was a French one a Court of Appeal judgment ruled against them. On 17 February 1912, in perfect flying weather, after taking off from Brooklands for a cross-country flight in the Martin-Handasyde, Gilmour's plane crashed in the Old Deer Park, Richmond. Suddenly the machine began to wobble. A moment later one, or both, wings buckled up. The airplane dived from a height of 300ft., and the nose buried itself a foot deep in the ground. Graham Gilmour was killed instantly and he died of a fractured skull, aged twenty-seven. Gilmour anticipated the possibility of dying in an air accident and in April 1911 had lodged a letter with a friend setting out his wishes, especially requesting no bell be tolled. He was buried on the 21st at Mickleham church beside his parents. He donated his Blériot to Clifton College and it was fixed to rafters in the gym. Although so well known for his enthusiasm and feats of daring flying, he was a most careful pilot, always using a safety belt. His obituary in *Flight* recorded 'he was one of those pilots whom the science and practice of heavier-than-air locomotion could little afford to lose' 39. His Brother Stanley Graham Gilmour also obtained his aviators Cert in 15.12.1914, and served in WW1—Lieut RFC—survived

01 April 1911 : 1st day of the financial year. Royal Engineer's balloon school, Farnborough is reformed as the Air Battalion. From now until 13 May 1912 ALL Army Flying is by the Officers of the R.E. The "Air Battalion" now consists of:

1. Headquarters, based at Larkhill, Salisbury Plain
2. Company No.1
3. Company No. 2

The staff of the "Air Battalion" of the R.E at Farnborough consist of:

1. One Commanding officer - Maj. Sir Alexander Bannerman, R.E
2. 13 "Other officers":
  1. Capt. Broke-Smith, R.E - Dirigible pilot
  2. Capt. J.B Fulton, R.F.A
  3. Capt. Burke, Royal Irish Regt.
  4. Capt. Maitland, Essex Regt.
  5. Capt. Carden, R.E
  6. Lieut. R.T Snowden-Smith, A.S.C
  7. Lieut. Theodore Ridge, Assistant Superintendant - Balloon Factory
  8. Lieut. R.A Cammell (R.Ae.C certificate issued 31 Dec. 1910)
3. 23 N.C.O's:
4. 153 men of the R.E :
5. 2 Buglers:

The equipment of the "Air Battalion" of the R.E consist of:

1. 4 riding horses
2. 32 draught horses
3. 5 "experimental" aeroplanes:
  1. Blériot - mono-plane

20 April 1911 : Canada Gazette :

Public Notice is given under 1st Part of Chapter 79 of the “Revised Statutes of Canada, 1906” known as “The Companies Act”:

Letters patent have been issued under the seal of the Secretary of State for Canada incorporating:

1. Georges Azaire Binet, manufacturer,
2. Napoleon Dion, accountant,
3. Ernest Charrette, hotel-keeper, and
4. Arthur Binet, assistant customs officer -

all of the City of Fraserville in the Province of Quebec, for the following purposes:

Item (J): To conclude agreements with:

1. the Dominion of Government, and
2. the Provincial Governments of Quebec, New Brunswick and Nova Scotia, and
3. with any person whatever,

to aid in making experiments and undertakings for the purpose of establishing and promoting in Canada:

1. the oyster industry,
2. **the aerial navigation**, and
3. signal stations;<sup>40</sup>

1911 : Joy-Riding Restrictions

As a result of the increase in dangerous antics by un-certified aero-plane pilots, the RAeC takes steps to protect the Public from Danger. The RAeC enacts that “Any aviator who carries passengers without having first obtained an “Aviator’s Certificate” should have the subsequent granting of said certificate postponed until the RAeC committee deems the aviator competent.

23 May - 20 June 1911 : The Imperial Conference met at the Foreign Office in London, UK.

Present at the meeting :

1. The Chairman: The Right Honourable L. Harcourt, M.P., Secretary of State for the Colonies
2. For Canada :
  1. The Right Honourable Sir Wilfred Laurier, G.C.M.G., Prime Minister of the Dominion.
  2. The Honourable L.P. Brodeur, K.C., Minister of Marine and Fisheries.
3. For Australia :
  1. The Honourable A. Fisher, Prime Minister of the Commonwealth.
  2. The Honourable E.L. Batchelor, Minister of External Affairs.
4. For New Zealand:
  1. The Right Honourable Sir Joseph G. Ward, K.C.M.G., Prime Minister.
  2. The Honourable J. G. Findlay, K.C., LL.D., Attorney- General and Colonial Secretary.
5. For Union of South Africa :
  1. General the Right Honourable L. BOTHA, Prime Minister of the Union.
  2. The Honourable Sir D.P. de Villiers-Graaf, Bart., Minister of Public Works, Posts and Telegraphs.
  3. The Honourable F. S. Malan, Minister of Education.
6. For Newfoundland :
  1. The Honourable Sir E.P. Morris, K.C., Prime Minister.
  2. The Honourable R. Watson, Colonial Secretary.

Sir W. L. - “I would view with serious apprehension the interference of any body whatever between the Home Government and the Governments of the Dominions. Sir W. L. adhered to the position he took up four years ago, that *the relations between the*

---

<sup>40</sup> Chapter 79 - revised statutes of Canada - as amended by order in Council of the 9th February, 1897 - instituted an act respecting the navigation of Canadian waters.

## Notes on "Civil Aviation"

*Dominions and the Mother Country should be carried on by themselves.* The organization of the Colonial Office had given ample satisfaction, and Sir W. L thought they should leave matters as they were at present.

25 May 1911 : 3rd fatality of a British pilot.

Mr. B.G. Benson, a student pilot at the "Valkyrie School"- Hendon, is killed during his 1st gliding attempt from 200 feet when he stalls his machine vertically into the ground from 40 feet.

25 May 1911 : Imperial Council, 2nd Day :

Sir Joseph Ward <sup>41</sup> :

1. Does the Conference fully appreciate what has happened so quietly, because the relations between the Motherland and Canada have been so harmonious ?
2. Canada has, in recent years, grown into a strong nation, no longer in a state of tutelage, sheltering behind the protection of the Motherland.
3. Canada, feeling that she has passed through infancy to full manhood as a nation, has originated and made law a naval "scheme" (Programme) for the creation and maintenance of a local navy, a navy not only to be maintained and controlled by the Canadian Government, but a navy which is not to participate in an Imperial war unless Canada herself approves of that war.
4. Under the existing system, the rest of the Empire, consequently, might be at war, and the Canadian Navy withheld from it, and inactive. But I want to impress the fact that the Empire cannot be at war and Canada at peace at the same time.
5. Any war to which the statesmen of the United Kingdom commit the Empire involves Canada, as well as New Zealand, and all other portions of the Empire, and from the point of view of international law Canada is as much a part of the Empire as England.

27 May 1911 : 4th fatality of a British pilot.

Mr. Vladimir Smith is killed in St. Petersburg, Russia, by flying into the ground when he fails to pull his "Sommer" bi-plane out of a dive or steep turn.

June 1911 : Paris, France - The French War Minister is killed in an aeroplane accident.

June 1911 : With the recent death of the French War Minister, "the exploits of Grahame Gilmour and others over a boat race course" are recalled and the RAeC summons Mr. Gilmour and Mr. Melly before the committee for questioning. Gilmour a re: his flying over Salisbury and landing nearby and Mr. Melly re his alleged flying over Liverpool.

June 1911 : As a result of a meeting with the London Police Commissioner over his concern for the safety of the Coronation the Home Secretary [Winston Churchill] introduces a BILL into parliament "to prevent flying of air-craft" over the route of the Coronation procession of King George V. The Bill which is to become the "Aeronautics Act, 1911" passes thru both houses and receives Royal assent in 7 days. [breaking all records for getting legislation passed].

The new Aeronautics Act applies to the entirety of "The British Empire", including by extension, her Dominions, Territories and possessions around the world.

01 August 1911 : Mr. Gerald Napier is killed while flying his Bristol bi-plane at Brooklands.

Flying with a passenger for the 1st time, he attempts a spiral descent and is caught by a gust of wind. The aircraft side-slips into the ground and Napier is killed by the engine. His passenger is thrown clear and narrowly escapes death.

18 August 1911 : Lieut. Theodore Ridge is killed at Farnborough while attempting to fly an experimental "deHavilland" against the advice of its' designer. Lieut. Ridge stalls the aircraft in a

<sup>41</sup> Minutes of Proceedings of the Imperial Conference 25 May 1911 - Imperial Council, 2nd Day : Sir JOSEPH WArD pg 47. <https://archive.org/details/1911minutesofprooimpeuoft>

## Notes on “Civil Aviation”

gliding turn and it dove into the ground.

09 September 1911 : In a repeat of his Indian Air Mail, Capt. W.G. Wyndham [who returned to England in February] with the aid of Mr. Lewis Poole promote an “Experimental Air Mail service” from Hendon to Windsor. The Post Office assumed “No Liability” and the care of the letters is placed in the hands of the staff-pilots of the Bleriot and Grahame-White schools at Hendon. The 1st “UK Aerial Post” letters are subsequently carried by aeroplane from London to Westminster for the first time by Mr. Gustav Hamel in a Bleriot at an average speed of just over 105 mph.<sup>42</sup>

17 September 1911 : Death of Lieut. R.A Cammell, Royal Army

Detailed to take delivery of the 1st Valkyrie mono-plane for the British War Office, Lieut. Cammel, arrived at Hendon to accept the aircraft and fly it to Farnborough. Lieut. Cammel does not familiarise himself with the controls but instead takes off and begins to fly the aircraft like he flew his Bleriot [stunting recklessly] as soon as he was airborne. He then stops the engine and vol-planes in a gliding turn during which he overbanks and sideslips into the ground. The Lieut. is thrown from the wreckage [not belted in] and lands on his head, killing him instantly.

rough Statistics compiled by Automobil-Welt to the end of October 1911				
Nation	Pilot Certificates issued to date	Pilots killed in flying accidents	%	Notes
France	500	27	5.4	Numerous types flown
Germany	135			Numerous types flown
Great Britain	110	9	8.2	Numerous types flown
Russia	55			Numerous types flown
Italy	45			Numerous types flown
United States	35	12	34.3	Most Americans are flying “Wright” aircraft. 8 fatalities on Wrights. Most die during “Stunting” exhibitions which attract crowds
Total	880	48	5.5	

November 1911 : The “Future Development” of Aerial Navigation in Britain is considered.

A sub-committee of the Committee of Imperial Defence, under the chairmanship of Viscount Lord Haldane, was instructed by the English Prime Minister to:

- I. consider the future development of aerial navigation for naval and military purposes.
- II. consider the measures required to secure an efficient aerial service.

December 1911 : The Royal Navy’s “School of Flying” is established at Eastchurch

1911 and 1912 : Belgian pilot Mestach flies an “Antoinette” monoplane on exhibition flights over Quebec City QC, Sherbrooke QC and Winnipeg MB.

18 December 1911 : UK Technical Sub-Committee of Imperial Defense is formed by Lord Haldane to *examine the possibility of creating an aviation service*.

The Royal Army’s “Air Battalion” is created as a result of their recommendations. ??

CANADIAN AVIATION - 1912

THE EDINBURGH REVIEW or CRITICAL JOURNAL

"The Judge is condemned when the guilty is acquitted" - Publius Syrus

: JANUARY, 1912 ... . APRIL, 1912 LONGMANS, GREEN, AND CO.  
39 Paternoster Row, London, April 17, 1912.

VOL. CCXV. NO. CCCCXXXIX. 1912

JANUARY 1912. No. 439.

In the last year of the eighteenth century a German Romantic, whose frail body was the servant of a mind endowed with insight beyond the common, wrote these words :

The practical man wholly rejects bare theory, without suspecting how problematic must be the answer to the questions :

1. whether Theory exists for the sake of Application?, or
2. whether Application exists for the sake of Theory?

It is thus that Novahs voices a thought ever present, though in different forms, to those whose task it is to-day to train and prepare our army for war.

It is just this fact which differentiates the British army of 1912 from that of the past, even the recent past, for it is not so long since the practical British soldier rejected bare theory ; war to him was all application.

That generation, the direct heirs in tail of former generations of British soldiers, has passed away, leaving the destinies of the army in the hands of the men who sat at the feet of Henderson, and learnt from that inspiring teacher that ' Li all ages the power of intellect has asserted itself in war.

It was not courage and experience only that made Hannibal, Alexander, and Caesar the greatest names of antiquity. Napoleon, Wellington, and the Archduke Charles were certainly the best educated soldiers of their time ; while Lee, Jackson, and Sherman probably knew more of war before they made it than anyone else in the United States.

But it was not until 1866 and 1870 that the preponderating influence of the trained mind was made manifest. Other wars had shown the value of an educated General, these showed the value of an educated army.' - The Science of War, p. 3.

*A noticeable feature in most discussions on military questions is that the different parties to the discussion attach to the same terms different meanings, usually leading to complete misunderstanding.*

*To avoid this it is as well to define terms as they are used.* From the alternative meanings given in the ' Concise Oxford Dictionary ' we have selected the following :

1. a Principle is : "a fundamental truth as a basis of reasoning."
2. a' Command is : "control, mastery, possession."

From these definitions it follows that "the principles of command" as regards the command in the field of an army, are "the fundamental truths" which are the bases of reasoning about "the control or mastery of an army in the field".

From this definition itself springs the first fundamental truth about command:  
"Command" implies control or mastery of an army by a commander.

From this first fundamental truth follows the corollary that *"an army is trained, organised, and employed in such a manner as to admit of control or mastery"*

## Notes on "Civil Aviation"

The second principle of command is: "that *if any body of troops* is so trained, organised, or employed *as not to admit of control or mastery*, that body of troops, whatever else it may be, most certainly is not commanded"

The command, control or mastery of a body of troops is useless unless it tends to the accomplishment of the end in view in war, being "the defeat of an enemy in battle".

Any species of command, control or mastery which conflicts with "the defeat of an enemy in battle" is bad and is to be discarded.

Hence it follows that the third principle of command is that:

The commander should:

1. have a clear idea of how he proposes to use the instrument in his hand,
2. have a clear idea of the purpose for which it was forged—the winning of battles,
3. in fact possess adequate knowledge and capacity.

in 1813 Napoleon wrote to his marshal Marmont explaining his "scheme" (Programme) of operations, and asked for Marmont's opinion.

Marmont's reply contains this sentence :

"It is to be feared that on the same day your Majesty wins a great victory, you will learn that your subordinates have lost two"

Marmont knew that his comrades in arms, with but few exceptions, *were not fit for the command of armies, however skilful they might be in handling their own corps*.

The form of war Marmont made depended for success [as in 1805 and 1806] on the skilful command of "detachments", though the detachments had grown from "detached corps" in 1805 to "detached armies" in 1813.

Napoleon, the commander, still knew what he wanted to do, but since his detachment commanders no longer played their part intelligently his army can no longer be considered controllable for the purpose in view, and, as a consequence, his mastery over his army was no longer adequate.

This meant that in Napoleon's later campaigns the first and second principles of command no longer harmonised with the third principle of command.

What is of importance, and of direct bearing on the training and employment of the British army to-day, is to examine the underlying causes of the inadequacy of Napoleon's army in 1813 and 1815 to carry out the master's conceptions.

Unquestionably the material of the army had deteriorated, the ranks were full of half-trained conscripts who were not the equal in fighting worth of the veterans of the Grande Armée.

Moltke was widely read in military history and a deep thinker on war.

He had studied the best books that had been written up to his day on the campaigns of Napoleon, and noted that:

*"one important element in the ultimate overthrow of the Emperor Napoleon was the failure of Napoleon's marshals to harmonise the principles of command owing to their neglect to provide for their army(s) "subordinate commanders" capable of intelligent co-operation when removed from the immediate control of the commander-in-chief" - Moltke*

Success in war appears to be dependent upon harmony in the principles of command.

Misconception of the natures of "doctrine" and of "tendency"

The correct definition of ' doctrine ' is ' what is taught ' or "general body of instruction"

This is the meaning which Colonel Foch attaches to his use of the word in his brilliant and illuminating book on war.

A ' tendency,' on the other hand, is ' a bent,' ' leaning,' or ' inclination.' \* Concise Oxford Dictionary, p. 244.

t Des Principes de la Guerre, p. 7. % Concise Oxford Dictionary, p. 909.

By \* doctrine ' they understand a general body of teaching, leading those who hold it to see the concrete problems of war in the light of the general body of instruction which they hold in common.

## Notes on "Civil Aviation"

Hence, given that the same problem is presented to different commanders bound together by a common doctrine, that 'particular' problem will appear to each commander under the same aspect, and consequently whatever solution that problem calls for will be the one which commends itself alike to each of those commanders.

It most emphatically does not imply that any attempt is to be made to fit one solution to two or more essentially different problems.

We must be clear, therefore, as to what is meant by a 'problem of war,' and not confuse the 'problems of war,' which are not infinite in number, with the situations which arise daily, hourly, even oftener, and may be infinite in their variety. A problem is : a doubtful or difficult question, a proposition in which something has to be done. A situation, on the other hand, is : a set of circumstances or position in which one finds oneself.'

The 'doctrine of no doctrine' follows directly from an empirical conception of war. It involves the consequence that *the training of an army is to stop short of any attempt to train the minds of commanders.*

They are to be perfected in the technique of command, but obviously any attempt to mould their mentality is to be deprecated as tending to give the mind a bent, inclination, or bias *which may prejudice it in examining*, on their own merits, the infinite variety of situations which war presents for consideration and action.

The task of ensuring unity of effort from men trained under such diverse conditions is insuperable unless their minds are guided and bent in some one definite direction by the assimilation of a common doctrine as recognised by the General Staff.

For those who have eyes to see, and who will read 'Field Service Regulations, 1909,' in conjunction with 'Infantry Training, 1911' [the latest pronouncement of the General Staff, published only in September 1911] it will be apparent that step by step, slowly but surely, the General Staff is endeavouring to guide our army along the only road which leads to unity of effort in war and harmony in the principles of command.

Field Service Regulations is imbued with the offensive spirit, yet it tempers that spirit by a wise advocacy of postponement of decisive attack until the defender has been marked down, fixed and exhausted by the action of a portion of the attacking army. pg 141 the SOVEREIGNTY OF THE AIR. -

Article no. VII — the SOVEREIGNTY OF THE AIR.

1. The Aeroplane, Past, Present, and Future. By C. Graham White and H. Harper. London : Werner Laurie. 1911.
  2. The Conquest of the Air. By Alphonsb Berget. London : W. Heinemann. 1909.
  3. Mes trois Grandes Courses. Par Andre Beaumont. Paris: Hachette. 1912.
- Army Review, for July and October 1911.  
Times, February 25, 1911.

For centuries Englishmen have been accustomed to the idea that a strong navy is a guaranty of national security and of empire.

Other nations, during the last twenty-five years, have adopted our standpoint about the sea, and our belief that commercial interests are promoted and safeguarded by spending money upon ships ; and so it has come about that in shipbuilding all the Great Powers now seem to see the secret of national pre-eminence.

The advent of the "Dreadnought" gave the nations, even those most backward in naval matters, the chance of making good their disadvantage, for the 'Dreadnought,' by outclassing and demodging [?] smaller and older ships, made it possible for every country, as it were, to start even and from approximately the same platform.

And so Power after Power announces the launch of new capital ships, and people after people groan under the burden of fresh armaments.

We Englishmen are well accustomed to look to the sea, whence our help hath come in the past, but as yet we are not well accustomed to look up for it to the skies.

*We know the value of sea-ships ; we do not as yet realise the value of air-ships.*

We do not see in aircraft *the latest safeguard of national existence* ; we see in it a new sport, a new amusement, an excuse for motoring to Brooklands, or for spending a summer's day beside the Thames..."

## Notes on "Civil Aviation"

"Some sailors say that the publication of Mahan's book 'The "Influence of Sea Power upon History"' has been greatly responsible for opening the half-shut eyes of other nations to the value of command of the sea, and that in a way it has done us more harm than any book ever published.

This we may take for what it is worth, but it leads us to wonder *what book is to be written that will open our sleepy English eyes to the vital importance of command of the air.*

Nothing is more startling in the history of human endeavour than the progress made in aviation during the last five years.

autumn 1906 : Santos Dumont enters his flying machine in the "Archdeacon Cup". To win the Archdeacon Cup one must fly 25 without touching the ground. Santos Dumont flew 80 yards at a height of 3 feet. Three weeks later Santos Dumont flew 230 yards.'

1907 : Santos Dumont's 230 yard record was beaten by Henry Farman with 311 yards at a height of 8 feet.

January 1908 : The 1st "mile thru the air" was completed

April 1908 : De laGrange, one of the pioneers of aviation, remained in the air for just over 9 minutes.

In 1911 many sensational feats were accomplished, such as:

1. a height record of 13,944 feet without a passenger and
2. a height record of 9800 feet with a passenger ;
3. a speed of 110 miles an hour without a passenger, and
4. a speed of 83 miles an hour with two passengers ;
5. a flight in a forty-mile wind,
6. a non-stop flight of 447 miles and 11 hours in the air,
7. a stopping flight of 770 miles across country in one day,
8. a flight with 13 passengers ;
9. the crossing of the Pyrenees, Apennines, and Rocky Mountains.

The aeroplane is a part of the equipment of the modern army as vital to its efficiency as motor transport and wireless telegraphy.

It is a weapon whose use we have not completely gauged, whose value we have not fully appraised.

So utterly unaccustomed are we to reckon with it in studying war that we fail to realise its possibilities, fail to realise that success or failure in war may be in this the latest weapon forged by man.' - *Captain Burke - lecture given by Captain Burke, of the British Army Air Battalion, at the United Service Institution November 1911,*

*The mechanics and assistants—the rank and file of the air corps—require a more skilled and specialised education.*

Each of the twenty army corps will have an aviation section as part of its organisation in the same way that it now has cavalry, artillery, army service corps,

M. Messimy also foreshadowed the probability of each regiment of artillery having special aviators attached to it.

The new "scheme" (Programme) of organisation will require several hundred pilots ; officers and non-commissioned officers will be eligible for this post.

The completion of the organisation depends on the rapidity with which pilots are forthcoming.

*In France, the Birds of War are no longer, as the 'Matin' so elegantly phrased it "abandoned to the Winds of Chance" but with us it is, for the present, different. And there are excellent reasons for this, for there are undoubtedly great difficulties in organising an air corps even when flyers and machines are to be had in plenty.*

For one thing it has of necessity to be *a corps of all arms, for which suitable officers must be drawn, irrespective of rank*, from both the army and navy.

*The mechanics and assistants — the rank and file of the air corps—require a more skilled and specialised education than the ordinary [Royal] Engineer private ever receives.*

In fact *the mechanic suitable to take charge of an aeroplane is the sort of man who could command a good salary outside the army.*

The question of *the internal organisation* of any air corps offers many problems, *since such different sorts of work may be demanded* of pilots and observers.

For example:

## Notes on "Civil Aviation"

1. for locating guns and directing fire, artillery officers would be needed :
2. for the important work of reconnoitring and photographing fortresses and defence works, engineer officers ;
3. for tactical and strategic reconnaissance, staff officers trained to observe the signification of the movements of troops.

How is this heterogeneous collection of arms to be welded together into a harmoniously working and efficient corps ?

The air corps, besides demanding of its officers that they should be efficient pilots, general observers, and map readers, *must also, as we see, make demands of a highly specialised nature on individual officers.*

It is small wonder that English military authorities are slow in formulating their "scheme" (Programme) of organisation, and in setting forth the objects for which aeroplanes will be required in war, but we can hardly believe that the despondent attitude of the commandant of the Air Battalion, Brevet-Major Sir Alexander Bannerman, in his two articles on Aeronautics in the Army Review, is justified.

Brevet-Major Sir Alexander Bannerman:

1. deprecates the enthusiasm for aircraft shown by those who have but superficially studied the subject of aeroplanes, from which enthusiasm he has doubtless suffered, and
2. directs our attention to the difficulties of transport and maintenance of this new arm under war conditions.
3. sees in our insular position an inherent obstacle to the use of aeroplanes, for he can point to no English frontier fortress in which aircraft can be comfortably stabled after reconnaissance.
4. assumes that in two or three years' time we may know definitely the offensive and defensive values of aeroplanes and dirigibles, and [as we understand him] he
5. considers that no ' aeroplane policy ' can really be formulated with regard to our insular army until these values are ascertained.

There is a most noticeable want of enthusiasm in these articles, but we are encouraged to hope that everything is not looking quite so despairing in the Air Battalion as it was earlier in the year.

In July the commandant expressed his fear lest it might be difficult to get a sufficient supply of military pilots in a small and voluntary army, the conscript army having so much greater a choice of material.

In October we find him gloomily stating that there will be more pilots forthcoming than possibly can be used.

As a nation we at least have the satisfaction of knowing that we have produced the second largest number of pilots in the world. Though we quite understand, as we have said, the difficulty of formulating a "scheme" (Programme) of organisation and of setting forth the objects for which aeroplanes will be required in war, we do not see any reason why the Government should have hesitated so long about the type of machine required for military use, unless it has been influenced by Sir Alexander Bannerman's pessimism.

Since the Air Battalion has been created, and since it is shortly to have 100 officers, it must have machines for them to practise on.

The French military authorities actually *formulated their demand as to the type of aeroplane they needed two years ago*, and to this demand French constructors build.

The conditions essential for French military aeroplanes in October 1911 were :

1. That the aeroplane and motor be constructed in France.
2. That each machine be able to fly 300 kilometres (187 miles) in a circle without a halt.
3. That machines should be able to carry 300 kilos of useful-weight (exclusive of petrol, oil, water, 'etc.).
4. That it must be three-seated.
5. That it must rise 500 metres in 15 minutes with full complement
6. That it should be able to fly 60 kilometres an hour (37 miles).
7. That it should be able to descend in plough, crops, meadows, stubble, and be able to get of again at once.
8. That it should be easily transportable by road or rail, and easily and quickly put together.

The prizes offered by the French Government at the Military Concours are:

1. From the competitor who has come in first:
  1. Buying of the winning machine at 4000L and

## Notes on "Civil Aviation"

2. An order for ten similar machines at 1600L. apiece.
2. From the competitor who has come in second, six machines are ordered at 1200L each.
3. From the competitor who has come in third, four machines are ordered.
4. Additional conditions as to speed obtained:
  1. a premium of 20L per kilometre on all speed over 60 kilometres,
  2. a premium of 400L for the speed of 80 kilometres
  3. Hence the successful competitor could not win less than 20,000L. and might win more.

The conditions of the British competition, and rightly so, are to be far harder than those of the recent French competition.

Any machine which emerges successfully from the British Government tests will be a great advance upon any existing aeroplane and will embody improvements which can only be the fruit of many experiments. Such experiments cost money, a great deal of money, and it seems as though the prizes offered would not admit of any but rich and well established firms competing.

Hitherto it has been through the munificence of private persons that national interest in aeronautics has been stimulated, in particular by Lord Northcliffe:

1. In 1909 Lord Northcliffe offered 2000L to any airman crossing the Channel,
2. in 1910 Lord Northcliffe offered 10,000L to any airman flying from London to Manchester, and
3. in 1911 Lord Northcliffe offered 10,000L to any airman flying the Anglo-Scottish circuit.

Thus Lord Northcliffe, a private individual, has already expended in prizes a sum double that which our Government is prepared to devote to the encouragement of aviation in England.

But since an official prize competition has at last been inaugurated, it is not without interest to note what hitherto has been the official attitude towards the aeroplane.

There is not very much to go upon, but at any rate there are the speeches of the members of the Government in charge of the War Office as well as the two articles, already alluded to, by the commandant of the Air Battalion.

February 1911 : Lord Haldane, in his Memorandum on Army Estimates, states: "great efforts had been made to enable the army to participate actively in the present 'development of aeronautics,' and that five aeroplanes were available for army work, of the Wright, Farman, Paulhan, Bleriot, and Havilland types respectively"

He also expressed a hope that a new army dirigible, the Delta, would be launched at the end of April and that two large airships of foreign manufacture would be ready for use in the summer.

The summer of 1911 came and went, and where did the airships sail to ?

Who dared fly the prehistoric Wright aeroplane ?

or drive obsolete Bleriot XII. ?

"Where were the army pilots who could fly the Havilland ?

The number of times the Paulhan went out might have been counted on the fingers of one hand.

The 'large airships of 'foreign manufacture,' alias the 'Morning Post' and 'Daily Mail' ships, we believe to be still waiting repairs at Farnborough.

The Delta has not yet made her appearance.

The old-fashioned Farman biplane alone was left to the army officer in which to participate actively in the present development of aeronautics.'

In the House of Commons on the 27th of October Colonel Seely in answer to a question from Mr. La Touche: announced that sixteen aeroplanes had been bought or acquired for the Government,

In the House of Commons on the 29th of October Colonel Seely in answer to Mr. Sandys [who suggested that as the Air Battalion were only in possession of ten aeroplanes the Government had still six to buy] Stated that we had 'about sixteen aeroplanes,' and Stated a few words further on 'that we really had nineteen aeroplanes, but one of these was broken beyond repair and another was out of date.' Stated also that the Government was the fortunate possessor of eleven types of machines, as an effort had been made to try all types.

## Notes on "Civil Aviation"

Hope rises eternal in the human breast and we felt uplifted in hearing that we had 'about sixteen aeroplanes,' since the presumption was that they were all machines that could be used in the field.

But what did we find on investigating this matter ?

1. six were "out-of-date machines" suitable for training purposes only,
2. that of the two Valkyries given by Mr. Barber to the Army:
  1. one had no engine and
  2. the other was still in pieces after the accident which occurred on its only flight, an accident in which one of our most gallant aviators, Lieutenant Cammell, was killed ;
3. the Paulhan biplane had seldom been flown.
4. there were four fast modern machines fit to take the field, three of which had at that date never been flown by any army pilot.
5. only scattered traces of those other dismembered and antique' machines could be found, which brings the total up to about 'sixteen ' or ' really nineteen.'

To man this strange and motley fleet we had:

1. seven army pilots,
2. no observers and
3. no [support] personnel.

Colonel Seely's answer, though not untruthful, is misleading, and we cannot insist too strongly that the army *is not the place* for trying 'all types of machines.'

The army is no place for experiments.

Experiments should be conducted outside its precincts by the aeroplane manufacturers, as in France.

Anything else is waste of public money.

What a situation for a Great Power to find itself in on the outbreak of war !

It is obvious that good-naturedly to assure us of the mere existence of aeroplanes in England is foolish in the extreme, if it is nothing worse, as it shows no grasp of the essential features of the problem of military aviation.

What ordinary Englishmen want to be sure about is *that there is a well equipped group or corps of aeroplanes ready to take the field to-morrow, complete in every detail:*

1. with pilot,
2. with observer,
3. with mechanic, and
4. with three men,
5. with motor lorry,
6. with transportable shed and
7. with spare parts.

Now judged by this standard we had last autumn no aeroplane fit for immediate service and this in spite of the fact that in the past year we spent 150,000L on this service and killed two military aviators.

Members of Parliament should make it their business to know not only whether aeroplanes exist but whether they are properly organised for war.

Optimistic generalities such as those given by the Under Secretary for War on the 27th and 29th of October only throw dust into the eyes of the general public.

**Public opinion must be trained** to interest itself in this presently most vital question—really interested, not stimulated in a spasmodic way, as it was over the dirigibles.

It is probable that not one in all the hundreds of persons incited by the 'Daily Mail' and 'Morning Post' to clamour for airships in 1910 could tell us what those airships have done or even where they are.

They both arrived in this country in October 1910.

The "Lebaudy" ship is in pieces awaiting repairs to her envelope and cradle that were necessitated by an accident that occurred during her only outing in this country on the 4th of May 1911. She has never been put up for the War Office tests as originally

## Notes on "Civil Aviation"

arranged, or been put in commission as a training ship for observers. At any rate, if she had been tested and had failed to pass the tests she might have been returned to France and been replaced by a more efficient machine, since she was only sent over 'on approval.'

The hangar at Wormwood Scrubbs is empty owing to the fact that the "Clement Bayard" is lying in pieces at Farnborough, waiting for renewal of the defective envelope which was purchased with the machine.

At present we have but two army airships, the Beta and the Gamma, in use, and one, the Delta, announced by Lord Haldane to appear in April 1911, is still being built.

First of all ought we not, since we have lost so much time already, to acquire a small nucleus of aeroplanes from foreign sources for our Air Corps, *so that at least we have something to use immediately in the field should occasion demand it?*

Something in which to train our officers for active service?

*"on the outbreak of war, a haphazard aggregation of individual machines and pilots **can not be relied on**" - Colonel Capper*

For *in order to attain any degree of comparative safety in war time, when their nerves will be additionally strained, they must fly machines to which they have become accustomed in peace time.* This, in our opinion, is the necessary first step towards efficiency, and it is a step that should be taken at once without waiting for the results of the Government Prize Competition.

1. the best military machines must be provided, and
2. the best military machines kept up in peace, and
3. numbers of officers be thoroughly trained in their uses by constant practice,
4. numbers of men be thoroughly trained in their uses by constant practice,
5. officers and men be thoroughly trained, both as individuals and as units of regular flying squadrons.'

Let us consider for a moment the most simple and obvious ways in which we could become possessors of a well equipped even though small aero fleet.

1. The four leading French firms have schools, and
2. it might be a good plan for a British officer and mechanic to be sent to each of these firms for two months in order that they may thoroughly learn to understand the particular type of military machine made by the firm, and then
3. four machines should be purchased of each type ;
4. four preferably, as they would make a handier group.
5. Each of these groups should be accompanied by the mechanic trained in France.
6. The officer should be responsible for training the personnel allotted from the Royal Engineers to the aeroplanes in his group.

We agree with the commandant of the Air Battalion that:

1. there should be as few varieties of machines as possible, and
2. parts should be standardised within homogeneous groups.

The important thing is:

1. that each aeroplane group (whether it consist of two or four machines) should be kept separate,
2. that parts and pilots [for the group] would be immediately interchangeable, and
3. one of the group would always be ready for active service.

**We lay great stress on the fact that the machines of each group should be of the same type.**

Stability in aeroplanes depends almost entirely on the action of the pilot, and the methods of control vary in different aeroplanes. In gusty weather the balancing must be instinctive on a known machine.

Pilots say that it takes six weeks to get to understand a machine of a different type, therefore it is very dangerous to expect a man to fly a type other than his own, and even machines of the same type vary.

A pilot highly skilled in one type of machine may be quite incapable of driving another type except on an absolutely calm day.

It is of the highest importance that officers:

1. Should be familiar with the machines they will have to fly on active service, and also

## Notes on "Civil Aviation"

2. That they should have a basis of common understanding and mutual confidence with the observer they carry, an understanding that can only be arrived at by many flights together in peace time.

In any case if the French themselves were at war:

1. it would be useless to expect them to supply spare parts to other nations,
2. it is certain that in such an eventuality no single Gnome engine would be allowed to leave the country.

The average life of the Gnome engine is only 100 hours in the air, after that period many of the important parts have to be replaced.

The necessary third step towards efficiency would be, in our opinion, to remove the head-quarters of the aeroplane section away from Farnborough.

The whole country is extremely difficult to fly over, but Laffan's Plain:

1. is surrounded by trees which, as all aviators know, cause dangerous 'remous.' Cross-country flying is discouraged by this belt of trees which is encountered in half-a-mile in any direction, for no aviator can tell in a minute or two whether his engine is really working properly.
2. the landing there is bad, as the surface is composed of long rough grass, and small bushes dangerous to the inexperienced aviator.

The Government has at its disposal admirable ground for training aviators on Salisbury Plain:

1. the Bristol School has trained large numbers of aviators without any accident at all.
2. The surface of Salisbury Plain is undulating, but it offers any amount of good landing places.
3. It is, of course, not so perfect as the French aviation grounds, which are flat and of great extent, but it is safe and the place par excellence in which to establish an Air Battalion.

All our peace preparation must obviously take the form of organisation for war.

Most emphatically we must not waste the first half of 1912 as we have wasted the whole of 1911.

We must not wait until the competition is over to give our airmen the most modern machines to practise on, for above the strife of parties and the din of competition sounds the clear call of Patriotism.

It is sounded by the military aviators who, for the sake of their country and for no earthly gain, are willing to risk their necks in prosperous times of peace.

No machines, after all, can be too good, as no honour can be too great for the army pilot.

Every nation must be proud of the men who are ready to live[give] their lives on terms of active service.

Things have been made needlessly difficult for military aviators in England.

Has not the time come to give them every facility to place their dangerous art at the service of their country?

In conclusion we must confess to being haunted by:

1. *the thought that "the sovereignty of the air" may one day make "sovereignty of the sea" a thing in itself of no account ;*
2. *the thought that "command of the air" may come to connote "command of the sea".*

Given:

1. automatic stability,
2. increased airworthiness and
3. accuracy in attack through explosives dropped from above,

in short, steady progress on what are the natural lines of development for aircraft,

May not the aeroplanes and dirigibles of a power which commands the air master the battleships of an island state which has trusted for security too exclusively to sovereignty of the sea?

1912 : British grammar school intake : "selected students judged capable of benefitting from additional education".

Magazines extolling "derring-do" and "adventure" were extremely popular in the late 1800's early 1900's.

## Notes on "Civil Aviation"

January 1912 : First Successful "Wireless Controlled" Artillery Shoot

Captain H.P.T. Lefroy R.E, as observer and Geoffrey de Havilland piloting, the B.E.1 was flown in the first successful wireless - controlled [meaning "directed via radio"] artillery shoot over Salisbury Plain.

There was no such thing as "Canadian citizenship" until 1947 <sup>43</sup>, thousands of Canadian Expeditionary Force (CEF) volunteers in WW1 were recent British immigrants <sup>44</sup>; other recent immigrants from Great Britain may have gone back to England to enlist in British units <sup>45</sup> Canadians trickled into the British flying services by different means <sup>46</sup>.

There was no air recruiting office in the Canadian Department of Militia <sup>47</sup>, British officers on the Governor General's staff found numerous young men volunteering to join the flying services. <sup>48</sup> After April 1915, : British [Army] officers actively sought out enlistments from Canada.

March 1912 : To date since 1910 the Royal Aero Club has issued 8 Dirigible pilots' certificates, 7 were held by Officers of the British Army.

14 March 1912 : South Farnborough, England : Experimental Bleriot Type #1 "B.E.1" (with ref to his sketch #10) is test flown by Maj. S. Heckstall-Smith ( Major S. Heckstall-Smith, R.F.C. to Temp. Lieut.-Col. R.F.C on 1st Sept. 1917) for the Superintendent of the British Army's Aircraft Factory. Maj. Heckstall-Smith personally Certifies :-

- a) that "Aeroplane B.E.1 has been thoroughly tested by me, and
- b) the Mean Speed over a 3/4 mile course with a live load of 25 stone and sufficient petrol for one hours' flight is 58-59 m.p.h.
- c) The rate of rising, loaded as above, has been tested up to 600 ft and found to be at a rate of 185 ft per minute.
- d) The machine has been inverted and suspended from the centre and the wings loaded three times the normal loading.
- e) On examination after this test the aeroplane shows no signs of defect.

This forms the "B.E.1 Certificate" given to the aeroplane.

May 1912 : Lefroy fits a generator, driven by bicycle chain from the engine, to the same B.E.1 flown in January.

Experiments continued using descendants of the B.E. 1 through to 1913 and 1914.

1912 : Wilbur Wright' is killed - Orville later sells his interest in their patent to Wright-Martin Company.

13 April 1912 : Royal Flying Corps established:

The recommendations by the Committee of Imperial Defence result in a Royal Warrant being issued to constitute a "Royal Flying Corps".

The British Imperial Government publishes a "White Paper" [command paper?] giving details of its formation; a sum of £320,000 had been allotted to the War Office for this purpose and £90,000 was to be spent on a new aerodrome at Upavon on Salisbury Plain.

A total of 36 new aircraft [half of them British built] had been ordered to supplement the sixteen already owned by the Army.

25 April 1912 : London, the Government announces "plans to train 120 officers and men for Air-ship work" src - 37 HC Deb 51, 1382. Their training begins at Aldershot, similar to that of Cavalry, only AFTER they were able to demonstrate they could command their new mount were they admitted to "Service Schools" ..the new pilots would have to obtain their Royal Aero certificates first, and that officers would have to pay for for their own "Cross country flights" in service machines - and then get some reimbursed for the cost, thanks in part to protest in parliament, pg 21 british airships 1908 - 1931.

## Notes on "Civil Aviation"

May 1912 : The first aeroplane takes off from a moving ship in Britain.

18 June 1912 : Desmond Arthur granted Royal Aero Club certificate No.233 after completing flying trials in a Bristol-Prier monoplane at Brooklands.

30 June 1912 : United States Aeroplane exports

Over the past 12 months, the United States has exported 27 "American-built" aeroplanes valued at \$105,805 while 17 machines valued at \$59,713 were imported into the U.S.A. <sup>49</sup>

July 1912 : formation of the Royal Flying Corps (RFC) under control of the British Army

04 July 1912 : The Inauguration of the Central Flying School of the British Military, Upavon. <sup>50</sup>

Thursday 04 July 1912 marked the advent of the flight of the first aeroplane at the RFC's Central Flying School at Upavon, Wilts.

The official list of staff for the School will not be published until October, 1912.

Captain Fulton, R.F.A., flew the first machine to arrive at the school from Farnborough in a 20 m.p.h. wind.

The machine, a 50 h.p. Avro biplane, behaved splendidly, the distance of 50 miles being covered in 1\ hours, or about 60 m.p.h., allowing for the 20 m.p.h. head wind. He landed at 4.30 a.m.

Captain Gerrard, R.M.L.I., also started from Farnborough on a new 70 h.p. Short biplane, a two-seater, side-by-side type ; but, owing to plug trouble, he- was forced down at Oakley.

Misfiring commenced about ten minutes after he started, yet he kept on for almost an hour, in a high wind, until eventually compelled to alight.

After having new plugs put in, he got away from Oakley in the evening, and landed at the school at about 7.30 p.m.

The wind was very strong when he landed, and for lack of good landing ground he came down on some soft land.

Fortunately nothing was broken. src CG Grey : The Aeroplane. July 11th, 1912.

05 July 1912 : The Stonehenge Accident - 2 Pilots killed in a Nieuport monoplane <sup>51</sup>

Captain Eustace Broke Loraine, Grenadier Guards (seconded for duty with the RFC) and Staff-Sergeant R.H.V. Wilson, R.E - mechanic, RFC, were killed while flying a Nieuport monoplane which was seen to bank over for a sharp to the left to reach Lark Hill, drop its wing [stalled] and then dive into the ground. Lieut. Fox [flying in the area?] landed at the scene and found both men still alive, extracted the men from the wreck and made them as comfortable as possible, he then flew for assistance.

Minutes after more help arrived, Sergeant Wilson died of a broken neck.

Captain Loraine's right thigh and left ankle were broken and he was taken to Bulford Military Hospital, where he died ten minutes after his admission [It was at first thought that his skull was fractured, but autopsy proved this not to be the case] and his death was put down to "general shock to the system" [being massive injuries to his internal organs].

The Cause of the Accident.

It was fairly clear that the accident was caused by over-banking, however Captain Loraine was noted to be "a skilful pilot not likely to make such a mistake" from lack of knowledge. [was Staff-Sergt. Wilson in control of a dual control machine ??]

Possibly contributory causes of the accident:

1. *the strange downward remou which is known to exist* over and about Fargo Wood and Stonehenge.
2. The steeply banked turn, and possibly a momentary mistake in the use of the controls on a machine which is known to be "tricky in handling"

It was definitely established that all control wires were in working order after the accident.

The pilot's error was more probably primarily due to the custom, which cannot be sufficiently condemned, of allowing pilots to fly a variety of different machines, many of which had entirely different control systems.

---

## Notes on "Civil Aviation"

### Flying the Nieuport <sup>52</sup>

1. warping of the wings (rolling) is done with the feet, and
2. the steering (rudder) by moving the lever.
3. up to a point, the lateral stabilising can be done with the lever operating the rudder, as in the usual system:
  1. in turning to the left the lever is pushed to the left, the machine goes round to the left, and the right wing banks up.
  2. If the aircraft banks too far, a sudden movement of both the lever, and the rudder, to the right will swing the machine suddenly to the right and bring it up to an even keel ;
4. Once a side-slip to the left has started, the rudder would have no effect unless it were pushed to the left.
5. Pilots used to flying machines with the ordinary lever actuated wing-warp and rudder-bar steering, might:
  1. Try to steer to the left with his feet thus increasing the banking up of the right wing, and
  2. try to warp the left wing up with the lever, so preventing the rudder from acting at all.
6. If this happens, the Nieuport would, in time, get its nose down and dive, but by then it would have reached a very big speed, and be slow in getting its nose up again.
7. There has long been an opinion in France that if a Nieuport gets past a certain angle in diving it will not come back at all.
  1. this has never been proved.
  2. it seems possibly - for one may assume that the curves of the body aft are designed to give the correct streamline at the designed speed of the machine.
  3. Now, if this speed be, say, 75 miles per hour, and the speed in diving be increased to, say, 120 miles per hour, it seems quite possible that the blunt entry of the machine may, at that speed, set up eddies which only meet at a point some distance behind the tail and elevator, for the Nieuport body is very short.
  4. If this were so, it would mean that the elevator and rudder were working in the eddies left by the blunt entry, and so would be slower to act, or it is even possible that the body and wings might set up such eddies that the elevator would not work at all, and so the machine would never come up, if she once dived.

Certain British monoplanes with short bodies are very sensitive to the controls at their proper flying speed, and alleged to be very slow in coming up if dived too steeply. The point is one which needs to have careful research work devoted to it.

But the two chief points are that <sup>53</sup>:

1. Pilots should fly their own machines and no others, except under special circumstances, and
2. all controls should be standardised.

In time it will even be better to standardise machines as well. <sup>54</sup>

There are bound to be various types for various purposes, just as there are various types of guns, but each type should itself be standardised as soon as possible.

### July 1912 : Don't attempt to learn Aviation as you would learn Cycling.

Ensure success by getting first a thorough technical knowledge of the whole mechanism of the aeroplane.

There is no better way of getting that groundwork of success than by taking an I.C.S. Course in Aviation You are taken from the first principles to the most advanced data.

By means of the simplified, easily-mastered text books and instruction papers, your progress is rapid in acquiring sound and accurate knowledge.

Two I. C.S. Aviation students write :

"It gives us great pleasure to bear testimony to the value of I.C.S. Instruction. We have taken your I.C.S. Course for some time and have greatly benefited by it. We have attended one of the best technical schools in the kingdom, but taking everything into consideration it has no comparison with the Course we are now taking with the I.C.S." - H. H. & J.H JAMES, Narberth, Pem.

## Notes on “Civil Aviation”

August 1912 : the British **Military Aeroplane** competition:

Entrance requirements:

Aeroplanes entered into the competition:

1. must have an engine capable of being started easily.
2. should have an engine capable of being started from pilot's seat
3. Must be able to stay in place by itself with engine(s) running - no holding it back using men.
4. Must have seating for pilot plus at least 1 observer
5. BOTH Pilot and observer(s) must have best possible view of the ground from their positions  
Testing of this was accomplished using the aircraft placed in flying position on the ground over a grid.
6. Must have Dual Controls
7. Must provide the pilot and observer(s) with Shelter from the wind and elements
8. The Pilot and the Observer(s) must be able to communicate with each other.
9. ALL parts of the airframe [and the engine?] are to be interchangeable.
  1. Like parts must be interchangeable with each other
  2. Like parts must also be interchangeable with “sample parts” selected from spares-stock
10. The Aircraft must be:
  1. capable of “quick” dis-assembly and re-assembly in the field.
  2. Transportable by road, either on it's own wheels or by trolley
  3. Width when packed for road travel must be max. 10 ft
  4. Packing case suitable for rail shipment case must be included. Case must break down for storage in min. space.  
Testing of dis-assembly and re-assembly
11. Engines should be silenced - optional.

Speed:

Operation: The operation of the aeroplane must not place undue stress / strain upon the pilot (ease of control / lightness of controls / simplicity of controls /

Categories for entry:

- A. British Designed Aeroplanes, British Built & using British Engines
- B. British Designed Aeroplanes, British Built & using Foreign Engines
- C. Foreign Designed Aeroplanes, British Built & using Foreign Engines
- D. Foreign Aeroplanes

Judges of the Aeroplanes in the competition:

1. Brig-Gen David Henderson, Dir. Military Training
2. Capt. Godfrey M. Paine, R.N - Commandant RFC's CFS
3. Maj. F.H. Sykes, Officer Commanding, RFC
4. Mervyn O'Gorman, Superintendent - Royal Aircraft Factory

In his work “The History of British Aviation” author R. Dallas Brett states “It was regrettable that their ultimate judgement fell so far short of their organising ability” <sup>55</sup> in his book, however, when one considers what was being discussed behind closed doors - that most persons of the day would be ignorant of, the trials were quite telling as it revealed to the people charged with fielding a force, exactly what Great Britain was capable of of fielding, as well as where her weaknesses lay in comparison to her competition in the event the Empire went to war and aircraft were launched into the fray.

Aeroplanes entered for the 1912 British Military competition (31)  
Green = competed

14 students of this total were foreign, 3 self taught pilots are not reflected in this total. Additional British pilots 8 not included were 8 qualified in France and 6 qualified in the United States in 1912. To date 385 pilot certificates had been issued by the Aero-Club to British subjects, while 21 pilots to date had been killed in flying accidents				211

### The Aerial League's National Subscription.

It has now been definitely decided that a national subscription is to be organised by the Aerial League throughout the United Kingdom.

## Notes on "Civil Aviation"

A number of notable persons, whose bona fides cannot for a moment be doubted, have signified their thorough approval of the idea, and the fact that the fund will be in the charge of the Official Trustee is sufficient guarantee that it will be properly administered.

Those who know General Arbuthnot, the chairman, and Colonel Massy, the vice-chairman, of the League, must realise the absolute honesty of purpose which actuates them in organising the fund, and the only reason that can prevent anyone from subscribing to it is a doubt as to the purposes to which the money raised may be put.

On this score it appears that there need be no anxiety, for it is the intention of the Council of the League to invite the Aeronautical Society and the Royal Aero Club to appoint a technical committee who will advise the Council of the League as to the spending of the money. The writer has talked the matter over at considerable length with Colonel Massy, and gathers that there is on this occasion no question of buying aeroplanes haphazard and presenting them to the Army, or of endowing a technical college for the education of would-be aeronautical engineers. Subject to the advice of the proposed technical committee, it appears that it is the intention of the Council to devote the money in the best possible way to fostering the growth of the British aeroplane industry, on the grounds that the best guarantee of an adequate aerial force in the future is a sound industry in this country, which would be in a position, when called upon, to equip the Royal Flying Corps with machines of the right kind at short notice.

This may be done by organising, some time in the future, a competition for all-British military aeroplanes built exclusively by British firms, with really handsome prizes for all competitors who pass a certain standard of efficiency, and it may be done at the same time by equipping public aerodromes in various parts of the country, which will help to raise local enthusiasm and keep it alive afterwards, and provide landing places for aviators who are flying about the country either for service purposes or for trade purposes.

In fact, the whole "scheme" (Programme) is arranged so that, acting on the advice of a thoroughly adequate technical committee, the £50,000 which it is proposed to raise may be made to produce really excellent results.

There should, as a matter of fact, be little or no difficulty in raising the money, and the replies which have been received from the authorities in various towns in the provinces to the letters asking them to co-operate have been almost invariably most encouraging.

The writer would, therefore, appeal to all readers of The Aeroplane to put themselves in touch with the Secretary of the Aerial League at Coventry House, Coventry Street, W., and ask that he will give them the address of the nearest collecting centre which is being organised, so that when the work of collecting really starts readers of the paper may do their part in the collecting.

<b>SCHEDULE OF LOAD FACTORS AND FACTORS OF SAFETY</b> <b>LOAD FACTORS SUB-COMMITTEE Reports and Memoranda, No. 673. January 6th, 1920</b>				
	<b>GENERAL CLASS</b>	<b>Total Weight of Aircraft.</b>		
<b>Item</b>	<b>Definition</b>	<b>Up to 3,000 lbs.</b>	<b>8,000 - 10,000 lbs.</b>	<b>Above 10,000 lbs.</b>
A	Load factor with C.P. in its most forward position	8	8 - 6*	6
B	Load factor with C.P. in the position corresponding to maximum horizontal speed at ground level	6	6 - 4.3*	4.5
C	Factor of safety in a terminal nose dive	1.75	1.75	1.75
D	Specified lift coefficient for fins and rudders. (Under this loading the factor of safety of the fuselage should be unity)	0.6	0.6	0.6
e1	Static load factor on undercarriages	8	8 - 6*	6
e2	Specified vertical velocity (ft/sec.) for determining travel of undercarriages	10	10	10
Note	* The decrease in load factor from the larger value is directly proportional to the increase in the weight of the craft.			

31 July 1912 : Hugh Trenchard Solos at the British Army's "Central Flying School".

## Notes on "Civil Aviation"

(Not overly gifted academically, he failed the entrance exams for the Royal Navy but after several attempts passed the exams for a career in the army.) became a second lieutenant in the Royal Scots Fusiliers. July 1901.  
Lord Kitchener, Commander-in-Chief, tasks Hugh Trenchard with creating a "new corps of mounted infantry".

September 1912 : Colonel Seely bans the flying of all monoplanes by pilots of the Military Wing of the RFC  
As a result of the break-up in the air of two monoplanes of different types whilst flying in normal weather conditions, the Secretary of State for War, Colonel Seely banned the flying of all monoplanes by pilots of the Military Wing of the RFC.  
The ban was finally lifted in February 1913.

October 1912 : The first appearance of the RFC as a separate unit. RFC Staff list is published in the "Army List", October 1912.

### 1. RFC - Central Flying School [@ Upavon]

Officer Commanding : Capt. Godfrey M. Paine, M.V.O, R.N

Ground and Air Instruction Staff:

Ground Instruction:

1. Aeronautic Theory: Col. H.R. Cook
2. Aeroplane and Engine Construction: Col. H.R. Cook

Flying Instructors:

1. Maj. E.L Gerrard, R.M
2. Maj. H.M. Trenchard, D.S.O ( Trenchard had been taught to fly by T.O.M Sopwith)
3. Capt. J.D.B Fulton
4. Capt. P.W.L Broke-Smith

Inspector of Engines : Engineer Lieut. C.R.J. Randall, R.N

### 2. The Military [Army] Wing [based @Salisbury Plain, *operate from Farnborough*]

Officer Commanding : Maj. F.H. Sykes

Adjutant: Lieut. B.H. Barrington-Kennett

No. 1 Squadron RFC: Air-Ships, Balloons & Box-Kites

Squadron Commander:

Flight Commanders:

1. Capt.

Flying Officers:

1. Capt.

Technical Officers:

No. 2 Squadron RFC: Air-Ships, Balloons & Box-Kites

Squadron Commander: Maj. C.J. Burke

Flight Commanders:

1. Capt. G.H. Raleigh
2. Capt. H.R.P Reynolds

Flying Officers:

1. Capt. G.W.P. Dawes
2. Lieut. C.A.H. Longcroft
3. Lieut. G.B. Barnes
4. Lieut. G.T. Porter
5. Lieut. C.T. Carfrae

Technical Officers:

No. 3 Squadron RFC: a.k.a the "Lark Hill" Squadron

Squadron Commander: Maj. H.R.M. Brooke-Popham

Flight Commanders:

1. Capt. C.R.W. Allen
2. Capt. B.R. W. Beor
3. Capt. D.G. Conner

Flying Officers:

1. Lieut. A.G. Fox

Technical Officers:

## Notes on "Civil Aviation"

### 3. The Naval Wing [@Eastchurch]

Officer Commanding : Commodore C.R. Samson, R.N

Flying Officers:

1. Capt. R. Gordon, R.M
2. Lieut. J.W. Seddon, R.N
3. Lieut. W. Parke, R.N
4. Lieut. C.J. L'Estrange Malone, R.N
5. Sub-Lieut. F.E.T. Hewlett, R.N

Technical Officers:

### 6. Reserve Wing [@ ??]

Officer Commanding : Brigadier-General D.C.B. Henderson, D.S.O, C.B.

Flying Officers:

1. Lieut. O. Gordon Bell

05 October 1912 : The London Polytechnic Aero Club and Flying Society,

owns two Weiss gliders, presented by Mr. Jose Weiss, a Wright type biplane glider, presented by Mr. H. Vaughan, and a 44 ft. span "portable" monoplane built at the London Polytechnic by students.

*The Wright especially has done a good deal of valuable service during the summer, and most successful week-end meetings have been held.<sup>56</sup>*

*The club has its headquarters at the Polytechnic, Regent Street, W., where technical and practical classes are held during the winter evenings.*

*This is the kind of club which deserves every support, but the "Poly. Ae. Club" not having courted publicity, is not very well known, and consequently not appreciated. We hope, however, to do big things in the future, and anyone joining now will be in time to start evening classes in Aeroplane Drawing and Design, Aeroplane Construction and Aero Workshop Practice, Aerodynamics, & etc. <sup>57</sup>*

*Thanking you for the valuable knowledge derived from a weekly perusal of your valuable paper. <sup>58</sup>*

November 1912 : Frederick Wanklyn of Montreal, graduate of Royal Military College, commissioned in the British Army in 1909, joins the British flying services, ends the war as a lieutenant-colonel - RAF. Pilot.

12 November 1912 : When aviation was young and hearts were high the Compagnie Generale de Navigation Aerienne (holders in France of the Wright patents) engaged M. le Comte de Lambert, a Russian nobleman, and Mr. Wilbur Wright's first pupil, to act as technical engineer and pilot.

But to-day, when the sky is grey, the company [the Compagnie Generale de Navigation Aerienne] has found the prosecution of others for infringement of the Wright patents pay better, and they have relinquished construction and the Comte de Lambert as well.

They thanked him graciously for his services. But that was all.

*The Comte de Lambert feels "aggrieved" and sues the Compagnie Generale de Navigation Aerienne in the High court with the result that they pay him £1,200 and costs.*

21 November 1912 : The Aeronautical Society.

Students:

1. attending regular science courses at recognised technical colleges,
2. attending engineering courses at recognised technical colleges, or
3. attending aeronautical courses at recognised technical colleges,
4. as well as those pursuing the scientific side of aeronautics professionally,

---

## Notes on "Civil Aviation"

are eligible for membership in the students' section, Aeronautical Society, and should apply before 31 December 1912, if desirous, of being admitted without entrance fee.

Applications should be sent to the secretary, 11, Adam Street, Adelphi, W.C.

The studentship of the Aeronautical Society is a branch of the technical side of the Aeronautical Society, which affords a technical status to those admitted thereto.

Student members of the Aeronautical Society may:

1. attend all Aeronautical Society meetings,
2. receive the Society's publications,
3. are admitted at half the usual membership fee, and
4. are exempt from payment of the entrance fee on transferring to associate fellowship. Src : the Aeroplane. November 21, 1912. pg 516

late 1914? : RFC and RNAS accept volunteers from Canada

The RFC and RNAS advertise that they are accepting volunteers from Canada who hold an Aero Club of America (ACA) certificate.<sup>59</sup>

1. Hundreds of young Canadians head to American flying schools or the Curtiss Flying School in Toronto, where they paid \$400 [or more] for "a basic course", got their "ACA ticket", were formally accepted, partially repaid by the British government, then sent to England.
2. As casualties in France mount in 1914 / 1915, the ACA certificate requirement was waived, then reinstated, and finally waived again.
3. By the spring of 1916, men were being accepted after a medical check and then dispatched to England to receive flight training.
4. The RNAS continues to recruit young men in Canada until January 1918; some 635 men were raised.
5. About half paid for their initial flight training before going overseas.
6. Informal RFC recruits numbered about 350 to the end of 1916.<sup>60</sup>

18 December 1911 : The Committee of Imperial Defense - Technical Sub-Committee on Aviation is created "*to examine the possibility of creating an aviation service.*" British Prime Minister H.H. Asquith.

The Royal Navy, otherwise known as "His / Her Majesty's Fleet" had a legislated requirement to understand engineering since 1860 - the year H.M.S Warrior was launched and Officers were required to be "Better qualified to handle Technical matters". Src : Robin Higham, The British Rigid Air-Ship, 1908 - 1931, pg 2

As such, the MANDATORY guidance materials for the "(Royal) Engineers" employed by His Majesty's Fleet (and their "technical staff" were:

1. The "Steam Manual"<sup>61</sup> containing *regulations and instructions relating to the machinery of His Majesty's Ships* and
2. the "Stokers' Manual"<sup>62</sup> for:
  - a) Engine room *Ratings not entitled to the Steam Manual*, and
  - b) Seamen under training in mechanical and stoke-hold work.
  - c)

The importance of these two books is that *they lay down the basis for the engineering department of the Navy to be able to supervise*

A. *the construction and commissioning of, and*

B. *the subsequent in-service inspection, maintenance and operation of*

*ALL of H.M Naval & Aerial ships and their machinery..*

To most, this may seem irrelevant, however the methods of construction, inspection, testing and acceptance for any one of H.M Air Ships of the day (inclusive of Rigid, Semi-Rigid, Non rigid Aerostats and also boat hulled Aerodynes) followed exactly the same process as any other ship, no matter the medium (water or aether) they floated upon.

## Notes on "Civil Aviation"

Admiralty Rigid Air-Ship construction process:

1. The assorted parts of the hull were laid out and built in sheds beside the construction bay.
2. The bulkheads of the ship, primary "Transverse Frames" were assembled flat, on a building jig - for an airship these were circular.
3. Once completed, the frame was lifted off the jig and another frame assembled on the jig.
4. The frames would then be assembled on a "Tower" and longitudinals and false frames added, these "Bays" would then be removed from the tower and placed on rotating cradles while final bracing and adjusting was accomplished.
5. As the multiple bays were completed, they would be lined up and additional intermediate frames and longitudinals added to connect them all together.
6. Once the skeleton of the hull was completed, it was "'Hung from the roof of the Shed" (hence the term Hangar) using block and tackle while the gas-bags were installed and inflated, the outer skin laced on and the tail assy, control cabin and engine cars - all assembled separately - were then attached.
7. A "Lift and Trim" test was performed with the air-ship still in the shed. During this test the vessel was allowed to float freely using its' own buoyancy but restrained using lines attached to "weights and balances" in order to determine her waterline trim.
8. Adjustments were made using weights hung about the structure - where necessary - to ensure the ship would ascend or hover in a neutral position using buoyancy alone.
9. Upon completion of the "Weight and Balance" test, the engines were tested with the ship tethered in order to ensure they functioned and could be properly operated.
10. Having successfully passed these two tests, the vessel was taken from the construction facility "Into the Field" where inclination tests to determine correct rigging and installation ( i.e to make sure nothing came loose) were accomplished.
11. The final testing was flight testing, which originally consisted of about 4 hours in the air but was steadily increased until, for R-38, the requirement was 150 hours or more including sustained full speed, bad weather etc.
12. Having passed all of the construction testing for acceptance, the vessel was then passed-off to the Admiralty and commissioned - just like any other "Naval Vessel". A Navy crew was assigned to the Air-Ship and took responsibility for her as a weapon of war. In this respect, the Royal Navy's "Air Service" truly was the British Fleet's "Air Arm", and the Navy's "Engineers" were now required to understand, operate, repair and maintain all of her equipment under Admiralty regulations proscribed in the "Steam Manual". While the Navy no longer "Sailed" the seas, and reciprocating steam engines had given way to "Steam Turbines" the principle behind understanding what was going on remained - and still remains, the same.

Prior to WW1 the British Empire, like many nations, had 2 "Arms" or military forces - a Naval Arm (Navy) and an Land Arm (Army), both of which used "Aerial Machines" in different ways. The "Forces of the day" believed that "aeroplanes were for Observation and Co-ordination" however fixed wing aeroplanes with limited range and their inherent susceptibility to corrosion were not a menace at sea, the Air-ship with long range and the ability to ascend above the range of guns - was. Src - British rigid air-ship pg 5 .

### SECTION NOTES:

**CANADIAN AVIATION - 1913**

1913, Montrose Airfield is the first operational base built for training of pilots for the RFC, the first of its kind in Britain. RFC flying training schools experience frequent crashes as they build up a force of skilled pilots.

06 August 1913 : Victoria, British Columbia, Canada first fatal airplane accident in Canada occurred when American barnstormer, John M. "Johnny" Bryant, California aviator is killed flying his personal Curtiss Bi-plane seaplane. In the morning he flew from the Willows to Cadboro Bay and landed on the beach there. He had the wheels removed and replaced with seaplane floats, making his next flight the first seaplane flown on the waters of British Columbia -Taking off into gusty conditions he tested the planes water landing ability by landing at the mouth of the bay, then took off and headed to Victoria. As he approached, there were 20,000 anxious fans scanning the skies. When they spotted the little airplane they broke into wild cheers - That evening, about 5:30, Johnny took off from the harbor for another flight over the city. After circling the harbor he flew to the business section of Victoria. After flying at about 800 feet over the city for 5 minutes, he began a steep dive. The dive continued, faster and steeper until he was 200' over the city, then onlookers saw the right wing collapse. He crashed into the roof of the Lee Dye Building and was killed instantly. Detective Heather, Motor Constable Foster, and Constable McLellan were watching in the crowd. - His wife Alys McKey (married May 29 1913) learned to fly and also trained as a mechanic by Spring of 1913 she is reported to have become an expert pilot, with a reputation for being a "daring flyer!" - Bennett Aero Company - Before going into Canada, she set an altitude record for women of 2,900 ft above the ground. On July 21st, she became the first woman to pilot an airplane in Canada, at Minoru Park, Lulu Island, British Columbia. Alys and Johnny were welcomed into Canada by an excited crowd, anxious to see them both. At the time Johnny was hailed as one of the most outstanding exhibition pilots, and they had never seen a female pilot, let alone one who would perform 'stunts' in the air! Alys had been watching the performance from the Department of Marine Building. The accident plunged her, and all of Victoria, into grief. She never flew again. John Bryant was "one of the best airmen" of that era and had done "a great deal of exhibition flying" prior to coming to Canada.

1913 : The Daily Mail (UK) offers £10,000 for the first "Trans-Atlantic" flight. UK War Office contracts Handley Page to build 5 aircraft to win the prize. Handley Page designs the L.200 to win the prize.

17 April 1913 : Desmond Lucius Studdert P. P. Arthur joins No. 2 Squadron RFC, Montrose Scotland.

27 May 1913 : Right wing of Lieutenant Desmond Arthur's B.E.2 biplane (ser. no. 205) collapses without warning at 2500 feet over Montrose during a routine training flight from Upper Dysart to Lunan Bay.

1. Not wearing a seat-belt, Lieutenant Arthur is thrown from the aircraft .
2. Killed instantly, Lieutenant Arthur was found 160 yards away from the wreckage of his machine.
3. Lieutenant Arthur's death in an accident was one of the first to occur in the Royal Flying Corps
4. Lieutenant Arthur's death was the first at Montrose.
5. Lieutenant Arthur's death was the first in Scotland
6. Lieutenant Arthur's was the first Irishman to die in an air-accident.

21 June 1913: the Accidents and Investigation Committee of the Royal Aero Club found that the accident causing Lieutenant Arthur's death had occurred because of the incompetent repair of a broken spar by an unknown mechanic. It was believed that the damage to the aircraft had been accidental, and shoddily repaired to prevent detection prior to the aircraft being transferred from Farnborough to Montrose.

11 July 1913 : government inquiry opened into Lieutenant Arthur's death.

1913 : Royal Navy commissions seaplane carrier "Hermes".

1913 : Royal Navy begins building a chain of coastal air stations around Britain.

February 1913 : The Admiralty Purchases Aircraft at the Aero Show. The Admiralty, under Winston Churchill made several purchases at the Aero Show including a Short seaplane, one Avro and two Bristol tractor biplanes, a Vickers pusher biplane, Sopwith-Saunders flying boat and two Sopwith three-seater tractor biplanes.

March 13, 1913: Trenchard Wins British Pilot Brevet. The Royal Aero Club granted Major Hugh Trenchard (1873-1956) his brevet on 13 March 1913 (pilot's certificate No.270).

April 15, 1913 : 1st Schneider Trophy. M. Jacques Schneider presented a trophy for competition amongst pilots of seaplanes. The first contest which took place on 15 April, was won for France by M. Prevost flying a Deperdussin (160hp Gnome).

## Notes on "Civil Aviation"

August 7, 1913 : Cody's new biplane design collapses in the air above Laffan's Plain - killing the pilot - Cody.

September 1913 : UK Military Aviation Control Transfer. The control of military aviation is transferred from the Master-General of Ordnance to a new 'Department of Military Aeronautics' in command was Director-General, General D Henderson.

1900-1914 : Before the war "air-worthiness" did not exist as a distinct branch of aeronautics.

1913 : flying prohibited within five miles of Charing Cross - no steps were taken to "ensure safety in flight".

1914 - 1918 : During the war the seeds of "air-worthiness" were sown by the military (Service) branches using "Air-Craft"

1914 - 1918 : British Royal Navy Admiralty and Royal Army War Office departments assigned the duty for formulation of equipment & munitions specifications evolve the concept of "Air-Worthy" for aircraft as weapons of war.

1914 - 1919 : "Air-worthiness" concept means considerably more than the modern concept.

1914 -1919 : "Air-worthiness" means that aircraft design calculations were carried out by the Service department concerned.

1914 -1919 : From drawing board concept to end product, Aircraft Construction was inspected by Government officials.

End 1913 : Airship (research / design / construction?) transferred from Royal Aircraft Factory (Raf) to the Royal Navy. Admiralty "heavier than air "craft contracts being awarded to Messrs A V Roe, Short Brothers and Sopwith.

End 1913 : Royal Aircraft Factory (Raf) now devoted to research and invention of "heavier than air "craft for the RFC.

### Aircraft Production, Acceptance and Repair :

On the outbreak of the war, Napier and Rolls Royce were contracted by the Air Dept. of the Royal Navy (RNAS) to build high horsepower water-cooled aero-engines (250 HP R.a.f 3). The Royal Aircraft Factory technical experts provided as much data as possible as well as copies of the then existing drawings. Napier adhered to the R.a.f design, but Henry Royce had other ideas and started from scratch. This marked the beginning of a long line of Rolls Royce engines for use in aircraft and it was thought essential that their names should have generic continuity.

The names of birds of prey were thought suitable with the first RR military aero-engined "Eagle".

### The Royal Aircraft Factory:

Technical department for Royal Army and Royal Navy air-craft research and design services.

manufactured aeroplanes and aero-engines.

repaired aeroplanes and aero-engines.

provided spare parts for aeroplanes and aero-engines.

The Admiralty made comparatively little use of Raf air-craft research and design services

The Admiralty developed an independent technical branch for air-craft research and design.

on the outbreak of war, the Royal Aircraft Factory was entirely under the control of the Director-General of Military Aeronautics.

For the first two years of war much pioneer work in design, both of aeroplanes and engines was carried out at the Royal Aircraft Factory.

December 1913 : The Aeronautical Inspection Department (AID) is for the purpose of inspecting aircraft and other supplies for the Royal Flying Corps (RFC).

The department was immediately organised into two main technical branches dealing with the inspection of aeroplanes and engines respectively, each under the control of an Inspector.

The headquarters of the department were temporarily established in a private house - "Ashdean, - Alexandra Road, Farnborough Common" for receipt of machines delivered by private contractors for erection and final flight tests as laid down in their contracts.

At that date the establishment staff totalled 28.

The scope of the inspection carried out by AID in 1913 comprises not only aircraft but supplies of many other kinds utilized by the Flying Service, such as balloons, hangars, tents, machine tools, raw materials, fabrics and a variety of general equipment. In the

## Notes on "Civil Aviation"

inspection of these multifarious supplies almost every trade was dealt with, and some idea may be formed of the department's technical requirements when it is realized that "detailed inspection" was made not only of all materials, but also of the manufacturing process to which they were subjected, of the assembly of various parts into component units and of the erection / assembly of the aircraft, engines, etc.

The Headquarters organisation was divided into sections, each containing officers specialising in its particular branch of engineering or science. The external organisation was on a geographical basis, the country being divided into districts each under the control of a district officer responsible for the entire conduct of inspection throughout his territory.

**ROYAL ENGINEER TRAINING - 1914**

The training of the "Signal Service" is not included in the Royal Engineer Training Manual, except as regards the depot training of recruits.

PEACE TRAINING:- The object of training.

1. The immediate object of all training is the preparation of the officer, the man and the unit for the duties which will be required of them in war, and this object must be kept in view in every detail of the instruction.
2. " The full power of an army can be exerted only when all its parts act in close combination."f Engineers assist the other arms by applying the special training which they receive according to the requirements of the military situation. The training of engineers is therefore of a two-fold nature. They must be trained in their technical duties, and their general military knowledge must be so developed that they can apply their technical knowledge effectively. A proper balance must be maintained between these two requirements.

**INDIVIDUAL TRAINING**

4. The recruit officer.

1. The training of the officer may be considered under two headings :

—

- i. General military training,
- ii. Special technical training.

These two portions of his training are of equal importance, the one being complementary of the other.

2. The recruit officer's course at the School of Military Engineering is designed to develop his military instincts and to lay the groundwork of his technical training.

It will therefore include :

—

- i. The course of general military duties and training laid down for recruit sappers (Sec. 5).
- ii. General theoretical instruction in the tactics of all arms,
- iii. Practical instruction in elementary infantry tactics as laid down in " Infantry Training."
- iv. Fortification, including field engineering,
- v. Construction,
- vi. Survey and reconnaissance,
- vii. Electricity,
- viii. Workshops.
3. The recruit officer must be taught from the first that engineers exist only for the assistance of the principal fighting arms in certain technical matters, in which cavalry, artillery, and infantry are not required to have the special knowledge and skill of engineers.

5. The recruit sapper and pioneer.

1. The training of recruits should begin immediately they join, and should be carried out under carefully chosen officers and non-commissioned officers. The course for the recruit may be considered under the following headings :

—

- i. The test of trade,
- ii. Military duties and training.

## Notes on "Civil Aviation"

- iii. Musketry,
- iv. Field works.

The whole course will occupy about 29# weeks.

2. On joining, all dismounted recruit sappers will be tested at their trade in accordance with " Royal Engineers—Corps Memoranda."

The recruit mounted sapper.

1. The recruits' course for mounted sappers will include ;—

- i. The test of trade,
- ii. Military duties and training,
- iii. Musketry,
- iv. Field works.

2. The trade test will be carried out in accordance with " Royal Engineers—Corps Memoranda " as soon as the recruit joins.

The recruit driver (where R.E Air Branch recruit Pilots were placed) .

1. The recruit driver's course will include—

- i. The development of a soldierly spirit,
- ii. Squad drill, with and without arms. (See " Infantry Training.")
- iii. Physical training,
- iv. Instruction in routine duties, cleanliness, smartness, orders, and the necessary regulations.
- v. The care of arms, visual training, and ranging,
- vi. Riding drill,
- vii. Driving drill.
- viii. Recruits' course of musketry.
- ix. Swimming.
- x. Hygiene.

### CANADIAN AVIATION - 1914

1914 : The popular reaction to the outbreak of World War One can be seen as evidence that the schools had done little to train critical faculties.

The patriotic curriculum delivered exactly what was required of them, wave upon wave of volunteers for the armed services.

In 1914, Britain was alone of the major protagonists to not require Conscription. So many volunteers heeded Kitchener's Call to Arms that it could be put off until 1916.

Even then, it was largely due to the efficiency of the Killing Fields in France that more manpower was required.

25-30 August 1914 : "National markings" applied to Royal Flying Corps aircraft, when Union Jacks were painted on the under surface of lower wings .

October 1914 : the British adopt the concentric circular "target" introduced by the French, but the colours were reversed .

[the "RCAF roundel" with a maple leaf as the central device was only authorized during the Second World War, but did not appear as standard nationality marking for Canadian aircraft until after the war ended.]

1914 : Not only the fighting aeroplanes, but the general equipment of the air-fleet, will play a part in the aerial battles of the future.

1. The organisation of a squadron of machines for war-in-the-air is found to be "surprisingly intricate", and little is known.
2. There must be trained mechanics in large numbers,

## Notes on "Civil Aviation"

3. The trained mechanics must be driven from place to place in motors, according to the movements of the aeroplanes they serve.
4. Then the aeroplanes, if necessary, must be dis-assembled, packed on lorries and taken across country by road
5. there must be portable sheds [hangars] upon the landing grounds, in which the aeroplanes may be housed at night.
6. There also needs to be:
  1. A supply of spare aeroplanes, and
  2. A supply of spare parts, and
  3. A number of travelling workshops with skilled engineers,which can be rushed from place to place for the repair of damaged aeroplanes.

A sketch of one of the "workshops on wheels", *which are vital to the organisation* of the RFC, is illustrated below <sup>63</sup>

1914 : Britain and her Dominions maintained but three soldiers out of every 2,600 of the population; Germany, on the other hand, maintained 26 out of every 2,600 of her population. August, 1914, the British Army consisted of 250,000 Regulars and 200,000 Reservists. Britain had also a force of 250,000 Territorials (partly trained volunteers). With this force of 700,000 she had to guard the Homeland and India. 1914- ROYAL NAVAL AIR SERVICE OFFICERS a MEN = 800. ROYAL FLYING CORPS OFFICERS & MEN 100

a pilot has confidence

in the machine he flies. He knows it is strong as a whole ; that it has no hidden weakness or faulty spar ; that he may rely upon it implicitly, even under the acutest strain.

The building of an aeroplane is a problem of great difficulty such a problem, in fact, as no other designers of craft, either for land or sea, are called upon to face.

The machine must be immensely strong, and yet it is essential that it should be light. Its planes cannot bear through the air more than a certain number of pounds per square foot ; and so if it is to be a practical craft, and raise a useful load, every pound that can be saved

---

<sup>63</sup> THE AEROPLANE BY CLAUDE GRAHAME-WHITE AND HARRY HARPER

## Notes on "Civil Aviation"

in its construction has a definite value. It is because such work is so intricate that there is special interest in a visit to an aeroplane factory. Here, in large, well lighted workrooms, are skilled craftsmen employed. Some of the men, now risen to be foremen of their departments, made their first acquaintance with aviation in the very early days. Then there were no factories, and an inventor, regarded invariably as a "crank," found a mechanic who was intelligent to help him, and built his craft humbly in some outhouse or shed. Now these handy mechanics, who perhaps forsook a post in a motor works to join some "scheme" (Programme) to build an aeroplane, find themselves in positions of trust in a large and flourishing factory turning out aircraft for Governments and for private use, and with a staff of workers under their control. Source: The Aeroplane - Graem White 1914

Put together scientifically and from sections of wood specially tested, a remarkable strength may be obtained by such a method of building. When the wings of a machine are ready and have been sheathed with their fabric, and when its hull and chassis have been built, it finds its way into the assembling shop. The motor is bolted in its framework, the propeller fitted, and the whole construction receives a final overhaul. And then one morning it is wheeled out upon the aerodrome its planes spotless and gleaming in the sun and is tested for the first time in flight. In many cases, so great has been the progress in aeroplane building, that a new machine will do just what its designer intended it should; there is no longer any doubt as to the craft's ability to take the air. But minor adjustments have usually to be made, none the less, before a machine is delivered to its purchaser; and in the case of a war machine, bought, say, for the Admiralty or the Army, it needs to perform prior to being taken over a series of special tests. It must show that it can ascend rapidly and fly at a certain

## Notes on "Civil Aviation"

speed, and it must raise a specified weight of fuel, in addition to that of its pilot and passenger. The War Office has prepared a list of its requirements for military machines of different types ; and aeroplane builders, if they plan craft for Government acceptance, must be prepared to submit them to the trials arranged. A light scouting machine, when it is tested, must be able to lift its pilot and fuel sufficient for a flight of 300 miles, and it needs to vary its speed from 30 to 85 miles an hour. Larger machines, built for scouting, have to carry the weight of a pilot and observer and 80 lbs. of wireless apparatus ; while a craft to be used in fighting must raise in addition to its crew the weight of a gun and ammunition ; this is estimated to represent 300 lbs. What the maker usually does, when a craft intended for the Government has been built and given a preliminary testing, is to send it by way of the air either to Farnborough, where the Royal Aircraft Factory is situated, or to Eastchurch, in the Isle of Sheppey, where the Royal Naval Air Service has its headquarters

January 2, 1914 : UK War Office - Army Orders announce the formation of the Aeronautical Inspection Department (AID) - RFC under the command of Major JDB Fulton as a result of accidents involving Deperdussin biplanes, Cody biplanes, and Bristol monoplanes in 1912 & 1913. New aeroplanes and engines were delivered by road to Royal Aircraft Factory - Farnborough for erection and flight test prior to acceptance by the AID. A vital factor involving the department was in assuring "increased security" in the air. "Standards of safety" for air-craft were laid down by the AID and soon adopted by private industry. The AID imposed stringent standards which greatly reduced the number of casualties amongst pilots and air-men.

The United Kingdom War Office - Ministry of Munitions, long responsible for control of precise gauging of rifle / gun bores, ammunition and similar articles issued to H.M Forces, mandates the AID laboratories to:

1. Ensure aeronautical items manufactured / purchased / used by H.M Forces are engineered to be interchangeable,
  2. Ensure aeronautical items manufactured / purchased / used by H.M Forces are of a suitable safety standard,
  3. Undertake material development for specification of aeronautical items manufactured / purchased / used by H.M Forces
  4. Conduct raw materials - testing : wood, wire and fabric, steels, alloys, etc..
- C. Conduct testing of engine:
- A. component parts
  - B. gauges
  - C. accessories
  - D. fittings
  - E. electrical equipment
- D. Conduct testing of airframe:
- A. component parts
  - B. gauges
  - C. accessories
  - D. fittings
  - E. electrical equipment

## Notes on "Civil Aviation"

### E. Metallurgy development:

1. High strength steels in cast and wrought forms,
2. stainless steels in cast and wrought forms,
3. light-weight alloys in cast and wrought forms,

### F. Identify problems with the inspection of these myriad items and develop inspection and testing techniques to ensure compliance with standards developed for the Ministry Munitions.

11 April 1914 : Aircraft Park. S. Farnborough.—Repair work on aircraft and mechanical transport was carried out in the workshops, and the technical training of recruits was continued. Source : ROYAL FLYING CORPS (MILITARY WING). WAR OFFICE summary of work for week ending April 11th, 1914

18 April 1914 : A Belgian Fatality : While making a first trial flight on a new biplane at the St. Jo aerodrome, near Antwerp, on the 8th, the Belgian pilot, Francois Verschaeve, fell from a height of about 1,000 metres, and was instantly killed. It is believed that a part of the wing-warping mechanism failed

Double Fatality in Germany : While flying at the Kaditz aerodrome at Dresden, on the 10th, something went wrong with one of the wings of a machine piloted by Hermann Reichelt, and it fell from a height of 500 metres. The passenger, Fraulein Steglitsch, was thrown from the machine and killed instantly, while the pilot was so severely injured that he died in hospital a few hours later. It may be recalled that last autumn Reichelt made a flight from Berlin to Paris.

An Italian Fatality. WHILE Lieut. V. Grifla was flying over the Mirafiori Aerodrome at Turin on the 31st ult., the machine side-slipped, and fell from a height of 40 metres. The unfortunate pilot was killed instantaneously.

April 20, 1914 : 2nd Schneider Trophy Contest. The second contest for the Schneider Trophy took place and was won for Britain by civilian pilot Howard Pixton flying a Sopwith Tabloid (100hp Gnome) fitted with floats. The trophy is intended to encourage design and development of seaplanes and flying boats

1 January 1914, No. 2 Squadron of the Royal Flying Corps moves from Upper Dysart to Broomfield Farm.

Test flying as a systematic activity started during the First World War, at the Royal Aircraft Establishment (RAE) in the United Kingdom. An "Experimental Flight" was formed at the Central Flying School. During the 1920s, test flying was further developed by the RAE in the UK, and by the National Advisory Committee for Aeronautics (NACA) in the United States. In the 1950s, NACA was transformed into the National Aeronautics and Space Administration, or NASA. During these years, as work was done into aircraft stability and handling qualities, test flying evolved towards a more qualitative scientific profession. In the 1950s, test pilots were being killed at the rate of about one a week.

1914 M.P. William Joynson-Hicks complained of a "whitewash" re Lieutenant Arthur Arthur's death and that the Secretary of State for War Colonel Seely would not admit to the faulty repair.

When you try to unravel how the "Great War" and Aviation Maintenance-Engineering started, it is actually somewhat of a mystery - not many people know the full details....

28 June 1914 : Sarajevo, Bosnia-Herzegovina, a teenage Serbian named Gavrilo Princip assassinates Archduke Franz Ferdinand, heir to the Austrian throne.

1 July 1914 : UK admiralty withdraws its aerial resources from the RFC. Royal Naval Air Service (RNAS) created.

What had changed from 1914?

In the summer of 1914, few Canadians would or could have been aware that the spark set off by Prinzip would be one of a number of events that would lead to massive losses of life over the next four years.

Canada was essentially a British Colony in 1914,  
Britain was tied to some very serious agreements with other nations, particularly France.

## Notes on "Civil Aviation"

Although "Britain had no formal alliance with either side, no one in Canada knew that she did have these informal military understandings with France, and they were to prove almost equally binding." (Source LCol D.J. Goodspeed, *The Armed Forces of Canada 1867-1967*, Directorate of History, Canadian Forces Headquarters, Ottawa, 1967, p. 29.)

June 1914 : RFC Splits in Two. The RFC was split in two during June 1914, when the Admiralty announced the formation of the Royal Naval Air Service (RNAS), consisting of the Air Department (Admiralty), the Central Air Office, the Royal Naval Flying School, and the Royal Naval Air Stations.

June 28, 1914 : Archduke Franz Ferdinand, heir to the throne of the Austro-Hungarian Empire is assassinated in Sarajevo, Bosnia.

23 July 1914, "Austria, supported by Germany, served a harsh ultimatum on Serbia

July 28, 1914 : Austria-Hungary declares war on Serbia

28 July 1914 : Austria and Germany declared war.

30 July 1914 : Russia mobilizes to support Serbia.

01 August 1914 : Germany declares war on Russia

03 August 1914 : Germany declares war on France.

03 August 1914 : Italy supportive of Germany and Austria in a defensive war only, remains neutral.

04 August 1914, Britain declares war on Germany in defence of Belgium

04 August 1914 : Canada as part of the British Empire (there is no distinction) is now also at war with Germany.

May 1915 : Italy declares war on Germany and Austria.

(Source LCol D.J. Goodspeed, *The Armed Forces of Canada 1867-1967*, Directorate of History, Canadian Forces Headquarters, Ottawa, 1967, p. 29.)

Basically, a couple of disparate groups began to play the very ancient and unfortunate game of "you fight me, you fight my gang." As Europe rushed to arms, Britain mobilized its fleet. Germany invaded Belgium, whose neutrality had been guaranteed by Britain as well as Germany, and on 04 August 1914, Britain declared war on Germany. In 1914, when Britain was at war, Canada was also at war; and there was no distinction, although Canadians believed at the time that Britain's cause (in defence of Belgium) was just. Most however, genuinely believed that the war would be over before they could take part in it.<sup>64</sup> (Source LCol D.J. Goodspeed, *The Armed Forces of Canada 1867-1967*, Directorate of History, Canadian Forces Headquarters, Ottawa, 1967, p. 29.)

July 1914 : USA : "SAFE AND SANE" MACHINES FOR ARMY AND NAVY.

The first Burgess- Dunne machine has been shipped to the United States Navy from the Burgess works at Marhlehhead and the one for the Army will be delivered within a few weeks. This Government will be the first to own one of these inherently stable machines and its undoubted success in the Army and the Navy will be watched with interest by all.

The Burgess-Dunne seaplane was recently converted into a land machine and a number of flights made with it on the old Squantum field near Boston. Flight after flight was made by Mr. Webster running over the field and leaving the ground without any guidance whatsoever, the controls being locked. It climbs well over 300 feet per minute and its balance in the air is quite as good as with the boat attachments which were transferred back onto the machine in just an hour and forty minutes, when the machine was flown to Marhlehhead, a distance of 18 miles, in ten minutes—naturally with a strong wind. ( AERONAUTICS, July 31, 1914)

July 1914 : USA : "WHAT AMERICAN AVIATION NEEDS" :

Support by the public.

Support by the Government.

Federal control of flying. (For years urged by AERONAUTICS.)

Endowed aeronautical laboratories.

Aeronautical engineering courses in technical colleges.

Scientific construction methods.

Improved motors.

---

## Notes on "Civil Aviation"

Before the Committee on Military Affairs last fall Colonel Reber said "Congress has not appreciated the importance of or given adequate support to military aviation. On the other hand, the great nations of Europe have realized its importance and France has led the world in its utilization.

Aviation has appealed more strongly to the imagination and esprit of the French people than to the rest of the world. This nation, seeing an opportunity of increasing its military strength over that of its neighbors, who have not been so prompt to realize the utility of aviation, raised large sums of money by popular subscription for the purchase of aviation material for the army and public opinion has forced the government to support and develop the fourth arm of the French army.

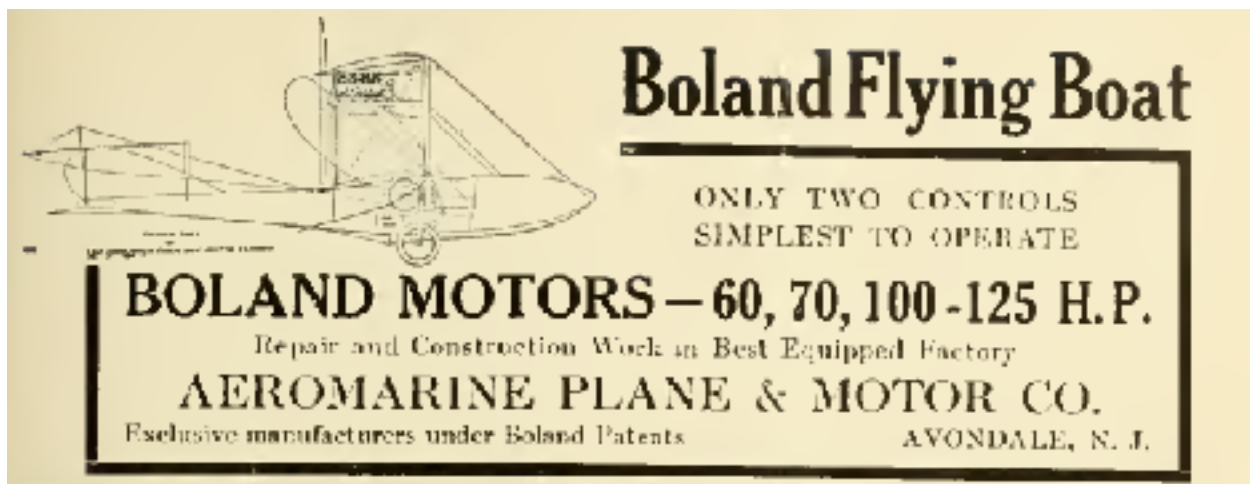

The French and English governments have for the past two years given direct support and encouragement to manufacturers by money awards at military trials, and subsequent orders for the machines winning in the trials. "Experience, experiment and application of engineering principles have advanced the construction of the aeroplane far beyond the pioneer machines of our chief inventors.

Judging, however, from the large number of freak machines that are to be seen in the hangars around our aerodromes, there is no general realization that the correct design of an aeroplane calls for a new branch of engineering—aeronautical engineering—which embraces physics, mechanical engineering, meteorology and even marine engineering and naval architecture.

It is to be hoped that the day will soon come when the carpenter shop or backyard will no longer serve as a factory nor the would-be constructor obtain his plans from an octavo volume on 'How to Build an Aeroplane,\* or from the pages of an aeronautical journal. The number of imitators of successful designs is great, but the really competent designer is a 'rara avis' in this country." (AERONAUTICS, July 31, 1914)

July 1914 : England : BRITISH LABORATORY REPORT : The technical report for 1912-13, the fourth of the series, of the British Advisory Committee on Aeronautics has just been published. The report summarizes the work undertaken, and detailed particulars are given. The investigations cover general questions in aerodynamics, experiments on wind channels, including description of the new 4-ft. wind channel at the National Physical Laboratory ; experiments on models of wings, bodies, etc. ; models of complete aeroplanes; stability, efficiency of propellers, strength of construction; hydro-aeroplanes and design of their floats; fabrics, researches on alloys, etc. The volume contains over 400 pp.. with many plates, and is published by Wyman & Sons, Fetter Lane, London, E. C.; price, US \$2.43. (AERONAUTICS, July 31, 1914)

July 1914 : Sets of detailed working drawings for the Latest type of the MORANE-SAULNIER are offered for sale at US \$200. Sale exclusive. The Morane-Saulnier holds the best records for cross-country and speed flying. The "Owner" of the drawings can superintend construction of the aircraft. Address A. F., care of : AERONAUTICS, 250 W. 54th St., New York.

## Notes on "Civil Aviation"

03 August 1914 : Paris, France : French aviator, Roland Garros drives his aeroplane headfirst into a German air-ship which ignited and burned, killing himself and the 25 man crew of the air-ship. ( AERONAUTICS - AERONAUTICS PRESS INC. 250 West 54th Street New York Telephone, Columbus 8721 Cable, Aeronautics, New York July 31, 1914. pg 22 ERNEST L. Jones - Editor)

04 August 1914: British Empire's Declaration of War with Germany.

04 August 1914 : Paris: German army aeroplane reported to have dropped three bombs on the garrison town of Luneville, killing fifteen persons. Three German dirigibles reported maneuvering over Brussels. Numerous aeroplanes from French aviation centers said to be flying over Paris in flotillas of twos, threes and fives toward Germany. German dirigible supposed to have dropped explosive on a French town, annihilating a patrol of troops. ( AERONAUTICS, July 31, 1914. pg 22)

06 August 1914 : Brussels : German aeroplane and Zeppelin dirigible reported destroyed by Belgians. A personal conflict is reported between a Belgian and a German aviator who fired revolvers at each other and then vol-planed (glided) to the earth.

There are no less than 105 airships, from the "vedette" type to the "monster Zeppelin" reported under construction by the belligerent nations ( AERONAUTICS, July 31, 1914. pg 22)

On the outbreak of war, a detachment of the RNAS was sent to Belgium and airship and seaplane patrols were instituted between the East Coast of England and the Belgian coast. All available pilots and aircraft of the RFC proceeded to France with the British Expeditionary Force.

All available pilots and aircraft of the RFC proceeded to Farnborough. Here the squadrons were made up to full strength with aeroplanes and transport from many sources including the CFS, before moving to the embarkation points. RFC squadron aircraft types on strength at the outbreak of WWI was as follows:

No. 2 Squadron - BE 2

No. 3 Squadron - Bleriot's & Henri Farman's

No. 4 Squadron - BE 2

No. 5 Squadron - Avro, Henri Farman and BE 8's

August 8, 1914 : The first 'Defence of the Realm Act [DORA] passed by UK Parliament.

15 August 1914 : "aeroplanes seem to be fulfilling the promises made for them by military experts" . Zeppelins will do remains to be seen as they have evidently been kept under cover thus far for some definite purpose. "A scouting aeroplane carries two officers, one as pilot, the other as observer. The officer observer carries a photographic apparatus, and in many cases remarkably clear pictures of the enemy's positions have been secured from dangerously low altitudes. French aerial scouts have taken amazing risks in this respect, 1 flying well within the range of hostile rifles in order to insure accurate observations. Generally speaking, German officers engaged in similar work have flown at greater altitudes. Successful as the aeroplane has been for reconnoitering, its value as an instrument of destruction has proved practically nil. Judging from the experience of this campaign, the use of aeroplanes will be limited to scouting, and not be extended to actively offensive operations. This applies, at any rate, to the aeroplane in its present form. In many cases German military aviators have endeavored to disguise themselves as Frenchmen, sometimes by displaying a conspicuous tricolor of France on their machine." Franco-German miscellaneous cables tell of the frontier being patrolled by rival aeroplanes within easy sight of each other, of a Zeppelin having zipped over Liege during the bombardment, pursued by a Belgian aviator who lost his life in destroying it, after which the Germans confining their activity here to aeroplanes for scouting, several being destroyed by shots from the forts; of a French aviator reconnoitering the Germans from Belfort and returning with valuable information, the machine riddled with holes; of a report from St. Petersburg telling of the destruction of a German Parseval non-rigid entailing the loss of four; of a German dirigible sailing over Liege and dropping several bombs in the city, killing 17 civilians and firing several buildings, with two Belgian aviators in fruitless pursuit; of bombs dropped on the railway station at Nainur, Belgium and on a bridge, without great damage. A Zeppelin dirigible is reported hit and destroyed by Belgian gunners, using an explosive shell. A Zeppelin dirigible is reported hit and destroyed by Belgian gunners, using an explosive shell. Many German aeroplanes sighted along the border and French aviators flying across the line quickly pursued by overwhelming numbers of German "planes and driven back. One German aviator is reported to have flown over the Vosges mountains and dropped bombs in Vesoul, the capital of a department of France, returning safely. Two Belgian aeroplanes give chase to a German aeroplane scout who was flying above the Belgian fortified position on the Meuse, the result being hidden by the darkness. Two German aeroplanes follow a French aviator and shoot at him unsuccessfully. Servians are said to be using aeroplanes to reconnoiter Austrian operations. Two German aviators were fatally hit and the third seriously wounded, while their machines were wrecked. The German airmen were reconnoitering the Belgian trenches at Diest. Small bombs dropped from aeroplanes seem to do little damage. Many of these reports are printed again days later with changes. No authentic information is available. France is reported to have acquired a German aeroplane factory by the capture of Mulhausen. French reports say a German aviator was brought down by hitting the motor and made a prisoner of the

## Notes on "Civil Aviation"

pilot and observer. Pistol duel in mid-air between French and German aviators with no results reported. German aviators drop bombs in the department of the Meuse but injure no one. A French family receives a letter telling of the destruction of a Zeppelin by bombs from a French aeroplane flying above it. Russians are reported to have brought down a German aeroplane with four aboard, all being killed. An airship, supposedly German, was seen over the North Sea from Amsterdam, Holland. Two German aviators killed and one seriously wounded by Belgians is the report on the German reconnaissance of the Belgian lines. "The guns that were especially designed to destroy aeroplanes have more than fulfilled their mission and the marksmanship of the Belgians has been wonderful. On the other hand the Krupp aero guns used by the Germans have all but proved useless. They were used against the Belgians at Liege, but in nearly every instance it developed that their range was too limited for them to do any real damage.

### AEROPLANES ARE CONTRABAND

Great Britain's contraband of war proclamation places arms, ammunition and all distinctly military supplies on the list of "absolute" contraband. "Aeroplanes, airships, balloons and aircraft of all kinds and their component parts, together with accessories and articles recognizable for use in connection with balloons and aircraft are among contraband material."

GOODYEAR BALLOON LANDS IN ONTARIO : The Goodyear balloon that left Akron August 1 at 10 p. m., in charge of Pilot R. A. D. Preston, who won the national balloon race, and carrying Williard Seiberling, son of F. A. Seiberling, president of the Goodyear Tire and Rubber Co., and W. D. Burns, landed east of Chatam, Ontario, early Sunday morning. source - AERONAUTICS

August 28, 1914 : 2nd DORA - The second Bill of the Defence of the Realm Act is laid before Parliament in order to extend these powers to include control over armament factories and their workers.

September 1914 : RNAS Becomes Responsible for UK Home Defence. At the request of the Secretary of War (Lord Kitchener), the First Lord of the Admiralty was invited to become responsible for home defence against enemy aircraft.

16 September 1914 : Canadian Aviation Corps is formed. It consists of two officers and one mechanic, none are Pilots. One Burgess-Dunne aircraft is purchased by the Canadian Aviation Corps and shipped to England.

September 1914 : The Curtiss Model "J" and Model "J-2" tractor biplanes have been developed to meet the 1914 specifications of the United States Army, and several of the Model "J" have already been adopted and are in use by the Signal Corps at San Diego, after demonstrations by Raymund V. Morris. These models can be furnished as land machines or as hydro-aeroplanes.

#### MODEL "J," RECONNAISSANCE TYPE.

Model "J" tractor is arranged for pilot and observer, seated in tandem, and is equipped with double controls, so that either man may take charge. With Curtiss Model O-X 90-100 h.p. motor, it has an extreme flying range of from 40 to 90 miles per hour, carrying two men and four hours' fuel. Flying light, Lieut. Goodier climbed 1,000 ft. in 1 minute; fully loaded, its guaranteed climbing speed is 2,000 ft. in 6 minutes.

#### MODEL "J-2," FAST SCOUT TYPE.

Model "J-2" Curtiss tractor is a single-seated speed scout, as fast a biplane of its horse power as ever has been produced, but still substantial enough to stand up well under the stress of hard service. With Model O-X Curtiss motor, the "J-2" tractor has more of a range. The wings of both these models are of latest approved section, one piece type. Wing frames are built up carefully of ash and spruce, with beams shaped and grooved by hand, important joints copper strapped, the whole securely stayed with piano wire. Covers are of unbleached linen, thoroughly coated with our own water and oil-proof preparation. Model "J" wings have a spread of 40 ft. 2 in. for the upper surfaces, and 30 ft. for the lower surfaces; the area of lifting surface is approximately 350 sq. ft. Model "J-2" wings have a span of 24 ft., upper and lower alike, and an approximate area of 240 sq. ft. The fuselage is of rectangular section, 26 in. wide by 35 in. high at the cockpit, tapering to nothing at the rudder. The longerons are ash strips, 1 1/2 in. in

## Notes on "Civil Aviation"

diameter, tapering to 1 in. The fuselage is corner braced with nine sets of struts, which are joined with corner clamps without piercing the longerons. Each section is crosswired in three directions.

The third and fourth vertical struts are placed so as to act as wing struts, and they have extensions running to the upper surface. The streamline effect is preserved throughout by enclosing the front of the fuselage, with motor and mountings, in a cowl of Duralumin, slotted to admit air to the motor. Streamline cowls protect the cockpits and deflect the wind from the pilots, as well as shield from the weather the dashboards on which the instruments are mounted. Behind the cockpits the fuselage is covered with waterproofed linen. The Curtiss Model O-X motor is mounted on engine beds of laminated ash and spruce 2 in. x 3 in. in diameter. It is fastened in front to a plate of 3-32 in. steel, which joins the longerons, and also carries the radiator. The rear ends of the engine beds are mounted on a hardwood cross member framed into the second pair of vertical struts of extra size. The fuselage is supported by an undercarriage consisting of three supporting struts on each side, borne on two streamlined wire wheels. The tires are 26 in. x 5 in. Wheels are attached with rubber band shock absorbers.

Protection from an upset in case of an unusually hard landing is afforded by two white oak skids, 6 ft. long, turned up in front; they also help shield the propeller. The tail skid is of white oak and sprung with rubber bands. Turn-up ailerons 10 ft. in length live 2 ft. wide are attached to the trailing edge of the upper surface on Model "J" tractor. Model "J-2" has turn-up ailerons on both upper and lower surfaces. These are 7 ft. long by 2 ft. wide. The vertical rudder has an area of 30 in. x 36 in., is well secured to the stern post, and is double wired. Horizontal rudders, or flippers, have an area of 16 sq. ft. Either the Curtiss system of control, consisting of shoulder yoke and steering wheel, or the Deperdussin system, with foot bar, can be provided with these models. General dimensions are: Model "J"—Span, lower plane, 30 ft.; upper, 40 ft. 2 in.; chord, 60 in.; ailerons (2), 10 x 2 ft.; length over all, 26 ft. 4 in.; rudder area, 16 sq. ft.; flippers, 16 sq. ft.; area fixed tail surfaces, 30 sq. ft.; number passengers, 2; fuel capacity, 4 hours; speed range, loaded, 45-75 m.p.h.; climbing speed, 400 ft. p.m.; price f. o. b. Hammondsport, \$7,500; hydroplane equipment, extra, \$500. Model "J-2"—Span—Lower plane, 30 ft.; upper, 24 ft.; chord, 60 in.; ailerons (4), 7x2 ft.; length over all, 24 ft.; rudder area, 16 sq. ft.; flippers, 16 sq. ft.; area fixed tail surfaces, 30 sq. ft.; number passengers, 1; fuel capacity, 3 hours; speed range, loaded, 45-50 m.p.h.; climbing speed, 500 ft. p.m.; price f. o. b. Hammondsport, \$7,500; hydroplane equipment, extra, \$500.

30 September 1914 : USA : ENGLAND PAYS FOR USE OF WRIGHT PATENT.

The Aero Club of America has been notified that the British Government has officially recognized the Wright Brothers' patent and has paid to the British Wright Company \$75,000 in settlement for the past, present and future use of the Wright patent in Great Britain. This still leaves the patent in the possession of the British Wright Company, which can collect royalties from other users of the invention in England. This is in settlement of the sued claim for \$375,000 which has been in the British courts for the past year. (Aeronautics 30 Sept 1914 )

04 August 1914 : Canada is at war with Germany. Canadian Minister of Militia and Defence, Sam Hughes. By 1916, Hughes is in at "Caesar's Camp" Bedfordshire, England in charge of Canadians training in the pouring rain and mud.

04 August 1914 : Officer Commanding the Military Wing of the Royal Army (RFC) is tasked with creation of new squadrons. Initially a target of 12, Lord Kitchener increases this to 60.

## Notes on "Civil Aviation"

August 1914 : Malcolm McBean Bell-Irving of Vancouver pay his own way to Britain. Joins RFC, gazetted "lieutenant" in September 1914.

August 1914 : RFC recruiting - Canada

1. Officers of Canada were seconded to the RFC.
2. Enlisted men were discharged from Canadian Militia and then "re-enlisted" in the RFC under British Terms.
3. All WW1 RFC enlistees were classified as "Air Mechanics" (A.M's) and unless they earned the rank of corporal or higher - air mechanics they remained in name - even if cooks, drivers or actual mechanics.
4. Persons joining the mechanical branch RFC were allowed to chose their desired work but had to undergo trade tests at the Toronto armouries
5. British RFC experts who determined the trade suitability of the recruit. (source We are the Dead pg 206, By Larry Gray)

In formulating his ideas for aircraft technical training in the peacetime RAF, Trenchard inherited long tradition of boys service dating back long before the First World War, both in the Royal Navy and in the Army. Rapid expansion of the Royal Flying Corps during the war had generated a shortage of skilled mechanics, **47 of whom were needed to support one front-line aircraft**. In the early stages of the war the stream of volunteers entering the Army was combed for the skilled men needed to maintain the RFC's aeroplanes .

However, it was quickly realised that the fledgling air army would have to train its own mechanics if the acute shortage was to be overcome Prior to the outbreak of war, the technical training of men was carried out at the Central Flying School, Netheravon and with the growing demand for specialist skills, a number of additional schools were established. Whilst Netheravon held 200 trainees, a school at Reading held 1,000 and, from July 1916, a converted jam factory at nearby Coley Park held 2,000.

There was no basic engineering course for semiskilled recruits and 400 men were therefore sent to polytechnic schools for training. This kind of improvisation could not provide the men the RFC needed and rationalisation of the training machine became an urgent need. (Source ref : **TRENCHARD'S BRATS BLOW OUT** By Gp Capt W J Taylor OBE RAF DD Spt Pol 2 (RAF))

August 1914 : Royal (State owned) ordnance factories provide the British Army with about a third of its weapons

### **Aircraft Production, Aircraft Acceptance and Aircraft Repair :**

With airships being transferred to the Navy at the end of 1913, the Royal Aircraft Factory (RAF) from that time was devoted to research and invention of heavier than air aircraft for the Royal Flying Corps.

The Navy had pinned its faith to the civilian aircraft industry, with Admiralty contracts being awarded to Messrs A V Roe, Short Brothers and Sopwith.

Furthermore, on the outbreak of war, Rolls Royce were also encouraged to build high horsepower aero-engines. This marked the beginning of a long line of Rolls Royce engines for use in aircraft and it was thought essential that their s should have generic continuity.

The names of birds of prey were thought suitable with the first RR military aero-engined "Eagle".

The Royal Aircraft Factory existed as a technical department for both services, but the Admiralty made comparatively little use of its services and developed an independent technical branch. Thus, on the outbreak of war, the Royal Aircraft Factory was entirely under the control of the Director-General of Military Aeronautics. For the first two years of war much pioneer work in design, both of aeroplanes and engines was carried out at the factory.

## Notes on "Civil Aviation"

A certain amount of manufacture was also done, including repair and the provision of spares for both aeroplanes and aero-engines. As a result of accidents involving Deperdussin, Cody biplanes and Bristol monoplanes during 1913, the Army Orders issued on 2 January 1914, announced the formation of the Aeronautical Inspection Department of the Military Wing, RFC. New aeroplanes and engines for acceptance by the AID, were to be delivered by road to Farnborough for erection and flight test. Furthermore, a vital factor involving the department was in assuring increased security in the air. Standards of safety were laid down by the AID, which were soon to be adopted by private industry and greatly reduced the number of casualties amongst pilots.

In January 1915, a "scheme" (Programme) of co-operative aircraft construction was established in Scotland with G & J Weir as the central firm. This system utilised a number of small sub-contractors for the manufacture of aeroplane parts in conjunction with final assembly of the component parts in their own works. By the summer of 1915, similar centres to that operating in Scotland had been set up in Coventry, Manchester and London. From March 1915, demand and output of new aircraft and engines increased, contractors were now required to deliver new machines for acceptance by the RFC either to aerodromes built adjacent to their own works, or to the nearest specified aerodrome. This was instead of the previous method of supplying new aircraft to Farnborough for acceptance. Under the new system, aeroplanes were erected by the firm's own staff and handed over for flight test by the pilots of the Aeronautical Inspection Department. This eventually led to the establishment of a number of Aeroplane Acceptance Parks (AAPs).

By late 1918, 27 AAPs were either in operation, or under construction. Also a number of Aircraft Repair Depots (ARDs) were established geographically to carry out major repairs to military aircraft. Good road and rail communication and proximity to industrial centres were all essential for the operation of the ARDs. Construction commenced from 1917 on new sites that were established close to an existing railway network and from this extensive railway sidings were created serving large salvage and store sheds.

A network of Decauville narrow gauge railways was also built inside the camp serving the interior of salvage, workshops and stores

### **National Aircraft Factories :**

In the middle of 1917, the sudden expansion of the aircraft programme, led to a change from the previous policy of distributing work among a large number of small producers, to concentrate instead on large production centres. Sir William Weir (the Director of Munitions in Scotland) originally proposed the transfer to the Ministry of Munitions, of the responsibility in supplying aircraft to the Army and Navy in May 1916. On 8 September 1916 Mr. Montagu (Minister of Munitions) laid Weir's proposal before the War Committee, that great skill was required to manufacture aircraft components and the production of aircraft should therefore be controlled by the Ministry - the War Committee accepted. Meanwhile a change of Government took place and the "scheme" (Programme) was accepted by Lloyd George's War Cabinet in January 1917. Weir was then appointed as Controller of Aeronautical Supplies, and his duties were to re-organise the existing Army and Navy supply sections into a single Supply Department. Weir was given a seat on the Air Board and an office in the Hotel Cecil, where the Board had its headquarters. Percy Martin became Controller of Petrol Engine Supply. On 21 February 1917, Weir's achievement as Controller of Aeronautical Supplies was awarded with a knighthood. With the new Minister's backing (Christopher Addison), Weir curtailed the designing of aircraft and aero-engines by the State at the Royal Aircraft Factory. Weir's main policy was to get new aircraft into the air while producing fewer aircraft types produced in larger factories. On the 1 March 1917, there were 55 types of aircraft in production and 33 types of engine. One year later, the number of aircraft types in production had come down to 30 and of engines, to 25. At the same time the Department had been trying to develop large production facilities rather than to spread the work among a large number of contractors.

Sanction was therefore obtained in September 1917 to fund the setting up at Government expense, of three new factories, to be operated under the control of the Department of Aircraft Production. Sites were selected at Croydon, Liverpool and Kingston, and arrangements were made for their management by Holland, Hannen and Cubitt (Croydon), the Cunard Steamship Company (Liverpool) and the Sopwith Aviation Company Ltd. It was eventually decided that the Sopwith Aviation Company should adapt the new building at Kingston (built by Dick Kerr) as an assembly shop to their adjacent factory and not as a national factory. A factory under construction in the autumn of 1917 belonging to the Crossley Motors Ltd Company, was selected instead as the third National Aircraft Factory "NAF's"

### **NAF 1 Waddon - Croydon**

Construction started: September 1917 until 13 July 1918.

Contractor: Holland, Hannen & Cubitt Ltd.

Opened: January 1918 (office staff) March 1918 (production).

Area: 198 acres.

Management: Holland, Hannen & Cubitt Ltd.

Products: 3,000 CC type interrupter gears and 241 DH. 9 aircraft.

September 1917, Holland, Hannen & Cubitt undertook the management of their factory at Waddon.

## Notes on "Civil Aviation"

The site consisted of 198 acres of flat land, but progress on construction was delayed by the bad weather and the shortage of steelwork.

By 18 January 1918, the office staff was installed and by the middle of March, part of the factory was sufficiently equipped for manufacture to begin. All building work being completed by 13 July 1918.

The factory was laid out to produce a weekly output of forty, DH 9 aircraft plus spare parts, and 600 CC interrupter gears.

The first complete aircraft was delivered during the first week of April and the total production by 31 March 1919, was 241 aircraft and 3,000 CC interrupter gears.

### NAF 2

NAF 2 Heaton Chapel - Stockport Construction started: 9 October 1917. Contractor: Unit Construction Co. Ltd and H Matthews & Sons (Builders) Ltd. Opened: April 1918. Area: 22 acres. Management: Crossley Motors Ltd. Products: Dragonfly aero-engines, 326 aircraft of the DH. 9 and DH.10 types.

Matthews & Sons started construction of the NAF at Heaton Chapel and its adjacent landing ground, on 9 October 1917 on a site covering 22 acres, but was delayed by extensive excavation required on the site.

Matthews also experienced delays in the supply of steelwork and other building materials and it was not until December, that the company were granted first-class priority for building supplies.

In July 1918, the factory was extended for the manufacture of Dragonfly engines.

Manufacture began in April of DH 9 and DH 10 aeroplanes and the total output before 31 March 1919, was 326 aeroplanes - making it the most successful National Aircraft Factory.

### NAF 3

NAF 3 Aintree - Liverpool Construction started: 4 October 1917. Contractor: Trollop and Colls Ltd. Opened: March 1918. Area: 70 acres (Stag Farm). Management: Cunard Steamship Company Ltd. Products: 126 off Bristol F2b Fighter aircraft. Notes: built next to Aintree racecourse.

About 70 acres of land next to Aintree racecourse was requisitioned under DORA and construction on the new factory began on 4 October 1917.

The racecourse itself was used as a flying ground. About 3,000 men were engaged in construction work, many were Irish labourers who in March 1918 left the country owing to the new Registration Act.

By this time, the buildings had been sufficiently built to accommodate the office staff and production of Bristol Fighter aircraft commenced several weeks later.

By 1 October 1918, only 36 aircraft had been delivered and twelve of these were without engines.

Manufacture continued after the Armistice, with the total output at the end of March 1919, being 126 aircraft.

### Oldham

**Oldham Aircraft Factory Construction started: 1 March 1918 (on new buildings). Contractor: Trollope & Colls Ltd. Original function: cotton mills at Hollinwood (Gorse Mill No.2) and at Shaw (Lilac Mill). Opened: July 1918. Management: Alliance Aeroplane Company Ltd. Products: 10 off partially assembled Handley Page 0/400 aircraft.**

June 1917, an Aircraft Production Board had been set up in America and the Bolling Commission sailed for Europe to gain information for an American aircraft programme. The mission had recommended in July, for the production of Caproni bombers and later, that consideration should also be given to the Handley-Page bomber.

In London, the Chief of Air Staff, Hugh Trenchard, devised a plan in January 1918, for incorporating American crews as well as British, thus creating an inter-Allied bombing force using Handley Page 0/400 bombers.

Contracts were therefore awarded to the Standard Aircraft Company for 500 HP bombers, most of these were to be shipped over for final assembly in Britain.

The metal fittings for 1,000 sets of aircraft were to be manufactured by the Grand Rapids Airplane Company.

Later the order was increased to 2,000, 0/400 bombers and in September, the first American-built 0/400 was delivered to the American Air Service.

A site for the final assembly of American-built aircraft, was found in Oldham, where there was a large female workforce normally engaged in the Lancashire cotton industry.

On grounds of cost, and the labour question, it was decided to requisition the Gorse Mill (No. 2), Hollinwood, and the Lilac Mill at Shaw.

It was also decided to erect a number of buildings for aircraft assembly and to provide an Aircraft Acceptance Park. The work of construction began in February, and the Alliance Aeroplane Company (Waring and Gillow Ltd.) were appointed as managers.

Progress of construction was slow and it was not until July 1918 that the first floor of Gorse Mill was occupied.

## Notes on "Civil Aviation"

The first shipments of parts arrived on 20 August and by the November Armistice, only 10 aircraft had been partially assembled.

### Airframe Components

The production of large bomber aircraft towards the middle of 1917 raised a serious problem in the supply of radiators as this type of aircraft required water-cooled engines requiring radiators of special construction.

The factory of the Motor Radiator Manufacturing Company at Greet, near Birmingham, offered several advantages for this purpose. It was already laid out for the production of tube honeycomb radiators and had the necessary plant equipment.

After negotiations to transfer the company, which belonged to a Norwegian, to an English firm, it was taken over by the Ministry under DORA.

Perhaps the most significant war-time contribution made by this company was in February 1918, when the new SE 5 aircraft then under trial had a serious reduction in top speed.

This was due to the fitting of a similar radiator to that used on the DH. 9 but when fitted to the SE 5, it produced too much drag.

Within two days a new design was despatched to Farnborough which proved successful.

As this aircraft type was urgently required at the Front, a number of courier air mechanics personally delivered the new radiators to service aircraft in France.

The demand for aircraft timber in September 1917, resulted in the provision of facilities for kiln-drying British ash timber.

Two new kilns were constructed at the works of the Great Western Railway Company at Swindon and those of the London Brighton and South Coast Railway at Lancing.

Both companies took over the kilns for their own purposes on 31 March 1919

### Aero-Engine Components

During August 1917, heavy demands for Rolls Royce aero-engines were received by the Controller of Aeronautical Supplies, special steps therefore, had to be taken to increase production.

Because of their experience in repairing French aero-engines, the firm of Clement Talbot at Ladbroke Grove was selected by the Government for repair and producing spares for Rolls Royce engines.

The works were taken over by the Ministry on 1 January 1918 and dealt with the repair of RR engines returned from aerodromes within the counties around London.

The total output of repaired engines during the period of the works running as a national factory was 608.

The works returned to Clement Talbot on 28 February 1919.

During January 1917, in order to undertake a large contract for the supply of aero-engine parts, the Government authorised Mitchell, Shaw and Company, to purchase the Goss Printing Works at Hayes, Middlesex.

The Ministry of Munitions decided in October 1917, to take over the management of the factory, as the output was unsatisfactory.

After the change in management, the organisation improved and production increased.

The factory was sold in September 1919 to the Cosmos Consolidated Company.

### National Balloon Factory - Finchley - Church End (London)

end 1917 demand for kite balloons for the Home Defence - anti-submarine programme.

The decision was taken therefore, to establish a "National" Balloon factory.

site was found in Finchley, North London,

A Cinema, the property of Bohemia Ltd.

The premises were taken over under the Defence of the Realm Act

managed jointly by the Sidney Davidson Balloon Company and Davidson Aviation Company,

owing to some delay in setting this up,

the factory was taken over in July 1918 by the Controller of National Aircraft Factories.

Production of Caquot and Nurse type balloons began in April 1918,

total number of balloons was 118.

297 employees, 270 were female.

closed on 8 February 1919

sold around June 1919 to the Kiwi Polish Company.

**sixteen firms tendering for War Office munitions contracts:**

## Notes on "Civil Aviation"

1. WG Armstrong Whitworth & Co. Ltd.
2. Harper Sons & Bean Ltd.
3. William Beardmore & Company
4. Head Wrightson & Co.
5. Cammell Laird & Company
6. Kings Norton Metal Co.
7. Coventry Ordnance Works
8. The Projectile Co. (1902) Ltd.
9. Dick Kerr & Company
10. Rees Roturbo Manufacturing Co.
11. The Electric & Ordnance Accessories Co.
12. Vickers Ltd.
13. T Firth & Sons
14. J & P Hill
15. Hadfields Ltd.
16. Watson Laidlaw & Co.

August 1914 : UK, barely 1000 men constitute the entire British aircraft industry - disparagingly referred to as "the Trade" by the Navy, Army and the Government. <sup>65</sup>. There exist a number of civilian aircraft manufacturing firms, Nine are well known:

1. A.V Roe & Co. Ltd.
2. Sopwith Aviation Co. Ltd.
3. Handley Page Ltd.
4. The British and Colonial Aeroplane Co. Ltd ("Bristols")
5. Grahame-White Aviation Co. Ltd
6. Blackburn Aeroplane and Motor Co. Ltd
7. Aircraft Manufacturing Co. Ltd.
8. Martin & Handasyde Ltd.
9. Short Bros. Ltd

In addition to the "well known's" there are also:

1. J.Samuel White Ltd.
2. S.E Saunders Ltd
3. Hewlett & Blondeau Ltd
4. White & Thompson Co. Ltd.
5. H.J Mulliner Ltd.
6. **Pemberton Billing Ltd.**
7. Bleriot (UK) Ltd. (British Bleriot)
8. British Caudron Co. Ltd.
9. numerous "Foreign Licensees"

Additionally, civilian owned *armaments companies* manufacturing aircraft are:

1. Vickers Ltd.
2. Coventry Ordnance Works Ltd.

August 1914 : Dominion of Canada - Order-in-Council passed under the War Measures Act bans all flying in Canada except with militia permission.

1. Canadian Militia headquarters (Sam Hughes?) sends message to regional headquarters and major police forces: "Arrangements are being made for an aviator named E.L. Janney to fly into Canada from the United States; and I am to request, should he come your way, that you offer him no hindrance."
2. Commissioner of the Dominion Police, A.P. Sherwood, replies: "If Mr. Janney does not run into any trouble up above, I do not think he will be interfered with below."

---

<sup>65</sup> Harald Penrose, *British Aviation - The Great War and Armistice 1915 - 1919*, Putnam & Co., London 1969. pg. SBN 370-00128-1

## Notes on "Civil Aviation"

25 August 1914 : Minister of militia and defence, Canada (Sam Hughes) cables British minister of war (Lord Kitchener) to ask if the services of aviators were required.

31 August 1914 : Kitchener replies: "six expert aviators could be taken at once and perhaps more later." To date, 4 Canadians had gained "Aero Club of America" certificates. <sup>66</sup> Canada supplying pilots to Britain at this time was a "non event". <sup>67</sup>

04 August 1914 : The RNAS possesses 71 aircraft (40 landplanes and 31 seaplanes) of 33 different types made by 13 manufacturers. The aircraft have 18 different engine types supplied by 6 engine manufacturers.

18 different engine types built by 6 engine manufacturers:

1. Anzani;
2. Austro-Daimler;
3. Gnome;
4. Mercedes;
5. Renault;
6. Salmson (Canton-Unne).

13 different makes of landplanes falling under two flavours

A. Biplanes, comprising types:

1. Avro,
2. B.E.2,
3. Bristol,
4. Caudron,
5. DFW,
6. Henri Farman,
7. Maurice Farman,
8. R.E.5,
9. Shorts,
10. Sopwith.
  - A. The "Baby", commonly called a "Schneider" due to common ancestry, differed from the Schneider by way of an "open Horseshoe" cowling and 110 hp Clerget.
11. Vickers.

B. Monoplane, comprising types:

1. Bleriot;
2. Deperdussin.

**The seaplanes will be dealt with in a later chapter.**

By the end of 1914 the "war needs" of naval aviation had gone far to curtail the multiplicity of types seen at the outset.

December 1914 : The principal landplanes flying were:

1. Avro,
2. Bristol,
3. Henri Farman,
4. Maurice Farman,
5. Grahame-White Box-Kite,
6. Morane-Saulnier and
7. Sopwith Tabloid.

When mobilization was ordered, four squadrons of the RFC attempt to standardize their flying equipment before proceeding overseas to France.

No. 2 Squadron equipped to go to France.

No. 3 Squadron equipped to go to France.

No. 4 Squadron equipped to go to France.

No. 5 Squadron equipped to go to France.

<sup>66</sup> <https://legionmagazine.com/en/2004/07/a-high-flyer-indeed/#sthash.TvoKVHoh.dpuf>

<sup>67</sup> <https://legionmagazine.com/en/2004/07/a-high-flyer-indeed/#sthash.TvoKVHoh.dpuf>

## Notes on "Civil Aviation"

But the mixed collection of types and the small numbers of aeroplanes owned by the RFC enabled this to be done only in 3 instances:

No. 2 Squadron - equipped with the B.E.2

No. 4 Squadron - equipped with the B.E.2,

An "Aircraft Park" (repair depot) equipped with spares:

- 1) 4 each Sopwith Tabloids fitted with 80 horsepower Gnome engines
- 2) 3 each B.E.8's fitted with 80 horsepower Gnome engines
- 3) 3 each Henri Farman aeroplanes fitted with 80 horsepower Gnome engines
- 4) 9 each B.E.2's fitted with 70 horse-power Renault engines
- 5) 1 each B.E.2c's fitted with 70 horse-power Renault engines.

A detachment of No. 2 (Aeroplane) Company of the Royal Engineers' Air Battalion.

- 1) No. 1 Squadron - equipped with "air-ships".
- 2) No. 2 Squadron - equipped with fixed wing aeroplanes
- 3) No. 3 Squadron - equipped with fixed wing aeroplanes,

16 September 1914 : Minister of Militia and Defence - Colonel Sir Samuel Hughes, authorises the "adventurer" Ernst Lloyd "Tony" Janney of Galt, Ontario to:

1. buy an airplane,
2. form the Canadian Aviation Corps (CAC) and
3. accompany the First Canadian Division to England. <sup>68</sup>

The two other members of the CAC were:

1. Lieutenant William Frederick Norman Sharpe of Prescott, Ontario, one of the 4 Canadians certified as a pilot by the Aero Club of America;
2. Harry Arthur Farr from Victoria British Columbia, infantry unit, as mechanic, to be promoted to Staff Sergeant. (possibly came from from **30th Regiment, British Columbia Horse**. 1914 saw the formation of the Victoria Independent Squadron, December 1914 many volunteers from the regiment joined the newly formed 2nd Regiment Canadian Mounted Rifles)

1. in Marblehead, Mass.? , Ernest Lloyd Janney bought an airplane for \$5000.
2. Ernest Lloyd Janney selected a Burgess-Dunne biplane, a "design so stable that it could almost be flown "hands off."
3. Burgess-Dunne two-seat tailless swept-wing pusher floatplane
4. Burgess-Dunne biplane designed by British aeronautical pioneer Lieutenant J.W. Dunne
5. Burgess-Dunne built by American boat builder Stirling Burgess of Marblehead, Mass..
6. When Ernest Lloyd Janney appeared at the company office in September,
7. Janney insisted on near-instant delivery.
8. The aircraft Ernest Lloyd Janney wanted was a seaplane "demonstrator"
9. "demonstrator" needed an engine overhaul after many hours' running.
10. Burgess-Dunne employees did what they could, crate the machine, and ship it by rail to Isle La Motte, Vt.
11. At Isle La Motte, Vt., the Burgess-Dunne is reassembled. From Isle La Motte, Vt. the aircraft is flown to Quebec, Janney is a passenger.

18 September 1914 : Lieutenant-Colonel A.J. Oliver commanding officer, 29th Regiment, (Galt, Ontario) composes a letter to assistant adjutant general, 1st Division (London, Ont.) in regards to "Janney":

*"It is the impression of a great many people here in Galt, to which city this party belongs, that absolutely **no reliance should be placed in him** in any way, shape or form and **his statements in connection with flying have always been taken as a joke**. He is a high flyer all right, but **the meaning of the term is entirely different from that normally applied to an aviator.**"* <sup>69</sup>

Lt.-Col. Oliver's letter was later sent to militia headquarters in Ottawa, a copy is held in the National Archives of Canada.

21 September 1914 : The Burgess-Dunn left Isle La Motte, Vt on the delivery flight:

1. with Burgess-Dunne pilot, Clifford Webster, at the controls.

---

<sup>68</sup> <https://legionmagazine.com/en/2015/06/canadian-flyers-go-to-war/#sthash.Nujhovay.dpuf>.

<sup>69</sup> <https://legionmagazine.com/en/2004/07/a-high-flyer-indeed/#sthash.TvoKVHoh.dpuf>

## Notes on "Civil Aviation"

2. Janney piloted the machine about one-quarter of the time.
3. The two stopped at Sorel, Que., for fuel - where he is arrested..
4. newspaper reports verify the arrest
5. Janney was arrested on landing at Sorel, Que. on suspicion of being a spy,
6. Janney was freed only after a telephone call to Hughes.
7. Government documents do not mention this arrest episode,
8. Burgess-Dunne pilot Webster did not mention the incident in a letter he wrote at the time.
9. En route to Quebec City, the engine packed up and Webster force-landed at Deschaillons, east of Trois-Rivières.
10. The Burgess-Dunne company sent a mechanic and parts to Canada.

29 September 1914 : the Burgess-Dunne arrived in Quebec (with troops at ?)

1. Burgess-Dunne is subsequently loaded aboard the SS Athenia, at anchor in the St. Lawrence river in Quebec.
2. *Janney telegraphed some auto mechanics in Galt, ordering them to report to him for services with the CAC.*
3. *auto mechanics asked if Janney had such authority to summon them in such a fashion. He did not.*

14 October 1914 : The Canadian Contingent arrives at Plymouth and is disembarked on the 15th. After arriving in England, the Canadian troops (?) were sent to the Camp (20 miles from) the Salisbury Plains for advanced training. before they entrained for Salisbury Plains a well-known place which had been used for the camping and drilling of British soldiers during many years

4. The CAC tags along to Salisbury Plain.
5. the Burgess-Dunne—damaged during the sea passage—was never repaired.
6. Ernest L. Janney spent the next several weeks travelling about Britain, learning what he could about aviation.

October 1914 : Canadian Camp - Salisbury Plains : a sense of irresponsibility amongst the officers. A correspondent of the Toronto Star of Nov. 27th, said to be a member of the Salisbury Staff, put it this way: "The man who makes a good officer is he who realizes that his place means more work, harder work than the private does who digs trenches. Men spend their entire lives at learning the game. But the majority of the 1500 officers at Valcartier did not seem to understand. They were enthusiastic, but it was misapplied, this enthusiasm. And so, Imperial officers shrug their shoulders and say that annihilation would overtake the majority of the troops should they go to the front under the officers who now nominally lead them."

06 Nov 1914 : Ernest L. Janney presents Major-General / Lieutenant-General Sir Edwin A.H. Alderson, the general officer commanding the Canadian Contingent, with a proposal "for a real air corps", recommending a "unit" with:

- A. 4 operational aeroplanes, 4 spare aeroplanes
- B. seven officers,
- C. seven sergeants and
- D. 32 mechanics.
- E. Ernest Lloyd "Tony" Janney had calculated how much motor (10 trucks) and horse-drawn (5 horses) transport it would need, how much oil and gasoline it would consume, and the cost for one year, which amounted to \$116,679.25;
- F. no suggestions as to how the "unit" would be used;
- G. None of the CAC personnel had ever been properly gazetted as members of the CEF,
- H. None of the CAC personnel had ever been properly attested as members of the CEF,

16 November 1914 : British war expenditures stated to be about 1,000,000 a day. src Mr. Asquith in parliament ?

18 November 1914 : Astonished, Alderson cables Ottawa, Department of Militia and Defence, for direction re "Two individuals" (Janney and Sharpe):

- 1) have accompanied the Canadian Headquarters from Canada claiming to be "aviators authorized by (the) minister";
- 2) Who claim to be "authorized in Militia **Order 463**" (the order posting officers to the CEF);
- 3) Please cable authorisation instructions as to:
  - a. their pay status;
  - b. Janey's request re: Large expense necessary to organize an efficient unit of 1 flight

November 1914 : Capt Janney draws an advance from the paymaster and sets off to tour England, allegedly in search of a suitable site for the CAC aerodrome (reportedly in Scotland)

## Notes on "Civil Aviation"

An incident of this period was the disposition of unattached officers within the Canadian Contingent. There were about 150 of them due partly to changes in organization, partly to the individual desire to obtain a chance of some kind, partly to not fitting in very well with War conditions. Three options were given them:

- (1) Commissions in the new Kitchener Army,
- (2) Commissions in the British Territorial Forces,
- (3) a chance in the 2nd Canadian Contingent.

A number obtained commissions (Including privates promoted from the ranks 200 Canadians were given commissions in these months.) the others returned to Canada in December under command of Lieut.-Col. C. D. McPherson. SRC - Canadian Annual review 1914.

15 January 1915 : Under General Orders issued in Canada, 62 officers are stricken off the strength of the Canadian Expeditionary Force:

- 6 Lt.-Cols'
- 7 Majors
- 1 Hon. Maj
- 18 Captains
- 30 Lieutenants

Many reasons were given by these officers for their return including:-

1. the small pay of British officers,
2. the desirability of private means in the British Army,
3. the absence of democracy in military life.

A different batch of 38 men were returned to Canada, without option in the matter, and arrived at Halifax on Dec. 11th.

19-20 November 1914 : Department of Militia and Defence, Ottawa response:

1. Janney and Sharpe sent with CEF on understanding they would join RFC.
2. Department of Militia and Defence has "NO INTENTION TO ORGANISE AN FLIGHT UNIT"....

One may ask, what had happened to "the CAC" as authorized by Hughes?

Had the minister forgotten it?

Had the minister given up on it?

Had the minister intended that Janney, Sharpe and Farr should be among the pilots that Kitchener had said he could use?

17 December 1914 : Ernest L. Janney cabled another proposal to Alderson.

1. Ernest L. Janney claimed to have bought "a beautiful Biplane of Military type"
2. which Ernest L. Janney was shipping to Canada.
3. Ernest L. Janney intended to barnstorm across the nation, even in winter, raising money by public subscription for a Canadian air squadron.
4. However, there is no evidence Ernest L. Janney had bought the plane (and brought it to Canada ... ) there is evidence however, (and lots of it) that Janney was a thief who bilked people out of their money as a result of it!

30 November 1914 : A Canadian aviation corps is being organized at Salisbury Plain, and will be attached to the Canadian army when it leaves for the front. Negotiations have been in progress between Canada and the British War Office for some time, and it has now been decided to form a squadron of twelve aeroplanes. The squadron will be in command of Captain Janney of Galt, Ontario, an experienced aviator. Captain Janney flew from Massachusetts to Valcartier camp to join the first contingent. There are two other Canadian aviators, M. Sharpe and Harry A. Farr. For the remaining posts there are no less than 469 applicants among Canadian soldiers at Salisbury Plain who want to join the aviation corps.

The British type of flying machine which has proved so successful along the fighting line in France and Belgium, has been adopted, and orders for the building of twelve have been placed, it is understood, by the Canadian government in England. The Canadian airmen will likely train, according to news received at Ottawa, at Montrose, Scotland, which is one of the British aviation centres" ("Aviation Corps Being Organized at Salisbury," The Globe (1844-1936), Toronto, Ontario, Tuesday, December 1, 1914, pg. 9, col. 1.)

01 December 1914 : Ernest L. Janney was declared AWOL by CEF authorities,

1. how could CEF discipline the man when there was no paperwork confirming his membership in the force?
2. there were no documents bestowing a commission upon him.
3. Ernest L. Janney was permitted to resign his commission.

## Notes on "Civil Aviation"

January 1915 : Ernest L. Janney sails for Canada and new ventures.

Lieutenant W.F.N. Sharpe - had taken flying lessons before the war,  
Lieutenant W.F.N. Sharpe sent first to a private British flying school,  
Lieutenant W.F.N. Sharpe then to France where he attended schools near Paris and Lyon.  
03 February 1915 : Lieutenant W.F.N. Sharpe gazetted a lieutenant in the RFC.

1915 : Shoreham, one new trainee pilot wrote home complaining "I've had no flying as we've had so many crashes lately that we've practically run out of machines!" This is borne out by the same pilot's report that there were only three aeroplanes available at one stage, one of them was an old Avro, an ex. school machine that was very difficult to fly but once mastered was said to "*enable one to fly anything straight off!*" In fact this lack of machines and instructors, too many pupils and weather so awful during the early months that many would be trainee pilots gave up waiting and opted to return to the army regiments from whence they had come. There was a six-week basic tuition period requiring a minimum of three hours dual flying and three solo which was short enough in itself but this was not always met – some trainees at Shoreham received as little as 90 minutes instruction (one had only thirty minutes) before their first solo flight which all contributed heavily to the number of accidents, fatal and otherwise at this time. Hitherto there had only been one flying fatality at Shoreham – there were eight from 1915 to 1919

04 February 1915 : Lieutenant W.F.N. Sharpe dies in a flying accident at Shoreham. takes off for his first solo flight as a pilot of No 3 (Reserve) Squadron, Royal Flying Corps. dies when his "Maurice Farman" ME.7 Longhorn or ME.11 Shorthorn ? side-slipped and crashed

04 February 1915 : Lieutenant W.F.N. Sharpe is the first Canadian casualty of the Air war.

May 1915 : Staff Sergeant H.A. Farr discharged from CAC.

February 1917 : Staff Sergeant H.A. Farr joins the RFC? - never flew in combat. or: Farr joined the Royal Naval Air Service (RNAS), ending the war with a Distinguished Service Cross and a Distinguished Flying Cross. unable to find a record of this.

May 1915 'in consequence of the Canadian Flying Corps being disbanded.' From that time on, until the end of 1916, military service entry for anyone who wished to be an aviator was controlled by individuals in Ottawa who, in addition to their other duties, acted for this purpose on behalf of the RFC and the RNAS. A total of 22,811 Canadians served and 1,563 gave their lives.

February 1915 : The Canadian Contingent left Salisbury Plain.

May 1915 : Canadian authorities were told that a "flying machine" valued at about £1,000, had been left behind in England. Searches began to locate it, but nobody told those looking exactly what type of airplane they were seeking.

June 1915 : Investigation into missing CAC flying machine in UK concludes rusty parts and 2 inner tubes were all that could be found.

June 1915 : Janney back in Canada, claiming rank of captain.

03 February 1915 : the Halifax Morning Chronicle, under the headline "Canadian Air Man Returns From The Front," featured a story with some outrageous statements.

- A. Ernest L. Janney claimed he had flown with the French army against Moroccan rebels.
- B. Ernest L. Janney description of the Burgess-Dunne delivery from Massachusetts suggests a direct five-hour flight at altitudes up to 23,000 feet.
- C. Ernest L. Janney described artillery observation flights in France, with shells whistling by his machine.
- D. Ernest L. Janney comments about the CAC omitted all references to Sharpe and Farr.
- E. Ernest L. Janney comments include new friend "Lieutenant" Bernard Hale who had accompanied him to Canada,
- F. Summaries of this interview appear in other Canadian newspapers.
- G. When Summaries of this interview appear in the British press several people who had known Ernest L. Janney write letters counteracting his account.

Bernard Hale had a British pilot's certificate, issued in May 1914, "Lieutenant" Bernard Hale held no military rank.  
Bernard Hale joined the Royal Naval Air Service in 1917.

When date? : Ernest L. Janney bought a second-hand Caudron in the U.S. and sought permission to operate a flying school near Toronto, in partnership with "Lieutenant" Bernard Hale.

## Notes on "Civil Aviation"

Militia authorities approved the school in April 1915, stressing this consent entailed no militia recognition or responsibility. Ernest L. Janney identifies himself as "Major" and "Officer Commanding, Canadian Flying Corps" when promoting the new school. Ernest L. Janney offers students a course costing \$500 : half up front, the balance on graduation. Both Ernest L. Janney and Bernard Hale seen wearing Canadian or British uniforms in relation to the school. Word of Janney and Hale wearing Canadian or British uniforms reaches the chief of the general staff. chief of the general staff issues memo: "Please clip the wings of Captain Ernest L. Janney and Lieutenant Bernard Hale." However, Canadian Militia officers unable to locate either man.

Janney Flying school vanishes in 1915 and Ernest L. Janney headed for the U.S.

1915 - 1917 : Ernest L. Janney in and out of newspaper and aviation magazine stories, none giving a full account of his actions.

1916 : Ernest L. Janney attached himself to a New Jersey State Naval Militia flying unit.

1917 : Ernest L. Janney organized the Janney Aircraft Company in Munroe, Mich., selling stock and building one plane.

23 March 1918 : Munro, Michigan newspaper article stated some of the plane's "machinery caught in the grass and the expected (trial) flight did not take place."

23 March 1918 : Munro, Michigan newspaper article states Janney was reported to be in California

2? March -April ? 1918 : San Francisco news articles note Janney charged with impersonating a Canadian officer.

May 1918 : Ernest L. Janney returns to Canada and tries, unsuccessfully, to secure a commission in the CEF.

Summer 1918 : Lieutenant-Colonel J.T. Cull of the Royal Air Force organises "Royal Naval Air Service - Canada" in response to German submarine operations in the Atlantic.

A. Janney ingratiated himself with Colonel Cull.

B. Colonel Cull arranged that Janney be commissioned as a sub-lieutenant in the Royal Canadian Naval Volunteer Reserve and assigned to RCNAS duties.

C. Militia officers wrote to Colonel Cull warning that Janney's previous record had been unsatisfactory.

D. Despite these reports, Colonel Cull retains Janney.

E. Janney's precise RCNAS duties are unclear.

F. RCNAS organisation suspended December 1918

G. Janney retained after the organizing of the RCNAS suspended.

H. Janney demobilized January 1919;

I. Colonel Cull tried to have Janney released in the rank of lieutenant.

J. Colonel Cull writes Janney complimentary letter. "I have nothing but praise for the capable and energetic way you have handled everything that was given you to do."

K. Colonel Cull acknowledged that he had received and investigated some adverse reports on Janney, yet he had found no foundation in them.

L. On at least two occasions, when the Department of National Defence was asked to describe Janney's military service, Colonel Cull's assessment was released - **rather than the original and more critical opinions of the Canadian army officers.**

October 1914 : RFC command structure overhauled. General Sir David Henderson made head of the RFC. Primary roles of the RFC: reconnaissance and artillery direction.

October 1914 : USA : NEW CURTISS MILITARY TRACTOR.

"Model N" is the latest military tractor from the Curtiss plant in Hammonds-Port, with a range of speed, with two people up and five hours' fuel, of from 40 to 75 miles an hour, climbing 4,000 ft. in 10 minutes, using a 100-h.p. O-X's motor, a refinement of the O-X 90-100-h.p. motor which is now standard in Curtiss machines.

October 1914 : M. I. T. COURSE OPENS.

**One of the 6 students** recently registered at the Massachusetts Institute of Technology is Captain V. E. Clark, of t'niontown. Pa., who has joined the institute for the benefit of the special post-graduate work on aerodynamics.

1. Captain V. E. Clark joined the institute for the benefit of the special post-graduate work on aerodynamics. :-

## Notes on "Civil Aviation"

1. is a graduate of Annapolis
2. has been transferred to the army, and
3. is attached to the Aviation Section of the Signal Corps.
4. has been at the flying school at San Diego for eight months and
5. has become skilled in the management of aeroplanes.

The ruSw course at Tech, which has been open only this term, is beginning auspiciously, according to Lieutenant Hunsaker, who has charge of the instruction.

Besides Captain Clark',

2. M. S. Chow (Chinese student) :-
  1. M. I. T. graduate in naval architecture, is
  2. making a study of aerodynamics leading to the degree Master of Science;
3. un-named Chinese student taking the work in their regular institute courses;
4. un-named Chinese student taking the work in their regular institute courses
5. un-named Chinese student taking the work in their regular institute courses
6. un-named (American ?) senior student in mechanical engineering is specializing in aerodynamics.

November 1914 : USA : ARMY WANTS AN **AIR ENGINEER**

The U. S. Civil Service Commission announces an open competitive examination for an "*aeronautical mechanical engineer*", i.e., a "M.E. who has specialized on aeronautical motors".

From the eligibles evolved by this exam :-

1. a vacancy at \$2400 a year will be filled in the Signal Corps Aviation School at San Diego, and
2. other vacancies as they occur in other branches of the service.

For the present this man will take up the motor end of Colonel Reker's experimental plant, while G. C. Loening will handle the aero-dynamical part of it.

Technical education will count 30 weights ;  
experience and fitness will count 70 weights.

Applicants must :-

- a) be graduates in mechanical engineering of some reputable school,
- b) be familiar with the theory and practice of engineering as applied to internal combustion motors and
- c) have practical experience in the design and testing of such machinery.

Additional credit given for experience in mechanical engineering as applied to aviation motors and machinery.

Other requirements are discreteness, moral fitness, et cetera.

Persons desiring to meet the requirements and desire this examination should at once apply for Form 1312, stating title of the examination for which the form is desired, to the U. S.. Civil Service Commission, Washington, D. C. Application must be filed with the Commission at Washington prior to close of business February 10. (Aeronautics Oct 1914 pg 116)

November 1914 : British Army eliminates post of "Officer Commanding - Military Wing", Hugh Trenchard is given the command of 1st Wing, made up of No. 2 and No.3 Squadrons.

November 1914 : RNAS Felixstowe takes delivery of Curtiss aeroplane # 950, an flying boat nicknamed the "America", one of 2 ordered by Murray Sueter at the request of Cdr. John Porte, British Admiralty, for "active" experimentation. Prior to the war, Porte designed "America" for Curtiss in order to win the 10,000 trans-atlantic prize offered by the daily mail.

Curtiss "America" specs (as delivered):

1. Wall-sided Fuselage, 5/8" planking (end-buttet) over a conventional fuselage longeron & strut framework with a flying boat fore-body shape. The butt joints of the planking being located at the step. No chines on the hull sides or planing bottom.
2. Strut and cable braced, 4 bay/ panel, Biplane wing plan with overhanging top span. Ailerons on the top wing - tips, sponsons on the lower wing, fences were subsequently added by Porte above the top wing at the outboard struts.
3. Model H-12s had 160 hp (118 kW) **Curtiss V-X-X** engines (later replaced by the RNAS with 2x 250 h.p Rolls-Royce engines)
4. Heavy aircraft, the hull was found insufficiently designed to take the stresses imparted during anything but calm water landings and assembled using poor methods of construction, the aircraft was found to have directional control as well as planning problems and also shipped water over the nose due to insufficient forward buoyancy

29 December 1914 : Malcolm McBean Bell-Irving reports to No. 1 Squadron RFC in France. wounded twice, had at least one flying accident, was twice mentioned in dispatches, and was awarded the Military Cross and the Distinguished Service Order. - See more at: <https://legionmagazine.com/en/2015/06/canadian-flyers-go-to-war/#sthash.Nujh0vay.dpuf>

## Notes on "Civil Aviation"

1914 : United States : Glen Curtiss refurbishes the Langley aerodrome, for the Smithsonian Institution as a means of trying to prove "prior art," i.e., to show that manned heavier-than-air flight had been possible before the introduction of the Wright invention.

1914 : United States : The U.S. Census Bureau lists 16 aircraft manufacturers with a combined total output of 49 aircraft. In 1914, as the world found itself on the brink of war, only 23 of the 3,700 airplanes in the world were U.S. owned. Recognizing the disadvantage at which this imbalance put the United States, a rider to the U.S. Naval Appropriations Act, 1915 establishes the National Advisory Committee for Aeronautics "to supervise and direct the scientific study of the problems of flight, with a view to their practical solution. Src reference : NASA SP-4216 Airborne Trailblazer, Two Decades With NASA Langley's 737 Flying Laboratory - Lane E. Wallace, NASA History Office 1994

Lieut. Col. F. H. Sykes, commandant of the British Royal Flying Corps, in his annual address at the Royal United Service Institution. London, reviewed the progress made in military aviation during the past year and summarized the information gained through experience. Principally he dealt with the factors of safety under the conditions of present aerial flight, and suggested changes in construction of advantage to military aviators. He advocated:

- the abandonment of flexible wings ,
- the universal adoption of flaps or ailerons;
- the use of more substantial landing gear;
- increased strength in design and construction;
- simplicity in design and construction;
- experimental work on better means of communication between aeroplane and aeroplane, and aeroplane and the ground ;
- the standardization of minor parts;
- the development of a larger type of machine.

On the subject of flexible wings Colonel Sykes said: "One cannot consider airworthiness without touching on the question of wing-warping as opposed to flaps. There is no doubt that the continual flicking about of the control lever during a long flight, caused by the self-warping of wings in a wind, has a very tiring effect on the pilot, and further, the warping wing requires more keeping in true than one fitted with flaps. The dismantling and general handling of wings fitted with flaps is, besides, easier, quicker, and less liable to mistake."

### THE AEROPLANE HAZARD.

The United States Compensation Inspection Rating Board has computed the aviation hazard of employees of aeroplane manufacturers and fixed the rate at 48.06 per cent of the payroll, with a minimum of \$1 000 per employee. The board's bulletin contains the following: "New Classification : To be inserted in manual "Aeroplane Manufacturers—Operation and demonstration, 48.60 per cent. Minimum premium \$1,000 for each employee engaged in operation and demonstration." This is the highest rate in the compensation rate manual.

30 December 1914 : USA : ARMY'S FIRST WAR 'PLANE.

The Burgess-Dunne (BD) **No. 3** was accepted by the United States Signal Corps Board after successful tests at San Diego, December 30, 1914. It is equipped with a 135 h.p., 9-cylinder Salmson motor. The machine developed a speed of 75 miles per hour with full load, consisting of two passengers, four hours of fuel. In this condition it climbed 350 feet a minute. This machine was built as an experimental type subject to further development. The wings are of the same dimensions as the original Burgess-Dunne aeroplane. See p. 83, March 31, 1914, Aeronautics. "The machine is inherently stable in the broadest meaning of the term. During the tests Mr. Webster allowed the machine to fly by itself for long periods, and demonstrated that it could not be stalled even with the levers pulled back and the motor suddenly shut off. It was not expected that this aeroplane would develop anything like the speed or climbing power shown in the tests and its success demonstrates beyond doubt that high efficiency may also be obtained in the inherently stable type of aeroplane. The machine is shown equipped with a Turner aviaphone and a Benet-Merciers rapid firing gun. Burgess supplied the Canadian contingent in the big war. Burgess has so built this type that its upper and lower wings by means of

hinged struts are capable of being folded one against the other. The flying wires remain at all times intact and the wing supporting wires alone need be cast off for disassembling. These features together with the entire absence of tail and tail surfaces make this

## Notes on "Civil Aviation"

aeroplane compact and easy to handle. Wing spread, 45 ft. ; length over all, 26 ft.; height, 10 ft. 11 ins.; weight, net, 1250 lbs.; fuel, oil and water for 300 miles, 420 lbs.; armor, 100 lbs.; useful load, 420 lbs. ; total, 2140 lbs.

It is expected that a new Burgess- Dunne aeroplane will be delivered at Pensacola early next month. This machine has some improvements over the first one that was obtained. In the aeronautic service of the U. S. Navy at the present time there are 18 officers and 77 men and 12 machines, covering: 6 hydro-aeroplanes, 5 boat aeroplanes and 1 boat and land aeroplane.

### ARMY ACCEPTS "AUTO-STABLE"

The BD-3 Salmson motored Burgess-Dunne was accepted on December 30 by a trial board of the Army, consisting of Lieutenants Fulois, Milling and Carberry. Webster flew the machine both on land and water with full load and his control of the machine both on the ground and in the air was a great surprise to all who witnessed the flights.

late 1914: - Mr. B.D Thomas, resigns his position as an aeroplane designer with Sopwith's and emigrates to the USA to work for Glenn Curtiss. His first project with Curtiss in 1914 is to design a “trainer”, which he does, closely following the Admiralty type 137 seaplane he had drafted for Sopwith's during the past year src Harald Penrose, pg 35

1914 : UK development of the Air Speed Indicator: originally devised as a stall warning indicator by Mr. Alec Ogilvie (who was an early owner of a Wright biplane built under license in the UK by Short Bros.) and Mr. Harris Booth, BA (Prior to the war he was conducting practical aerodynamic research for the Aerodynamics section of the UK National Physical Laboratory in Bushey Heath. On March 30, 1912 Booth was appointed to serve on the Research Committee of the Royal Aeronautical Society, 3 months later he was elected AfRAeS and by 1914 was a technical adviser to the Admiralty at RNAS Eastchurch) is progressing. The final instrument design is accepted by the AID and handed off for manufacturing production in 1915.

January 1915 : 5 months after the outbreak of the War, British aeroplane manufacturing capacity has multiplied, however only the Royal aircraft factory, Farnborough holds "wide-ranging" design and construction experience. Additionally as "the Factory" houses the National Physical Laboratory (NPL) dedicated to aviation, it also has the ability to undertake investigation of aerodynamic and structural problems in a scientific manner. <sup>70</sup> To date "the Trade" and "the Factory" had produced less than 200 landplane and 50 seaplane designs, of which 60 are experimental. <sup>71</sup> What was clear, was that there "was dire need for hundreds, and thousands" of aircraft to win the war.

01 January 1915 : The french infantry have lost 900,000 men, either killed, wounded or made prisoner. The British Expeditionary Force have lost over 90,000.<sup>72</sup>

1915 : Owen McDowall of Owen Sound, Ontario completes his airplane.

1915 : British Royal Navy re-introduces the "Non-Rigid Airship" into the fleet for long range maritime patrols - while battles at sea are fought on a relatively "flat" surface, hence precluding the use of "Short Range" aerial observation, the ability to detect the enemy's fleet at long range was required. This results in the "North Sea" or "NS" class of blimps which utilised an aeroplane fuselage suspended beneath the gas-bag from which the crew / pilot operated the rudder / elevator / gas valves etc.

1915 : the RFC is re-organised into "Wings", each under separate command officers, with two, three or, in some case four squadrons to each wing. At this time Lt.-Col. Sykes - formerly Officer Commanding, RFC is now "Gazetted" as "General Staff Officer, RFC". Sykes (a personal friend of Geoffrey deHavilland) is replaced in "the RFC in the field" by an Army Officer, "Boom" Trenchard

1915 : British Military Aeronautics Directorate <sup>73</sup> - Personnel:

1. Maj. Sefton Brancker,
2. Maj. Geoffrey Salmond,

1915 : British Army : Royal aircraft factory <sup>74</sup>- Personnel:

1. Mr. Frank Godden, Chief pilot
2. Mr. H.R. Parker, pilot
3. Mr. Mervyn O'Gorman,

1915 : the Editor of *the Aeroplane*, who normally advocated "the Trade" at the expense of "the Factory" commented on the new D.H.1 in comparison to the B.E.2c - even though Geoffrey deHavilland designed the B.E.2c " Everything is the simplest. There are practically no special:

1. stampings,
2. forgings,
3. pressings,
4. or other irritating "details"

which have been breaking the hearts of the unfortunate firms that have been persuaded to enter the aeroplane manufacturing industry by orders for B.E.2c, and the D.H.1 is a better aeroplane.<sup>75</sup>

## Notes on "Civil Aviation"

**1915 : RFC's Central Flying School : The D.H.1 is used for advanced flying training, wastage of the machinery is high, most pilots wrecking at least one aeroplane, but frequently 5 or 6, from bad landings".<sup>76</sup>**

Aviation called for a select and limited number of men; it required special aptitudes and training.

As a military arm in Canada, Aviation had no strong official support in 1915 as the Minister of Militia was understood not to care for this branch of the Service in comparison with others.

During that year there had been tentative private efforts at organization and training and the raising of the necessary funds ; an active class of young men were anxious to take up aviation and a movement along this line was energetically pressed by Col. W. Hamilton Merritt of Toronto.

It was understood that the British War Office wanted aviators and individual Canadians who went over from time to time soon found a place in the British service when its requirements were met.

Col. Merritt wrote the War Office as to his efforts to organize a Canadian Fund for the purpose of training aviators, which he had started months before, and a reply of Feb. 18, 1916, stated that his "scheme" (Programme) should prove of "material assistance" and that "on completion of their training in Canada, these men would be enlisted in the Royal Flying Corps as 2nd-class air mechanics, draw pay as such at the rates provided in the royal warrant for pay, etc., and be granted free passage."

Meanwhile Lieut.-Col. C. J. Burk, d.s.o., had been sent to Canada to make extensive first-hand inquiries regarding the possibility of training young Canadians to become military and naval aviators. Lieut.-Col. C. J. Burk had travelled from coast to coast making inspections, and on his return to London early in 1916 was understood to have reported favourably upon the proposals of Col. Merritt and others in Toronto, Winnipeg and Vancouver who had been specially anxious in the matter. Revived efforts followed with the appointment of a Committee

in Toronto (A. G. C. Dinnick, Chairman) to arrange the establishment

of a local Training School ; the collection of a Fund in Vancouver

to help the B. C. Aviation School in the purchase of 5

aeroplanes then under local construction; a statement dated Mar.

16 from H.R.H. the Governor-General that "he endorses the War

Office letter to the effect that if you train 5 to 10 candidates per

month for the Royal Flying Corps, who are under 30 years of age,

medically qualified, of proved British birth and obtain a flying

pilot's certificate, they will be accepted for enlistment in the Royal

Flying Corps during the War." It was, however, pointed out by

Col. E. A. Stanton in the same letter that "this has nothing to do

with a future Canadian Flying Service, as His Royal Highness

understands that the Canadian Government does not contemplate

any such department at present," On May 12 the Naval Services

Department announced from Ottawa that the Admiralty was calling

for a limited number of trained aviators from Canada for commissions

in the Royal Naval Air Service, and that, with a view to

providing training, the Curtiss Aviation School would be re-opened

in Toronto. Canadian aviators wishing to enter the service were

requested to apply to the Department and the age limits of candidates

were set at 19 to 25 years. Only well-educated, athletic

and thoroughly fit men, with excellent eye-sight, could be accepted.

A month later nine casualties were announced amongst the 400

or more Canadian Aviators already in the British service.

Meantime the Curtiss Flying School of Aviation had been underway

with 5 men a month in training at a payment of \$1,000 each

and, on July 13, a Deputation headed by Col. Merritt and Mayor

Church asked the Ontario Government to either aid in the establishment

of an Inter-Provincial School at Deseronto or join the

Dominion Government in granting \$100 to each student upon completion

of his course ; the "City Council granted \$8.00 a week to each

student from Toronto preparing for the Royal Flying Corps; the

British Government guaranteed \$375 of his expenses to each

accepted aviator. During the summer the movement extended and

from London came a cable on Aug. 23 to the Montreal Gazette

stating that "the establishment of a Canadian Flying Corps is

---

## Notes on "Civil Aviation"

urged not only for military utility but for commercial benefits, as it would mean a new industry for Canada, the proposal being to build the aeroplanes in the Dominion." It was added that 8 Canadian Flying officers were on their way to Canada to act as instructors. The Aviators in training at Long Branch, near Toronto, were inspected by H.R.H. the Duke of Connaught on Sept. 7 and a statement of work done and progress made by the Canadian Aviation Fund was read by Col. Hamilton Merritt who, also, urged the presentation by each Canadian Province of a squadron of 10 Battle-planes to the Royal Flying Corps. At the end of this month Capt. Lord Alastair Innes-Ker, d.s.c, arrived in Canada to recruit for officers and, men in the Military branch of the Service and he visited Ottawa, Toronto, Montreal, Winnipeg, Regina, Calgary, Vancouver and Victoria. Matters moved swiftly after this. Mr. Premier Hearst of Ontario returned from England in October strongly favourable to the establishment of a Canadian Corps and it was announced about the same time that an Aeroplane factory costing \$1,000,000 and equipped to turn out 6 machines a month was to be erected in Toronto with advance contracts of purchase from the British Government. The project was to be financed by the Imperial Government, and controlled by a Board of three members—one representing the Admiralty, one the War Office, with a business man nominated by the Imperial Munitions Board of Canada. It was understood that this action was taken as the result of a careful inquiry made in which the Board found that very large orders for aeroplanes had been placed in the United States—\$12,000,000, for instance, with the Curtiss Company of Buffalo. On Nov. 24 it was stated that Canadian Aeroplanes, Ltd., a creation of the Board, had been organized with a capital stock of \$500,000 for the purpose of taking over the Curtiss Aeroplane Co. plant in Toronto. Frank W. Baillie of the Canadian Cartridge Co., Hamilton, who had given to the Government \$750,000, representing profits on war orders, was appointed Managing-Director. J. W. Flavell, E. R. Wood and Mr. BaiUie were the men chiefly associated with the project which would, in time, involve many millions of capital and expenditure. In December the Naval Services Department called for more Canadian aviators for the

## Notes on "Civil Aviation"

Royal Naval Air Service and also for Canadian recruits as Naval Signallers and an Aero Club of Canada was formed, in touch with the Royal Flying Corps, with Col. Hamilton Merritt as President, Lieut.-Col. H. C. Cox, Toronto, Vice-President for Ontario; Carl Riordon, Montreal, Vice-President for Quebec; W. R. Allan, Winnipeg, Vice-President for Manitoba. Its objects were as follows:

"To encourage various forms of aviation, to develop the science of aeronautics and kindred sciences, to encourage the manufacture of aeronautic devices, to plan conferences, expositions and contests, to issue pilots' licenses to qualified aviators, and to assist those desirous of taking up aviation with a view to serving in the War. "

The year closed with a complete Squadron of Canadian airmen at Belfort in France and other Canadian aviators in Mesopotamia, on the Somme, at Dunkirk and in East Africa. In Montreal the Canadian Division of the Aerial League of the British Empire continued in 1916 its active work with Sir H. S. Holt as President and G. R. Lighthall Hon.-Secretary. The year 1916 began with a record for recruiting Military Affairs: which coloured public thought and influenced Government action throughout its course. Certainly, the and Policy response to the appeal of patriotism in the first three months of the year, the immediate reply to Sir Robert Borden's call\* for 500,000 men, was splendid. During January 29,212 men enlisted in all Canada, in February 26,658 enlisted, during (Source ref : THE CANADIAN ANNUAL REVIEW OF PUBLIC AFFAIRS - WAR SERIES BY J. CASTELL HOPKINS, f.s.s., f.r.g.s. 1916 published in Toronto, 1918)

January 1915 : A "scheme" (Programme) of co-operative aircraft construction was established in Scotland with G & J Weir as the central firm. This system utilised a number of small sub-contractors for the manufacture of aeroplane parts in conjunction with final assembly of the component parts in their own works. New system, aeroplanes were erected by the firm's own staff and handed over for flight test by the pilots of the Aeronautical Inspection Department.

03 February 1915 : The "Globe" (D.), Toronto, Wednesday, February 3rd, says that Capt. E. L. Janney, a Canadian aviator, who has made a name for himself both before and during the present war, has returned from the front on the steamer, "Zeeland," which arrived this morning. He has been doing scout duty for the British Army during the last few weeks. He is now returning to organise a squadron of aeroplanes to be built, equipped, and manned in Canada. [There is no officer of this name in the R.F.C.—Ed. - The Aeroplane 03 March 1915 pg 206]

10 February 1915 - the aeroplane, pg 133 - At the second annual motor show, organised by the Montreal Automobile Trade Association, and open from January 23rd to 30th, was exhibited a biplane, apparently on Caudron lines. The correspondent who has been kind enough to send a cutting from the Montreal "La Presse," a translation of which is given below, states that the official advertisement described the machine as a "military airship, fully equipped with a bomb-thrower and a Ross quick-firing gun!" "La Presse":- "For the public in general there will be several novel attractions ; thus one will see in a special corner a real aeroplane, armoured, and mounted with a cannon for rapid fire, which has been constructed in Canada ... by the Canadian Aircraft Co. This aeroplane is mounted with a rotative Gnome motor of 60 h.p. to furnish a speed of 60 m.p.h., carrying two persons. The wings are of the semi-rigid type, and it (sic) is similar to those which have been ordered by the English aviators' corps. The true power of this biplane has been demonstrated by the magnificent flights which Mr. G. Pollien has made at more than 4,000 feet above the city of Montreal."

20 February 1915 : "New York Times" :— Ottawa, Feb. 20th.—Considerable interest has attached to the incorporation this week of a new company which purjixises to manufacture and deal in aeroplanes and seaplanes particularly. The Curtiss Aeroplanes and Motors, Limited, which has an initial capital stock of \$50,000.00 has obtained a Federal charter and will have its head office at Toronto and, it is understood, will begin active work at once. Aeroplanes and seaplanes are going to take a more active part in the present European war than they have done, and many will be required. The firms within the British Empire which manufacture aeroplanes and seaplanes are taxed to their utmost to supply all that are required, and this has probably induced Curtiss to establish a branch factory in Canada. The official announcement of the incorporation of the company appeared in to-day's

## Notes on "Civil Aviation"

"Gazette." The explanation is that the principal parts of the aircraft will be shipped from New York to Canada and put together. src:  
- The Aeroplane 17 March 1915 pg 252

24 February 1915 : The Aeroplane, pg 181 : Canada has produced an aviator after an interval of nearly six years, since J. A. D. McCurdy first flew.

"La Presse" (Montreal) of January 23rd announces that Jack Laviolette, the famous athlete, "la crosse", hockey player, and "chauffeur" of racing automobiles, has the ambition to become an aviator, and every day for several weeks he has been to Coteau Rouge, near Montreal, where, under the direction of G. Pollien, he is learning to fly. Pollien is enthusiastic about Laviolette.

25 February 1915 : The "Daily Intelligencer," of Belleville, Ontario, says:— Sarnia, Ontario, Feb. 25th :—"A fact not generally known is that "Countess Zeppelin", wife of (the Nephew of) the inventor of the famous Zeppelin aircraft, is a Canadian girl. Mary McGarvey von Zeppelin was the daughter of the late W. H. MacGarvey, formerly of Petrolia, who died recently in Austria, where he had become one of the leading oil magnates of the country. She was born in the village of Wyoming, Lambton County, in 1875, going to Europe with her father at an early age." - Ed. The Aeroplane 24 March 1915 pg 278

The Montreal "La Presse" of March 5th reports :—"Lacolle, March 4th.—An aeroplane has flown over the country a mile from here at six o'clock this morning. Several persons worthy of trust are assured of having seen it at a great height and of having heard the sound of its helice. The machine was steering towards the west." - The Aeroplane 24 March 1915 pg 278

March 1915 : Demand and output of new aircraft and engines increased, Contractors had to deliver new machines to specified aerodromes located close to their own works instead of the previous method of supplying new aircraft to Farnborough for acceptance. The previous method meant supplying new aircraft to Farnborough for acceptance, under the new system, aeroplanes were erected by the firm's own staff and handed over for flight test by the pilots of the Aeronautical Inspection Department. This eventually led to the establishment of a number of Aeroplane Acceptance Parks.

03 March 1915 : USA : The Naval Appropriation Act. approved March 3. 1915. provided for and established a National Advisory Committee for Aeronautics, the President to appoint not to exceed twelve members, to consist of two members from the War Department, from the office in charge of military aeronautics: two members from the Navy Department, from the office in charge of naval aeronautics; a representative each of the Smithsonian Institution, of the United States Weather Bureau, and of the United States Bureau of Standards ; together with not more than five additional persons who shall be acquainted with the needs of aeronautical science, either civil or military, or skilled in aeronautical engineering or its allied sciences. The members of the Advisory Committee for Aeronautics, as such, shall serve without compensation. It shall be the duty of the Advisory Committee for Aeronautics to supervise and direct the scientific study of the problems of flight, with a view to their practical solution, and to determine the problems which should be experimentally attacked, and to discuss their solution and their application to practical questions. In the event of a laboratory or laboratories, either in whole or in part, being placed under the direction of the committee, the committee may direct and conduct research and experiment in aeronautics in such laboratory or laboratories. Rules and regulations For the conduct of the work of the committee shall be formulated by the committee and approved by the President. \_The sum of \$5,000 a year, or so much thereof as may be necessary, for live years is appropriated, out of any money in the Treasury not otherwise appropriated to be immediately available, for experimental work and investigations undertaken by the committee, clerical expenses and supplies, and necessary expenses of members of the committee in going to, returning from, and while attending, meetings of the committee. An annual report to the Congress shall be submitted through the President, including an itemized statement of expenditures. Here is the committee :

Gen. George P. Scriven, Chief Signal Officer and Lieut-Col. Samuel Reber, aviation section. Signal Corps, representing the Army ; Capt. Mark L. Bristol, Director of Aeronautics, Navy Department, and Naval Constructor Holden C. Richardson for the Navy; Dr. Charles D. Walcott, secretary of the Smithsonian Institution; Charles L. Marvin. Chief of the Weather Bureau-, Dr. S. W. Stratton. Chief of the Bureau of Standards. Assistant Secretary of the Treasury Byron R. Newton, Prof. W. F. Durand, Stanford University; Prof. Michael I. Pupin. Columbia University; Prof. John F. Hayford, Northwestern University, and Prof. Joseph Ames, Johns Hopkins University, represent the contingent of "additional persons who shall be acquainted with the needs of aeronautical science, or skilled in aeronautical engineering or its allied sciences." Dr. A. F. Zahm is Recorder of the Advisory Committee.

10 March 1915 : A Canadian reader of Tnii Aerciopl.vnf. writes :—"I have been a reader of your magazine for a considerable period, both at home and abroad. I have been very much absorbed in some of your topics, and amused at some of your jokes, but I can truthfully say that when I read the account re Capt. E. L. Janney under the 'Canada' heading, I was amused and interested

## Notes on "Civil Aviation"

at the same time."

The writer of the letter goes on to state that the original Canadian Flying Corps was composed of three men, Capt. Jannev, Lieut. Sharpe (who was killed at Shoreham in Feb 1915), and Sergt.-Major H. A. Farr ; also there was a Burgess-Dunne biplane, good for at least 40 m.p.h. in a calm. This machine now reposes in a shed on Salisbury Plain, and is not even a vision of its former self, not through any accident, for it has never been flown in England, though it flew much in the United States, being used by the Burgess Co. as a demonstration machine for "steep years," as he puts it.

There is, however, a good Curtiss O.X. motor rusting away, and only needing an overhaul.

Apart from this, the Canadian Flying Corps now appears to consist of the Sergt.-Major only, without an aeroplane, for the last heard of Capt. Janney was that he was on his way to Canada, as plain civilian Mr. Janney, it having been announced in orders that he had resigned his commission. It is stated that he was never in the R.F.C., he has never flown in England—not even as a passenger—and he has never been on service on the Continent.

There seems to be an idea in Canadian circles that the R.F.C. will not undertake to train any more Canadian aviators since the death of Lieut. Sharpe. src - pg 230 The Aeroplane. March 10, 1915.

14 March 1915 : USA : BEACHEY KILLED.

Lincoln Beachey, known by sight to hundreds of thousands of people all over the country and by reputation to the whole world, met death in one of his hair-raising "dives to death" at the exposition at San Francisco on March 14th. He began the steep dive several (5) thousand feet up and when he straightened out his monoplane it gave way under the strain (structural failure of one wing and then the other) and Beachey, strapped to his machine, fell entangled in the remnants into San Francisco Bay. Beachey had had built for him a new monoplane and this was the machine he used in the fatal flight. A diver from the U. S. S. Oregon located the wrecked machine and it was hauled to the surface of the water 2 hours later. An examination by a surgeon showed that Beachey "was still alive when he struck the water and had sustained no major injury as a result of the fall, except a broken leg." There were evidences of a struggle to free himself from the mesh of twisted wires and parts and the direct cause of death was drowning. (Aeronautics pg 23 March 15, 1915)

31 March pg 309 - the aeroplane : The correspondent of "La Presse" of Montreal at Quebec reported on March sth that M. J. M. Landry, the well-known French-Canadian aviator, has received a letter from Colonel Stanton, Secretary to the Governor-General, seeking his aid in the formation of an aviation corps. M. Landry has replied in the affirmative and is now actually in touch with the promotion of the project.

\* \* \*

From the "Montreal Daily Star" :—Toronto, March 12th.—The British War Office has asked the military authorities in Canada to forward at once the names of any British subjects who are qualified aviators or airship mechanics. (Here are given the rates of pay.) Competent men will probably be given positions in the Imperial Service or Royal Flying Corps.

\* \* \*

From the "Daily News," Prince Rupert, B.C. :—Toronto, February 25th.—Discussing the possibility of an airship raid on Canada from the U. S., Mr. J. A. MacCurdy, the Canadian aviator, said to the "Daily News" correspondent : "It is possible, but not at all probable, for unless the machines were built secretly for a raid it would not be possible to get four high-powered machines in any town in the States. Apart

## Notes on "Civil Aviation"

from machines at the factories and those held by the military authorities, there are only about one dozen machines in the States which could make the journey, and these are flying-boats. It is a comparatively easy matter for a person to be deceived as to the sound of the engines," added Mr. MacCurdy. "Railway engines in blowing off steam often make a purring sound which is identical with the noise made by aeroplanes." Mr. MacCurdy further explained that nearly all the aeroplanes in the States are small ones, used solely for exhibition purposes, and these had only a short radius and could fly only about 200 ft. high. For a long flight much larger engines were needed and the ability to carry a large supply of petrol. Another and an important reason why the story looked wrong was that aeroplanes practically never fly by night. This is because of the difficulty of landing.

07 April 1915 : The Aeroplane same date pg 332 : Canada provides very little else but amusement as usual. From the "Daily Intelligencer," Belleville, Ont. :

—  
Aeroplane Visits Worry Kingston. 3 Last Week, and Another Yesterday. "Sinister End in View." Kingston, Ont., March 16th.—^ During the past 4 days four aeroplanes have been seen operating in this district. Last Friday three were seen operating over Lake Rideau, and yesterday afternoon another one was discovered in the same place flying towards Kingston. As there are no aeroplanes of the Militia Department in this vicinity, those which have been seen flying about here are thought to have some sinister end in view, either the destruction of property or the surveillance of the troops now in training here for overseas service. From the Calgary "Daily Herald," Ottawa, March 13th.

—  
The Dominion police are at present investigating reports which have been received from time to time from different points to the effect that aeroplanes have been seen flying above Canadian territory. From the "Daily Gleaner" (Fredericton, N.B.)—St. John, March 16th : Lieut.-Col. Armstrong has received orders to recruit volunteers for an aviation corps. No details are given of the plans of the corps. From the "Daily British Whig" (Kingston, Ont.)—Kingston, March 17th : Corporal Eugene de Boliac, of the Eaton Motor Machine Gun Battalion, Toronto, is the first aviator to respond to the British War Office's call to aviators in Canada to volunteer for service at the front. He is a Swiss, and has flown for Bl^ riot, De Lesseps, and Curtiss.

14 April 1915 : the aeroplane pg 360 : From the "Calgary Daily Herald" :— Calgary Boys in Aviation Service.—J. Turner Bone and Spencer Kerby, who left Calgary for England a short time ago with the view of joining the Aviation Service, have announced by Marconi-gram that they have both been appointed probationary flight lieutenants of the Naval Wing. Considering that these young men only landed in England a week ago, they are meeting with a marked amount of initial success.

21 April 1915 : CANADA.

"According to a message from Ottawa on April 14th 1915, volunteers for the Royal Naval Air Service are being called for in Canada. They must be under thirty years and preferably between nineteen and twenty-three. The Volunteers will be trained in Canada and sent to England. It would be interesting to know how Canada proposes to provide training of any kind for air mechanics." Source : The Aeroplane, 21 April 1915, pg 384

21 April 1915 : U. S. A.

An astonishing article, written by one Gordon Bruce, appeared, recently in the "New York Tribune," professing to deal with the "chin-wagging"—one can call it by no other name—of that "Captain" Janney of whom no one in this country seems to have heard. The heading of the article ran thus :

—  
"Veteran British Airman, Here to Train Canadian Recruits, Finds War Life Dull Except in Spots."

"Veteran" is good, considering that he has not flown in England, or—so far as one can gather—on the Continent either. The article continues :

—  
"Two ruddy-cheeked young men, attired in British uniforms, sat yesterday at the luncheon table in the Aero Club of America. One was Captain E. L. Janney, squadron commander in the Royal Flying Corps. He is fresh from the battle front. His companion was Lieut. Harley G. Smith. They are in America, on seven months' leave for the purpose of training recruits for the flying corps, which soon will be a part of the Canadian' forces.

"

This Janney is not even an officer of the Royal Flying Corps, and if he is still an officer in the British-Canadian Service one would like to know what he was doing in uniform in a neutral country if not an Embassy Attache or an interned officer. He is reported to have said :

—  
"My actual fighting experience covered a period of nine weeks. I was stationed with my squadron at Bailleul, in France, near the Belgian border. Most of the time it was rather dull. That is to say, (the percentage of time when we were actually doing anything was small."

So far as one can gather, the time when he was doing anything, except talk—if he was ever there at all—was nil.

Later on he said :

—  
"One feature of air fighting that has come to the fore rapidly is dart-dropping. Steel darts were first used by the French, but have come into general use among the British and German forces. I daresay that more damage can be done in the trenches by the dropping of explosive bombs, but the darts are more popular among the fliers."

This is a lie. The Royal Flying Corps hardly use darts at all. They regard them as rather unsportsmanlike and somewhat ineffective. He describes dart-dropping thus :

—  
"There is not much preparation required for dart-dropping. You just scoop them up and shovel them over the side." Which shows that he knows nothing about darts, which are not dropped in that way at all. He then proceeds to show his ignorance about aeroplanes thus :

—  
"The Taube, which is popularly supposed to be of moderate speed, is capable of 86 miles an hour. It is unable to climb faster than 750 feet a minute, as against 1,200 ft. a minute by

## Notes on "Civil Aviation"

the British machines."

Which is liable to bring a smile even to the face of a boxkite pilot. Then we come to the real business, for the article continues thus : "The business which has brought the two officers to this country is the establishment of an aviation training school at Toronto. Two Farman biplanes have been shipped from England for use by the students, and Captain Janney announced that he had purchased the old Farman machine owned by Clifford B. Harmon, of this city."

This was an aged 50-h.p. thing of 1911 type.—To continue :—

"The school is open to civilians who desire to enlist in the flying corps of Great Britain, and those who qualify will accompany the Canadian expeditionary forces. Four months are allowed for training. In order to be sure that the student will carry out his intention to enlist, a fee of \$500 will be charged for the training. This will be returned in the form of a bonus.

• of \$625, which will be paid by the Canadian Government when the student has qualified. The actual bonus is \$375, but there is a uniform allowance of \$250."

The \$500 is evidently the business which brought the two "officers" to the States. It is not the custom of the British Empire to take deposits from those desiring to serve it, and it seems improbable that any innocent American handing over his \$500 will ever see it again, or an aerodrome. The American is the most gullible person in the world—as anyone can judge by reading the advertisements in the American press

—  
but one hopes that no one has been silly enough to be taken in by this swindle.

Meantime, it is to be hoped that the Department of Military Aeronautics has already heard of this insult to the British uniform and has taken steps accordingly through the Foreign-Office to have a stop put to this adventurer's career.

Thanks are due to a firm of American aircraft manufacturers who sent the cutting with the sarcastic remark : "Captain Janney is going to make all our fortunes." But who is this "Gordon Bruce" who drags the Aero Club of America and a well-known New York paper in as evidence for the long firm game?—src - pg 384 the Aeroplane. April 21, 1915.

28 April 1915 : The Aeroplane pg 410 : The "Times" reports that the Canadian Department of the Naval Service has arranged with the British Admiralty for the training in Canada of candidates for the Royal Naval Air Service.

The flying school, which is being established near Toronto, will be in charge of Mr. J. D. McCurdy, the Canadian aviator.

The "Times" correspondent at Ottawa wired on April 21st :

"The Naval Department is being fairly inundated with inquiries from Canadians replying to the call for aviators for the Royal Aerial Service.

Mr. McCurdy was in conference with the authorities at Ottawa to-day, when arrangements were completed for starting the training of prospective recruits."

The choice is a wholly excellent one. Little has been heard of Mr. McCurdy of late years, for he never lowered himself to the status of an aerial acrobat or a country-fair mountebank. It will therefore surprise most people to learn that during the winter of 1908-1909, before anyone had flown any considerable distance in Europe, Mr. McCurdy and an American, Mr. Baldwin, flew over 1,000 miles in Nova Scotia on a biplane of a type evolved by them in collaboration with Mr. Glenn Curtiss. This machine started from and landed on the ice of a frozen harbour.

Since then Mr. McCurdy has been further associated with Mr. Curtiss, and on one occasion flew from Florida to Cuba on a Curtiss boat. As one of the great unadvertised pioneers of aviation, Mr. McCurdy, in the British Empire, deserves to rank with Messrs. Grace, Ogilvie, McClean, and Cockburn, all of whom are now serving the Empire, though Mr. McCurdy antedates all of them as a flier.

## Notes on "Civil Aviation"

28 April 1915 : The Alleged Aviator.

'The following note by one who knows him may assist those who come in contact with the subject of a recent article from the U.S.A. :—

The exploits of the famous, or infamous, "Captain" E. L. Janney are thrilling enough to make good copy for a short story. Anyone who could be more ignorant than this Janney on aviation matters would be ignorance itself. I have met him.

He introduced himself to me at Shoreham—a very undignified procedure for a "Captain," as, be it remembered, I am a person of no importance. The "New York Tribune" describes him as a ruddy-cheeked young man I should describe his cheek a little more vulgarly. (I have knocked about 'Aerodromes for many years.) He talks "Yank" more or less successfully, and is an adept at pulling legs. He pulled mine (I am an Englishman), for he asked me to join his Canadian Flying Corps. There was nothing in that, but—he asked me for £200 as a deposit for my uniform. There was something in that, but before the business was finally settled he had suddenly disappeared.

Not, however, before he pulled the legs of others, and packed an aeroplane, and took its measurements, and had a crate made, and nearly sent many of us crazy with "I guess that's good 'nough for me," and—oh ! and dozens of other things. Yes ! he did fly—as passenger in a box-kite.

What a sight it was ! A beautiful, brand new uniform with "Royal Flying Corps" written on it, a body inside it— "Captain" E. L. Janney.

It was a purely unpaid-for joy-ride—a flight obtained under false pretences. If the machine suited him he would buy it on behalf of the Canadian authorities ! I am sure the Canadian authorities would appreciate his ability in purchasing a two-year-old box-kite for war service.

There are many other little stories I could mention about "Captain" Janney, but if he wants them in print he must see the advertisement manager, as your paper is not published for the benefit of alleged aviators like the "Captain."

— "Sinro." - src: The Aeroplane 28 April 1915 pg 410

05 May 1915 : From "New York Times " :—

Greenwich, April 15th.—Capt. Janney, of the Royal Aero Corps of England, who returned recently from active service, has purchased from Clifford B. Harmon a Farman biplane equipped with a Gnome 80-h.p. (80-h.p. in this account, not 511 h.p., as published in The Aeroplane, April 21st) motor, which has lain idle for nearly three years. Capt. Janney, Lieut. Leigh and workman have been busy for several days in getting the machine ready for shipment to Toronto, where Capt. Janney has an aviation school. The pupils at the school are drilled for active service.

[It seems nearly time that "Captain" Janney became known in Canada and the U.S.A.—Ed C.G.G.] src - Aeroplane same date pg 440

12 May 1915 - The aeroplane pg 470 : .V Reuter Agency telegram from Toronto contains the following cryptic message :—"Twelve recruits have been enrolled in the Government flying school for training airmen for the British Army."

[It is not the custom to train "recruits" to fly, so it is a little difficult to understand exactly what is meant. One wonders whether this is another of the notorious "Captain" Janney's efforts.—Ed.]

26 May 1915 : The Aeroplane pg 542 : SITUATIONS VACANT.

WANTED, Fitters, Erectors, and men for all branches of aeroplane work. There are also vacancies for two good Foremen. Applications can only be entertained from men not at the moment engaged on this kind of work for other manufacturers. Applicants who have not already had experience in the construction of aircraft, but whose present trade would be of assistance, such as cabinet-makers, boat-builders, wireworkers,

## Notes on "Civil Aviation"

sheet metal-workers, welders, upholsterers, engineers' fitters, etc., etc., should also apply. The hours will be from 6 a.m. to 6 p.m., with overtime till 8.30 p.m., for those physically capable. Saturdays, 6 a.m. to 5 p.m. Sundays, 8 a.m. to 1 p.m. Good wages, with bonus on production. Fares paid to men stopping minimum two months. Long engagement to really first-class capable men.—Apply by letter, stating fully past experience, references, wage expected, to the Portholme Aerodrome, Ltd., St. John Street, Huntingdon.

EXPERIENCED FITTERS. —Fitter-erectors and Wiremen wanted in large factory building "Short" machines.

—  
Apply, stating experience and wages required, to Box No. 648, "The Aeroplane," 166, Piccadilly, London, W.

MISCELLANEOUS - AERONAUTICAL ENGINEERING.—Correspondence tuition in sections or complete course, 12 lessons.—British School of Engineering, 36, Maiden Lane, W.C.

HARDWOOD for Aeroplanes. Specially selected, air-dried timber as supplied to leading constructors in Britain and the Continent. Silver Spruce, Ash, Poplar ; Hickory and Ash Skids ; Three-ply ; Thin Cedar and Mahogany for Floats ; Walnut for Propellers.—William Mallinson and Sons, Ltd., Hackney Road. 'Phone, 3854 Central, 4770 Wall.

28 July 1915 - The Aeroplane, pg 115 - TO "TRAINED ENGINEERS".

The Aeroplane has been authorised to make the following announcement : — There are now vacancies for Examiners and Viewers in the Aeronautical Inspection Department, South Farnborough.

The total pay and allowances of Examiners varies between £3 14s. and £4 4s. per week, and of Viewers between 35s. and 48s. per week.

Candidates for Examiner-ships should be gentlemen having a good theoretical and practical training in engineering, and a knowledge of micrometer measuring instruments.

Preference will be given to gentlemen who are unfitted for military service.

These appointments provide patriotic men, having the necessary qualifications, with an unequalled opportunity to serve their country.

[One is inclined to envy the men who are so fortunate as to secure these vacancies, for the A.I.D. is not only theoretically one of the most necessary establishments connected with aviation in this country, but it is one of the most efficiently organised and managed, and is, therefore, highly effective.

A.I.D. inspection is primarily responsible for the extraordinarily small number of breakages in the air which have occurred to British-built aeroplanes since the department was established, and for the maintenance of the high standard of quality of British machines despite the rush of war work.

The balance which the Department has maintained between the desire for safety and the demand for quick delivery is very remarkable. Therefore, anyone who has the luck to join the Department now may be certain that his ability will be most usefully and efficiently employed, and that he will be able to work under the best possible conditions under highly intelligent and able senior officials. There is full scope here for the best class of man to serve his country in the most efficient manner.— C.G Grey.]

12 May 1915 : A Reuter Agency telegram from Toronto contains the following cryptic message :—"Twelve recruits have been enrolled in the Government flying school for training airmen for the British Army."

[It is not the custom to train "recruits" to fly, so it is a little difficult to understand exactly what is meant. One wonders whether this is another of the notorious "Captain" Janney's efforts.—Ed.— C.G Grey] src: aeroplane pg 470 same date.

17 May 1915 : On Monday, May 17th, H.R.H. the Duke of Connaught inspected the MacCurdy Aviation School. (Vide the Canadian Press in "general".) src The Aeroplane 16 June 1915 pg 626.

19 May 1915 : CANADA : "Mr. J.A.D. MacCurdy, the Canadian aviator, who, with Capt. Janney, is the director of the Military Aviation School in Toronto, was in Ottawa yesterday conferring with officers of the Naval services through which recruits will be enlisted. Work is to be started at once and there are over 100 applicants so far. Mr. MacCurdy will carry out the instructional work for the operations of both aeroplanes and hydroplanes (sic) at Toronto Island. He is authorised by the British Aero Club (sic) under

## Notes on "Civil Aviation"

whose direction the school is to issue certificates of qualification." - Montreal Daily Star, April 22nd, 1915 src: aeroplane pg 502 same date.

21 May 1915 : From the "Globe," Toronto, May 21st.—"Trials were carried out yesterday with one of the latest type of biplane, a machine capable of 85 m.p.h. The tests were made in the presence of two representatives of the British Government." One also gathers from the "Globe's" account that the tests were conducted on a local rifle range, the surface of which is very uneven and greatly needs levelling. src The Aeroplane 16 June 1915 pg 626.

25 May 1915 : 2 entries From the "Globe" of May 25th :

1. One of the three aviation schools in Toronto has received a request from an Ottawa lady for particulars of the fees for a course of training." src The Aeroplane 16 June 1915 pg 626.
2. Mr. Dean, accompanied by a pupil, met with a mishap on a flying-boat on his last trip. The motor-launch which usually accompanies the machine happened to be away when the flying-boat sprang a leak and the gasoline tank was empty. The water, to make matters worse, was rather rough. They succeeded in dismantling the wings and beaching the boat, none the worse for their experience. src The Aeroplane 16 June 1915 pg 626.

07 June 1915 - the aeroplane pg 547 : On "Arms and Services" : Various and sundry people who write about aeronautical matters without comprehending the constitution or work of the King's armed forces seem to be trying to revive the old foolish idea of a separate Air Service, distinct from the Navy and the Army, with an Air Minister in charge. They argue that aircraft are not a mere arm, but something in some mysterious way entirely different and superior.

It would be equally sensible to suggest a Ministry of Automobilism to control all the Navy's armoured cars, transport wagons, motor boats, submarines, and portable wireless plant, as well as the Army's mechanical transport, staff cars, motor-cycles, and so forth and so on, just because they all happen to be driven by internal combustion engines.

Aeroplanes and airships are simply new vehicles, differing only from land-going automobiles in that they operate in a third dimension. In other ways they do not differ from any other means of locomotion used by the Services.

The work they and their pilots and their passengers do is an integral part of the work of the Service to which they belong, and must be subsidiary

01- auxiliary to the work of the other units of that Service.

If Naval aircraft operate ashore they should, if they are to be of any real value, work in conjunction with the Army, and under the orders of the G.O.C. in-Chief, just as the R.N. division in the Dardanelles is merely there to do the work of infantry. On the other hand there is never any likelihood of Army aircraft working at sea with the Fleet, though they may assist in coast defence, just as the Garrison Gunners may do, or as the old Submarine Miners (Royal Engineers) used to do.

The link between the Royal Naval Air Service and the Royal Flying Corps can never be closer than that at present existing between the Navy and the Army, if each of the Flying Services is to remain efficient, and, for the same reason, a Ministry of the Air is as impossible a thing as would be a Ministry of Artillery, or, as already suggested, a Ministry of Automobilism.

\*\*\*\* A Possible Department of Aerial Communications\*\*\*\*

I would, however, make this distinct reservation, that when in the dim and distant future peace breaks out, and internal dissensions begin, it may be necessary to have a Minister of Aerial Communications, for purely civil purposes, whose duties would be analogous to those of the French Minister of "Ponts et Chaussées," or of our own Postmaster-General, or of a possible Minister of Railways—which we shall also have.

But such a Minister would have nothing whatever to do with the aircraft of the Navy or Army.

He would control civil aerodromes, look after pilots' certificates—which would entail the ability to fly properly.

He would see to the licensing of aircraft.

He, or, rather, his minions, would inspect aircraft with an eye to their fitness to be trusted over the heads of the terrestrial population, and so forth.

## Notes on "Civil Aviation"

Which looks like providing a comfortable job in the future for Lieut.-Commander Harold Perrin, R.N.V.R., now of the Armoured Car Division, as permanent Under-Secretary for such a department, for he would be just the man to teach each successive Minister his job.

Nevertheless, that has nothing to do with the absurd dream—or, rather, nightmare—of a separate Air Service.

### What is a Service?

It may, perhaps, be well to distinguish clearly between an Arm and a Service. The two great Services are, of course, the Navy and the Army, and sub-divisions of these may perhaps be called separate vServices, just as the Navy has the Submarine Service and the Royal Naval Air Service. The Army, on the other hand, apparently prefers to call its separate branches Corps, as in the case of the Royal Flying Corps, the Army Service Corps, and the Corps of Royal Engineers, though, in fact, each of these various Corps are quite as much Services as is the Royal Naval Air Service. The real distinction apparently between an Arm and a Service is that an Arm operates in conjunction with another Arm of the same Service, as aircraft and Cavalry work as scouts for the Main Army, or as Aircraft observe artillery fire, whereas a separate Service conducts its own manœuvres "in its own damper tinker fashion"—as the Admiral remarked to Mr. Kipling's friend, Mr. J. Moorshead, Sub-Lieut., R.N.—and according to its own rules, just as the Army operates separately from the Fleet.

Two Services may co-operate as the Navy and Army are co-operating at the Dardanelles, and sections of one Service may co-operate with another Service just as the Naval Brigade co-operated with the Army in the Khartoum Expedition, and as detachments of the Royal Naval Air Service are—more or less—co-operating with the Army at present.

In a general way it may be taken that a vService shall be able to conduct operations on its own account without assistance from or co-operation with any other Service.

Admitting this hypothesis, it seems obvious that an Air Service as such, apart from the Navy or the Army, is at present an impossibility. Further, it is impossible to see how a separate Air Service can ever become a possibility in the future, because the training of a soldier for land warfare and the training of a sailor for Naval warfare are so different that it would not be humanly possible for one man to become thoroughly competent in both branches of vScience. For which reason it will appear that even if an attempt were made to produce a separate Air vService, that Air vService itself would have to be split into absolutely distinct sections, one for Naval operations and one for Military operations, the former consisting of officers trained as sailors are trained, and the latter having its personnel trained in Military Science. Thus, it seems clear that aircraft must remain definitely as Arms of the two existing Services.

Cases in Point.

^hereof as a minor example, apart from the higher

Training of Service aviators in the Science of Naval and Military strategy and tactics, which is necessary to a highly practical officer, consider the case of a pilot trained as a soldier and handed over for naval work. He may be a first-class flier, and he may be able to handle big seaplanes quite nicely at the first attempt, when operating from the shore, but what kind of a fist is he going to make at first of bringing a 250-lb. seaplane alongside a ship in a seaway, and how long is he going to take to learn the tricks of getting alongside, hooking out, hoisting, stowing, and so on?

The seaplane-carrying ships have not an unlimited number of spare machines down at rail-head ready to be flown to the advanced base at half an hour's notice, as is the Army custom, and the pilot who "crashes" a big seaplane is liable to be spoken to in a manner not used to a military pilot who stands a B.E.; on its nose. Contrariwise, if a pilot is trained to navigate over the open sea during a six-hours' patrol, to alight in a six-foot sea, and to come alongside "handsome," what chance has he of learning to land a 90 m.p.h. "tabloid" in a live-acre field which can only be reached by doing a right angle turn between the pinnacles of the local cathedral and scraping over the roof of the sacristy? Some people argue that the pilot need only be a good aerial chauffeur, and so can acquire all the tricks of sea and land. Which may be true to some extent, but the best Service aviator is going to be quite a different animal.

Not a Chauffeur's job.

Already the best work, as scouts, as bomb-droppers, and as artillery "spotters," has been done by officers flying alone. In the future it will be even more so.

The specially trained air-officer will treat his aeroplane as a vehicle only. The act of flying will be the simplest part of his work. Every man with a gentleman's education will fly, just as he can ride a horse to-day. Nevertheless, the cavalryman's technical use of his horse is different from the gunner's use of him. And similarly the scout, the bomb-dropper, and the "spotter" will use different types of aeroplanes, and will handle them differently, in fact, it is already so to-day, for one finds some lucky pilots who have made reputations, actually with a regular stud of aeroplanes of different types for their own private use for different purposes.

One does not send a coachman to drive a cavalry scout's horse, and one will not send a pilot to fly an air scout's aeroplane. And, anyhow, why use two men in an aeroplane when one is enough?

The chauffeur's job will only come in with the fighting machines, for the gun-carrier will need a pilot just as the artillery need drivers who can handle horses but not guns. Even so, the sea-chauffeur is going to be different from the land chauffeur, just because the finest car-driver on the road would pile up the simplest motor-boat, through sheer ignorance of the habits of water, and vice versa.

So one sees that the technical training of the Air-and-Sea, and that of the Air-and-Land Services, must be

## Notes on "Civil Aviation"

essentially different from the highest to the lowest ranks.

### On Mr. Churchill's Opportunity -

If such a thing as a separate Ministry of the Air were a working proposition, which it is obviously not, the one person fitted to be head of such a department is Mr. Churchill, and one hopes in due time to see him the first Minister of Aerial Communications. — The great puzzle is how his intimate knowledge of aviation and all its workings may now be best utilised.

The history of Lancaster does not seem to have much connection with flying—unless it includes the sands at Waterloo, near Liverpool, the airship sheds at Barrow-in-Furness, and the aeroplane sheds at Bournemouth—Lancaster. Even if it did, the whole lot would seem very small beer to Mr. Churchill after the somewhat heady effervescence of the R.N.A.S. entire.

Still, aviation cannot afford to lose Mr. Churchill any more than Mr. Churchill could bear to give up aviation. I verily believe that Mr. Churchill is more keenly interested in the smallest "Schneider tabloid" than in the biggest battleship. He knows a great deal about the Navy, but he knows a great deal more about aviation in connection with the Navy. May a mere journalist venture a suggestion to the Cabinet?

### The First Air Lord.

Their Lordships of the Admiralty are of various kinds. There is the First Lord, a civilian, there is the First Sea Lord, a sailor, there are various other Sea Lords, each of whom controls his own department, water-tight below the surface but communicating — generally amicably—with all the others.

Would it be possible to form yet another department under an Air Lord, specially to deal with the Air Service, and to represent the Air Department in Parliament if necessary? If such a thing were possible Mr.

Churchill is obviously the only man for the job. He would have his work at his finger-tips, which is more than can be said of most heads of departments. He would have independent control, in so far as the Air Service would carry out independent operations in certain

fields of activity, such as raids and anti-aircraft defence, and so on. In other respects his department would co-operate with the rest of the Navy as an integral part thereof rather than be subordinate to it.

He would be free to concentrate the whole of his admirable mental activities on one job, with results which could hardly fail to be of the highest value, and he would apply himself to the work with the greater good will because it happens to interest him.

Those who know anything of the R.N.A.S. realise how highly Mr. Churchill is esteemed by all who have been concerned with the building up of that Service, and how deeply his loss would be regretted. The R.N.A.S. is destined to be the biggest semi-independent branch of the Navy, and no one is better fitted than Mr. Churchill to accelerate its progress towards its ultimate development. If he cannot be the first Air Minister, cannot he be First Air Lord of the Admiralty?

### An Old Idea Reclothed.

It has been suggested by the writer who displayed such gross ignorance about airships that a "National Air Service" could be formed with stations in various sea-coast towns for the express purpose of repelling hostile aircraft. This is a very old idea dating back to the period when the City of Liverpool endeavoured to raise a squadron of aeroplanes on its own account, and it was then shown fairly clearly that though a series of such squadrons of local aerial volunteers was quite a working proposition, the whole system would have to be under the control of the Admiralty or the Navy, whichever Service was responsible for coast defence, for the very good reason that these squadrons and their stations would have to be subordinated to the general scheme of defence, and co-operate with that scheme.

To form such a volunteer Air Service at the present moment seems obviously impracticable, because, in the first place, every available aeroplane is needed for active service abroad, or for existing coast defence stations belonging to the Royal Naval Air Service; and, secondly, because practically every man of an age to become an aeroplane pilot is merely waiting his turn to join either the R.N.A.S. or the R.F.C.

When the war is over, and we have time to reorganise our whole Naval and Military system, it is highly probable that the Royal Flying Corps will have its Territorial squadrons. Similarly, coast towns may have local detachments of seaplanes, manned by the R.N.R., or R.N.V.R., and under the control of the R.N.A.S. Here the First Air Lord would have still further scope for his activity.

## Notes on "Civil Aviation"

But, under existing circumstances, no scheme for forming localised squadrons of aircraft is workable.

The time will undoubtedly come when air fleets will be formed capable of carrying on war on a large scale in the heart of an enemy country, but, as already suggested, the units of such a fleet must have either a Naval or a Military (Army) training.

They cannot have both. — C. G. G. - the Aeroplane 02 June pg 550

02 June 1915 - The aeroplane : Mr. J. E. M. Pritchard entered as prob. flight sub-lieut. for temp. service, and appointed to the "President," additional, for R.N.A.S. src: "the London Gazette," May 28th, 1915.

09 June 1915 : Mr. Gordon Bruce, the author of the article on the notorious "Captain" Janney which appeared in the "New York Tribune," writes the following very sportsmanlike letter:—

"Dear Sir,—In your issue of April 21st you took occasion to refer to an article written by me, quoting a man who represented himself to be Captain E. L. Janney, of the Royal Flying Corps. The editorial comments accompanying your reprint of certain extracts could hardly be construed as complimentary to me. That, as well as the fact that several other reputable New York papers printed similar stories without drawing criticism from you, can be passed over. / However, perhaps I can answer your question, 'Who is this Gordon Bruce who drags in the name of the Aero Club of America and of a reputable New York paper like the "Tribune," etc.?' Also, it may be well to vouchsafe a few words of explanation as to the circumstances under which the story was written.

'I am the aeronautical writer of the "Tribune." As to my qualifications for the job you may consult any of the following gentlemen : Orville Wright, Glenn H. Curtiss, Squadron Commander John Cyril Porte, Royal Flying Corps; Lyman J. Seely, manager Curtiss Aeroplane, now at the Savoy Hotel, London; Lieutenant-Commander J. H. Towers, U.S.N. Naval Attaché at the United States Embassy, London ; Mr. Burns, formerly of the Austro-Daimler Motor Co., whom, I believe, you are acquainted with; Alan R. Hawley, President of the Aero Club of America; Captain Thomas S. Baldwin, New York; and Frank Hillier, of the London "Daily Mail." So much for that. [Commander Porte, R.N., is not R.F.C.—Ed.] 'As to the story to which you object—the man known as Captain Janney was introduced at the Aero Club of America by two responsible members. He was known to have purchased two aeroplanes and one motor, for which he paid cash. He was attired in what apparently was a British uniform which had the words 'Royal Flying Corps' worked on the collar. I am free to say that I was not well impressed with the personality of the man, and spoke of my feelings to several members of the Club on the day he visited there, but, on the face of it, everything appeared all right, and the story was too good to pass up lightly. Over here, we are not very familiar with your military regulations, and the wearing of a uniform signified nothing. It is a common sight to see foreign officers, in uniform, in New York.

"I can understand your viewpoint, nevertheless, and assure you that nobody is more loath to print anything that possibly could advertise a faker than I am. The history of aviation is too full of that sort of business already. If you will take the trouble to follow the "Tribune," I think you will find few instances where we are misled. A few days ago, I had luncheon with Orville Wright, and spoke to him of the matter. He recalled that the Wright representative, Griffith Brewer, had written him something of the alleged Captain Janney, about six months ago. If you will interview Mr. Brewer about it, perhaps some light will be thrown on the activities of the gentleman in question.

"It is a pity that there is so little communication between aeronautical writers in England and the United States. If there were more, doubtless fewer fakes would creep into the news. On my part, I should be glad to co-operate in any way to aid in stamping out questionable firms and individuals. In justice to me, I feel that you should publish my attitude as contained in this letter. You may use as much or little of it as you like. And I trust you will understand that I am for the legitimate and healthy extension of aeronautics and am anxious to do everything possible in the line of exposing frauds. (Signed) "Gordon Bruce."

[The writer desires to thank Mr. Bruce for the attitude he has taken up on this subject, and assures the Press of the United States in general, and Mr. Bruce in particular, that he will always be happy to co-operate in any action which is for the good of aviation. The United States offers a vaster field for the development of aeronautics than does almost any other portion of the world, and it is to be hoped that the American aviation industry will be placed on such a sound footing by the orders it is now receiving from the Allies that when the war is over it may progress on thoroughly sound lines.— C. G. G.]

### CANADA.

It is reported in "the Canadian Press" that a novel use of the aeroplane is under consideration by owners of sealing vessels, as a result of the failure of the seal hunt this year.

It is proposed that two experienced aviators be engaged to visit the east coast and the gulf of St. Lawrence respectively, just before the opening next season, and locate the herds. The information thus obtained would enable the fleet to sail directly

## Notes on "Civil Aviation"

for the scene of the hunt, instead of spending much time in searching for the animals.

\* \* \*

From the "Brandon Weekly Sun," Toronto, Ont., May 6th: Vice-Admiral Kingsmill has accepted fourteen students for the Curtiss aviation school, which starts instruction this morning at the western sandbar of the island. Graduates will be given commissions with the British Aviation Corps. [One gathers That this school is officially recognised and is in charge of Mr. J. A. D. MacCurdy. . Apparently it has no connection with "Captain" Janney.—Ed.]

\* \* \*

A correspondent writes, regarding the number of aeroplanes in Canada, that there is one Curtiss pusher biplane somewhere around Vancouver, B.C , and an old Henry Farman box-kite pusher near Winnipeg, Manitoba. Mr. \\\ iUiam H. Deans, of Toronto, Ontario, has a 1914 model Ctirtiss living boat. There is also a pusher hydro-aeroplane at Brockville, Ontario. Also a hydro-biplane owned and built by Messrs. Bead Bros, of Montreal, also a Bl ^ riot XI with 50-b.p. Gnome, owned by a French Canadian in the same city. The only one of these in use to-day is Mr. Deans' CurtisS flying boat, which in the hands of Mr. Theo Mc Cauley, the Curtiss Instructor, did a lot of flying on Lake Ontario, also two flights between Toronto and Hamilton.

Mr. Deans has opened an aviation school in Toronto with Mr. James A. D. McCurdy as instructor. The latter, the correspondent says, "was formerly with the Curtiss Aeroplane Co. of Hammonds-port, N.Y. He was also connected with Dr. Alexander Bell in his experiments an the early days of aeroplanes."

One is glad to see from the above that Mr. McCurdy is not connected with the swindler "Captain" Jannev, as certain Canadian papers stated.

\* • •

The "Toronto World" has been reading about Capt. Janney in The Aeroplane, and as a result the following appears on the front page of the issue of Thursday, May 6th :

—

What standing has Janney as flying teacher?

Does man who is conducting aviation school hold credentials?

Aeroplane's views - Official magazine picks New York interview all to pieces.

[Down to "pieces" all are headlines.]

What is the status of Capt. E. L. Janney of Galt, Ont., who is conducting an aviation school in Toronto?

Is Capt. Janney recognised by the Militia Department?

Does he hold a pilot's certificate?

Is Capt. Janney authorised to charge \$500 tuition fee to would-be airmen with the promise that after a nine months' course they will be refunded this amount along with \$125 bonus ?

[These last four demands are in display print.]

Judged by his optimistic talk, Capt. Janney appears to hold the key to the R.F.C., to be grasped by all pupils who wish to put up the sum of \$500. Capt. Janney came to Toronto more than two months ago from England and supposedly France.

On reaching New York he gave an interview to a newspaper man, which was published in the "New York Tribune" and the "Toronto World," regarding the establishment of a flying school in Toronto.

His statements have since been contradicted by The Aeroplane, a British periodical devoted to aeronautics.

This publication states that Capt. Janney 's views are slightly lop-sided or words to that effect.

Capt. Janney is an aviation enthusiast.

For some little time he conducted a motor garage in Galt, Ont.

A few weeks after the outbreak of war he got into communication with the Minister of Militia when the first Canadian Division was being mobilised at Valcartier, offering his services as an aviator.

At that time he was in New Bedford, Mass.

He told General Hughes that Iv; would fly to the camp.

At Sorel his machine broke down and he was arrested.

The authorities in that town had probably never before seen an aeroplane, and at that time the country was practically in a state of war. . "About two days before the boats left Quebec the aviator arrived accompanied by another airman named Webster.

It has been said that Webster handled the machine and that Capt. Jannev was merely a passenger.

Capt. Jannev was attached to the Headquarters staff and went to England on the steamer "Franconia" in one of the convoys.

When the contingent arrived on Salisbury Plain the officer (Capt. Jannev) was still attached to headquarters.

He, according to himself, "was to be in command of the Canadian Flying Corps" which was about to be established.

Lieut. W. F. (WILLIAM FREDERICK) Sharpe of Ottawa, who was killed a few weeks later (February 1915) while trying out a new machine at Shoreham Camp, and Lieut. Farr, a mechanic, were also to be in the flying corps.

For several weeks it was understood that Capt. Janney was negotiating with Ottawa with the intention of establishing a full flying corps, but, according to the Commander of the Department of Militia, balked at handing over \$120,000 which would have been the expense entailed.

## Notes on "Civil Aviation"

When Ottawa refused to lay aside this amount it was generally thought that the two Canadian aviators and the mechanic would become attached to the R.F.C.

1. Lieut. Sharpe, who (also) was an enthusiast and had some experience in California and other States, was killed,
2. Lieut. Farr joined the R.F.C.
3. Capt. Janney returned to Canada. Why did he return?

These are the facts :

In the latter part of December or early in January Capt. Janney obtained leave for a few days.

He said he was going to London and then France.

He was away from Salisbury several weeks, having overstayed his leave for some little time.

He was next heard of at Shoreham Camp, where one of the big British Army flying schools is located.

According to reliable information, he was parading about as a staff-major—one step above his own rank—and wearing the accompanying red lapels and staff badge on his service cap.

British officers, it seemed, could not quite swallow Janney's flamboyant utterances and sent an inquiry to the Canadian Headquarters.

As a result Janney immediately returned to Salisbury.

Very shortly after, his name appeared in camp orders to the effect that "he had been cut off the strength of the force".

Despite these facts, Janney, who was not wanted in the Canadian Division, is now in Toronto making an attempt to conduct a flying school—no flights have been made as yet - and to teach would-be aviators at \$500 each.

He obtained the use of property in N. Toronto, and it is also understood that he got some financial backing in order to establish his school.

The following article, which appeared in the British flying authority, *The Aeroplane*, in view of the above facts, is interesting.

[Then follows the whole of the notes on Janney which appeared in this paper. It is to be hoped that Janney is now "down and out".—Ed.]

• \*

The following extract from the "Daily Colonist" Victoria, B.C. may be only an echo of Janney, but if not the Admiralty would do well to explain itself, for the arrangement seems unusual.

No opportunity is offered in this country for "enlisted men" to receive \$375 dollars (; ^ 75 ^ il they become pilots at their own expense.

The extract runs :— "Ottawa, April 23rd.

The Department of Naval Service has received over seventy-five applications in response to the appeal for Canadian recruits for the army flying service, Ottawa sharing with Toronto the honour of providing the largest number of would-be airmen. Mr. J. A. D. McCurdy, the expert who will supervise the training of the new men who are accepted, and who is authorised by the British Aero Club to grant pilots' certificates to recruits who show themselves qualified, has been in Ottawa for a couple of days.

"This training is being done at the expense of the recruits themselves, who, if accepted for service, will receive practically the whole cost of their training back as a grant from the British Admiralty.

[Why should the Admiralty pay for men for the "Army flying service?"—Ed. -*Aeroplane*.]

"All applicants will have to pass a medical examination by a board of examiners, and once he has passed the board he is an enlisted man, subject to discipline and under the control of the British Admiralty.

"The Canadian naval service department is acting as a recruiting agent for the British Government. Volunteers under 30 years of age are called for, and if accepted by the medical examiners are trained by the companies' teachers at a cost of \$400 each. This fee is paid by the pupil, but the money is refunded to the amount of \$375 by the British Government when he reports in England. When the pupil has been granted his pilot's certificate by the school, he is sent to England for further training, and his fare (to England) is paid by the British Admiralty." [Candidly we do not believe it.—Ed. *Aeroplane*!;.]

» »

A Canadian in Government employ writes :—"I knew an E. L. Janney who owned a garage in Gait, Ontario. He owned it for about eight months then collapsed beneath a pile of hotel bills accumulated in New York, Toronto, Buffalo, etc..

The last time I saw him he was racing from Galt towards the American line.

I learnt afterwards that he was in the hands of the police.

After the bankruptcy proceedings I lost sight of him.

[Evidently the same Janney who bluffed the Canadian Government and the Aero-Club of America, but not the simple-minded

## Notes on "Civil Aviation"

British officer-aviator. This Janney has now been fairly effectually exposed, and one hopes it will not be necessary to refer to him any more.—Ed.] Aeroplane 09 June pg 589-592

A Canadian reader of "The Aeroplane" writes :—"I have been a reader of your magazine for a considerable period, both at home and abroad. I have been very much absorbed in some of your topics, and amused at some of your jokes, but I can truthfully say that when I read the account re Capt. E. L. Janney under the 'Canada' heading, I was amused and interested at the same time."...

The writer of the letter goes on to state that the original Canadian Flying Corps was composed of three men:

- 1) Capt. Janney,
- 2) 2) Lieut. Sharpe (who was killed at Shoreham last month), and
- 3) 3) Sergt.-Major H.A. Farr ;

also there was a Burgess-Dunne biplane, good for at least 40 m.p.h. in a calm.

This machine now reposes in a shed on Salisbury Plain, and is not even a vision of its former self, not (even) through any accident, for it has never been flown in England, though it flew much in the United States, being used by the Burgess Co. as a demonstration machine for "---steen years," as he puts it.

There is, however, a good Curtiss O.X. motor rusting away, and only needing an overhaul.

Apart from this, the "Canadian Flving Corps" now appears to consist of the Sergt.-Major only, without an aeroplane, for the last heard of Capt. Janney was that he was on his way to Canada, as "plain civilian Mr. Janney", it having been announced in orders that he had resigned his commission.

It is stated that

- 1) he was never in the R.F.C.,
- 2) 2) he has never flown in England—not even as a passenger, and
- 3) 3) he has never been "on service" on the Continent.

There seems to be an idea in Canadian circles that the R.F.C. will not undertake to train any more Canadian aviators since the death of Lieut. Sharpe. - Source : The Aeroplane, 10 March 1915, pg 230.

Interestingly, the records for Sergt.-Major Farr, a man who was known to have joined Capt. Janney's "Canadian Aviation Corps" and who was from British Columbia.

A little effort and some digging thru the "Old Paperwork" records of the Commonwealth Forces of WW1 revealed the following facts about "Sergt.-Major Farr" :-

S/Sgt. Farr, Harry Arthur ser. no 1840 (File # 5755-H22) - Aviation Corps - seconded (from what?) ,

Date of enlistment "For the Duration of the War" with the "Flying Corps" of 22 Sept. 1914.

Examined in Valcartier, Quebec on 23 Sept. 1914 (where his weight was measured to be 130 lbs)

Came "On-Strength" on 7 October 1914.

His official record reveals that after serving 91 days with the "Flying Corps" at a pay rate of \$1.80/day he was "Discharged - England, due Flying Corps being Disbanded" effective 7 May 1915 (stamped by the Sub-Record Office, Canadian Contingent) and his discharge papers reflect his home address as "Qualicum Beach, BC".

His personnel record at the time of his discharge from the British Army - Div. HQ in Thorncliffe, UK as an "Aviator" reflects he was born in Dunstall, East Staffordshire, England, and was 27 years of age, stood 5'-3" had grey eyes, black hair and was of dark complexion and of "Good Character" (his penmanship was also excellent!) as witnessed by a Captain Kirkby.

The British Army records that reflect this data are Form #'s B103, B178, B268, 495-DP-100M-6-19, W-22-100M-7-18, 200M-2-21.M, W2589. His record also reflect that he was also mis-named in the paperwork as "Farr, C" which may have meant "Farr - Canadian"... and yet in Canada NOTHING is known about this particular gentleman ... and he is forgotten.

Earnst Lloyd Janny / Janney

Spouse Pearl Margaret Metz 1886–1928

Birth Day & Month:	16 Jun
Birth Year:	1893
Birthplace:	Ontario
Relation to Head of House:	Son

## Notes on "Civil Aviation"

Father's name:	William Janny
Mother's name:	Elizabeth Janny
Racial or Tribal Origin:	English
Nationality:	Canadian
Religion:	Methodist
Province:	Ontario
District:	Waterloo (south/sud)
District Number:	122
Sub-district:	Galt (Town/Ville)
Death Date	12 Apr 1941
Death Place	Winnipeg, Manitoba, Canada

23 June 1915 : Under the heading of "Here's some news that we have missed," the "Calgary Herald" tells the following extraordinary yarn :—

•

Buffalo, May 27th, Lieut. E. H. Bequer of the British Royal Flying Corps explained this morning the flight over Buffalo of an aeroplane seen by hundreds three months ago.

Lieut. Bequer admitted he had piloted the machine, starting at night from an English transport twenty miles off Long Island for his cross-country flight to Vancouver. He landed only once in the United States two hundred miles north-west of New York, because of engine trouble. He said he passed over Buffalo at a height of 3,000 feet, about daylight. " His flight over Canada, made in four days, was uneventful, and his orders sealed the lips of Canadians at the few points where stops were made.

This absolute secrecy, he said, was to enable him to check (Stop) the plot to bombard Vancouver from an aeroplane to be released from a German vessel in the Pacific.

Secret service men, he declared, in the Canadian seaport unearthed the plot through conversation overheard among German citizens.

"I had been there three days," said Bequer, "waiting at my station on Vancouver Island for the threatened raid when the enemy's machine appeared and I went out to meet it. We clashed only thirty miles from Vancouver and both opened fire. "They got me in the leg. That interfered to some extent with my manipulation of the controls, but we kept at it. When another bullet struck my abdomen, however, I was beaten and flew with all the speed of my machine, landing safely. The German machine turned back to sea as [ approached land.

Bequer exhibited scars of his wounds. He arrived at the East Buffalo Stock Yards late last night with 60 horses for the British and French forces. After landing his horses in France, Bequer will rejoin the Flying Corps at the front. Questioned closely as to the truth of his claims, Bequer showed his orders and copies of reports and declared censors had suppressed all details of the trip and his battle in the air.

"When the war started," he said, when asked about the mourning on his arm, "I had four brothers and two sisters. To-day, only my mother and I are left. My father, a retired officer, and his wife are all dead—the last at Neuve Chappelle. Stray bullets got the girls, who were Red Cross nurses."

[In spite of all their alleged "cuteness," the denizens of the Western Hemisphere seem to be the most gullible people in the world. Even a European News Agency would not have dared to perpetrate a story of this calibre. There is, of course, no Lieut. Bequer in the R.F.C. — Ed.—] *The Aeroplane*, pg 656

11 August 1915 : *The Aeroplane*, pg 155 - THE GIRDER QUESTION.

When one comes to consider the building of really big machines the multi-plane has obvious advantages.

## Notes on "Civil Aviation"

Compression stresses on spars can be divided up among a number of small spars, each carrying effective lifting surfaces, instead of concentrating the whole load into the inner bays of the upper spars of a biplane of enormous span. Thus more surface can be got with far less weight.

It may be that Mr. Horatio Phillips' "Venetian Blind" type of aeroplane will still justify his faith—not, perhaps, because the number of feet of entering edge is the chief thing to be desired, but because there may be a natural limit to the depth of chord of an efficient wing, owing to some natural law pertaining to the elastic limit of air. A limit to the depth of chord seems to imply a limit to span, from pure engineering considerations, apart from the trouble in housing and handling a very big aeroplane. And limit of span and chord places a definite limit on surface, unless surfaces can be superimposed with advantage.

### DIAGONAL STAYING.

When one starts to consider really big triplanes one begins to think of machines in which both struts and wiring are abolished and their work is done by accurately streamlined steel tubing placed diagonally.

An attempt in this species of staying" was made in an Albatros at the Paris Aero Show of 1912, but it was not worked out properly. Anyway, in small machines steel tubes have to be so light that they are always in danger of buckling from local stresses, such as a clumsy workman dropping a spanner, or a collision in the air with a bird (which has actually buckled a steel-tube strut in a seaplane) to my knowledge. But when one comes to big machines in which a certain amount of metal is necessary to take big flying loads, that amount of metal may be so disposed as to take local stresses as well, and then we come to the period of proper engineering construction and something like all-round efficiency.

01 October 1915 - The Aeroplane, pg 402 : A SELF-CONSTITUTED INSTITUTION.

The following notice, which appeared in the "Times" of October 1st, will be read with interest by all, and possibly with amusement by some, concerned with the Flying Services and the aircraft industry :—

At a meeting held at the Royal Society of Arts yesterday, over which Sir William M. Ramsay presided, it was decided to inaugurate "The Aeronautical Institute of Great Britain," which will have three principal functions:

1. aircraft production,
2. aeronautical progress,
3. aeronautical propaganda.

The first work of the Institute will be to develop its first function of aeronautical production by the establishment of an Aeronautical Production Committee.

The proposed method of working such a Committee was explained by Colonel F. N. Maude and Mr. L. Blin Desbleds. It will aim at immediately increasing the country's rate of aircraft production mainly in the following manner, which, it was declared, would interfere with no existing arrangements, Governmental or other :

- (i) To organise a Central Bureau which would render possible the (voluntary) co-operation and co-ordination of the aeronautical industry, thereby enabling the execution of larger orders than is at present the case.
- (ii) To give the financial institutions of the country special technical assistance not otherwise obtainable, thus linking up finance with the aeronautical industry and thereby further increasing production.
- (iii) To make arrangements for the best utilisation possible of the existing labour, and for the training of as many men for aeronautical work as the situation demands.

The whole function of the Institute will be during the war to speed up production by organisation in every direction.

The meeting was well attended, and among those who had accepted the invitation to be present were :

Sir Frederick Pollock, the Hon. W. P. Schreiner (High Commissioner for the Union of South Africa), Professor W. C. Unwin, Sir Philip Magnus, M.P., Sir Charles Macara, Sir George Taubman Goldie, Mr. W. Nelson Mitchell (chairman of the Imperial Tobacco Company), Sir Leo Chiozza Money, M.P., Mr. Charles Bright, Sir Alfred Pearce Gould, F.R.C.S., Sir R. W. Burnet, M.D., Lord Hill, Lord Claud Hamilton, M.P., Mr. Basil Peto, M.P., Mr. A. S. E. Ackerman, Mr. Robert Mitchell (Director of Education, the London Polytechnic), Sir Alexander Pedler, and Mr. Evelyn Wrench (hon. secretary and organiser of the Overseas' Club).

The idea of co-ordination and co-operation in the aircraft industry is an old one. It was suggested in this paper some months ago, and when the Aero-Committee of the Society of Motor Manufacturers and Traders was formed some years ago the germ of the idea existed.

Apparently, the aircraft industry does not desire cooperation in any form, any more than does any other English industry. Free competition between firm and firm, on a more or less friendly basis, seems to be inherent in the English mind. Even agricultural cooperation does not flourish in England, and makes greater proportional headway in Ireland—in the latter country this may be accounted for by the fact that co-operation partakes of the nature of conspiracy, and

## Notes on "Civil Aviation"

so fits the Celtic temperament.

One may coerce an Englishman, or discipline him, or cajole him into following a leader, but one cannot persuade him to co-operate voluntarily with his fellows, possibly because of that intense individualism which makes it an article of faith with every Englishman that he is "as good as the next man, and a damned- sight better"—as a workman once put it to me. That is why Saxon England was a Heptarchy—which was much the same as an Anarchy—in the period between Roman coercion and Norman discipline. Therefore, one may wash out any idea of co-operation in this or any other industry, unless co-operation is forced on industrial England by the Government.

### THE RIGHT PEOPLE.

However, as regards the Maude-Desbleds effort, it seems at best unnecessary. At worst, it is an impertinence. For, apart from the fact that no one whose name has appeared in connection with it has any obvious qualifications to teach either the Government, the industry, or the workman, anything connected with the use or construction of aircraft, there already exist bodies which could do the work if it were needed. The Aeronautical Society is the recognised technical authority, and though it has been in a state of suspended animation since the outbreak of war, it can be resuscitated whenever it is needed. I believe that the Secretary is employed in the Censor's department with special reference to aeronautical work—if so, I am sure he makes an excellent censor, for he certainly knows the technical end of his job—but if the Government needs a Central Bureau to "render possible the cooperation and co-ordination" of the industry, he can run it from the Aeronautical Society's office better than anyone connected with the grandiloquently self-styled "Aeronautical Institute of Great Britain."

Somehow, that title sticks in one's gullet. It reminds one of Patent Teeth Institutes, and Massage Institutes, and Institutes for supplying Trusses for the Ruptured, and Crutches for the Crumpled, and such things : Institutes which look like charities till one finds that they charge more than ordinary dentists, doctors, and shops, and do not give as good value even then. On the whole, I think the aircraft industry will do well to fight shy of the "Aeronautical Institute of Great Britain" till it can prove that it is not merely supported by fumistes and "limeighters," and is a serious scientific institution approved by those controlling the Flying Services, and regarded with favour by the Councils of the Royal Aero Club and of the Aeronautical Society. Meanwhile, it had better be left to work out its own salvation, or damnation.— C.G. Grey.

### 30 June 1915 : England : THE REPORT OF THE ADVISORY COMMITTEE.

The (Imperial British) Advisory Committee for Aeronautics issued its report for the year 1914-15 last week. Owing to the war it is natural that little definite information should be given, but the general lines on which research is being carried on are of interest to those concerned with aviation.

The ACA Report states that

1. during the absence of Major-General Sir David Henderson on active service, Colonel Sefton-Branker, Deputy Director of Military Aeronautics, has acted as the representative of the War Office.
2. Continued progress has been made during the year in the consideration of the stability of the aeroplane.
3. A large amount of attention has also been given to improvements in details, both aerodynamically and constructionally.
4. Important additions have been made to the equipment of the National Physical Laboratory.
  1. The large air channel (wind -tunnel), 7 ft. square in section, has been completed, and is in use - an air speed of 65 ft. per sec. (roughly 44 m.p.h.) can be reached. The work done in the air channels has included tests on:
    1. models of airships, and airship appendages,
    2. aeroplane wings, bodies, fins and rudders, tail planes and elevators, struts, wires and other aeroplane parts, and on
    3. models of complete aeroplanes.
  4. Investigation of the stability of the aeroplane has been extended to the case of a machine turning, whether moving in a horizontal plane, or in a spiral path. The analysis involves the solution of algebraic equations of the 8th degree, and the methods applicable to the solution of such equations have been developed with a view to the reduction of the labour involved. The machinery thus provided will, it is hoped, be of assistance to other workers on the subject.
  5. Interesting results have been obtained as to the influence of turning on the longitudinal stability, and on the tendency to the form of instability known as the "spiral dive."
  6. Some of the experiments on complete models in the air channels have been directed to obtaining data required in connection with these investigations relating to stability, and for the design of the controls.

## Notes on "Civil Aviation"

A large amount of this work has been carried out at the request of the Admiralty and the War Office, to supply information needed for improvements in the construction and design of machines. Systematic research has been continued to secure increased aerodynamic efficiency in all parts.

2. In connection with the researches on light alloys, a rolling mill has been provided at the National Physical Laboratory, to enable the practical working of light alloys to be studied.
3. Apparatus for tests of air-screws in the wind channels have been installed.
4. Apparatus for tests of new (landing) gear and attachments for tests of seaplane floats in the William Froude National Tank have been installed.
5. Apparatus for strength tests of large samples of aeroplane and airship fabric have been installed.
6. Further tests on air-screws have been made on the whirling arm, both for the Admiralty and for the War Office. These tests have brought out points of importance, and experiments are proposed with a view to the improvement of the methods of calculation applicable to air-screws and to securing a means of predicting more accurately the performance of an air-screw under various conditions of use.

In continuation of the inquiry into the strength of aeroplanes, methods have been devised for the calculation of the stresses in the wings and bracing of aeroplanes, and have been applied to the determination of the stresses occurring in special types of machine. The methods of calculation applicable to more rigid structures require modification in relation to so flexible and elastic a structure as that of an aeroplane, and the method of "strain energy" has been developed and applied for this purpose. It is hoped that the results of this work will be of assistance to designers.

At the request of the Superintendent of the Royal Aircraft Factory, experiments have been made on the fatigue strength of stranded cables, passing over pulleys of relatively small diameter.

By desire of the War Office an investigation has been undertaken with regard to autogenous welding, and the precautions to be observed in its employment in aeroplane parts.

Fatigue tests of a wing spar which have been in progress over a considerable period have recently been completed.

A large number of cases of fracture of aeroplane parts, especially of parts of engines, have been investigated at the request of the Admiralty and of the War Office. It has led in many cases to suggestions for improvements in design which have been brought to the attention of manufacturers and have, in some instances, revealed undesirable variations in the composition of the materials employed in manufacture.

Tests have been continued in the William Froude National Tank on models of floats for seaplanes, and improvements have been made in the methods of tests and the apparatus employed.

Useful information has been obtained from experiments carried out by the Admiralty on machines 'fitted with floats designed in accordance with the results obtained in the model tests, and the report made to the Committee by the officer who carried out these experiments emphasises the value of the investigations made in the tank.

An increased volume of work has been dealt with relating to airship and aeroplane fabrics, methods of proofing, dopes, etc. Special attention has been given to the strength required in aeroplane fabrics, especially under the conditions of service and exposure. The stresses which may occur in the fabric on the wings of aeroplanes under various conditions have been more fully investigated, and a series of bursting tests on aeroplane fabrics has been carried out for comparison with the results obtained from tensile tests.

The Committee desire to thank Mr. T. Jackson Greeves, of the Port-down Weaving Company, Limited, for assistance in these tests. Investigation as to "deciding upon standard conditions in tests of fabrics", especially un-doped fabrics, has been completed, and it has been possible to specify conditions for the contractual testing of aeroplane fabrics which increase rapidity of test and uniformity in results. These conditions have been adopted as standard for War Office specifications.

Other matters under consideration by the Committee include sighting appliances for use on aeroplanes, and accuracy i.e. bomb-dropping. Special investigations for the Admiralty and the War Office include the analysis and examination of deposits on airship envelopes, and tests of magnetos for wireless installations to determine their liability to ignite explosive mixture\* of gases.

A report on Gyroscopic Theory has been prepared by Isir G Greenhill, and was issued in December last. Full Scale Work at the Royal Aircraft Factory.

The investigations at the Royal Aircraft Factory of design of new or modified types of aeroplanes, and improvement of existing types, have been closely related to military requirements.

## Notes on "Civil Aviation"

In particular the theoretical study of stability, and experiments on models associated therewith, has been tested and demonstrated on full scale aeroplanes.

Reports from the Expeditionary Force have indicated:

1. the advantage of attention to strength in all "details" of aeroplanes, and
2. the advantage of attention to good construction in all "details" of aeroplanes.
3. in consideration of flattening out after a steep dive, the "margin of strength exceeds that specified as required" in all machines now designed.
4. The consequent increase in weight has to some extent been compensated by other improvements, and by increased aerodynamic efficiency.

In military use, further increase in strength has to be considered in relation to other factors affecting safety, in particular the merit of rapid climbing tends to safety of a different kind, and limits the increase in strength and weight which might otherwise be adjudged desirable. [That is to say, there needs be a "factor of safety against being shot" owing to inability to climb to a safe height, as argued long ago in this paper.—Ed.]

In accordance with suggestions made by the Committee to the War Office, the use of autogenous welding (where no additional filler rod is used and the weld is formed entirely by melting the parts together) has been dispensed with (stopped) in the manufacture of parts under stress.

Many other matters of detail, both in design and in construction, as affecting strength have also received attention.

Tests of new designs have shown that it is possible, without sacrifice of controllability, to make the aeroplane inherently stable and capable of flying satisfactorily without use of the controls.

Improvements have been introduced in:

1. the shape of the body and engine covering,
2. in tank capacity,
3. in the x-section and attachments of wires, and in
4. many other ways.

Experiments on alighting gear have been continued, and two standard types adopted as suited to special requirements. [Can this mean the simple V chassis to increase speed?—Ed.]

New types of machines have been designed embodying "special features" which recent military experience has shown to be desirable. In all of these it has been found possible to secure stability under ordinary conditions. [Possibly the big fighting machines mentioned by Mr. Tennant.—Kd.]

Wireless and other signalling apparatus has been designed, and bomb-dropping gear has been fitted and investigated. Experiments with engines have been continued, and four types of engine for different purposes have been designed [By the R.A.F., which denied that it was competing with engine makers? —Ed.] and are being produced by various manufacturers for use in standard aeroplanes. Much work has also been carried out in conjunction with makers of other types of engine in this country, and the experience gained in the testing and repair of engines used on service machines has thus been rendered of material assistance in the improvement in detail of existing types.

Increased accommodation has been provided for in the instrument department.

The work of the factory in this respect involves a considerable amount of routine testing' of instruments for use on aeroplanes, which can now be dealt with more rapidly.

Improvements have been made in the standardisation of dimensions and methods of attachment of instruments, so that those of different makers can be readily attached to standard instrument boards or supporting panels.

Attention has been given to the clear marking of, and to the lighting of, instruments, and a dashboard lighting set has been produced.

A thorough investigation has been made into the sources of compass error on the aeroplane, and a full report on the work has been presented to the Committee.

The manometer and recording instruments for tests of full-sized air-screws on the whirling arm have now been fitted, and tests have been made. Owing to shortage in the power it is not yet possible to obtain full speed conditions, but with

## Notes on "Civil Aviation"

some air-screws forward speeds of up to 55 miles per hour have been reached, corresponding with the climbing speeds of certain aeroplanes. It is hoped shortly to increase the speed.

### Naval Work.

Close co-operation has been maintained between the experimental department at Teddington and the Air Department of the Admiralty.

The Committee is indebted to the Air Department for assistance and information with regard to work on airships and aeroplanes, in relation to the experimental investigations on models.

The Committee has received from the Air Department requests for investigations of the air pressure on airship sheds, tests of wind-screens, investigations relative to fabrics, and to the material and design of parts of aeroplanes and of engines.

In July, by invitation of the Air Department, the Committee visited Naval Air Stations to inspect naval airships, naval aeroplanes and seaplanes, and to examine certain questions on naval machines in flight.

At the end of 1913, the experimental work in meteorology was moved from Pyrtton Hill to new quarters in the Royal Aircraft Factory at South Farnborough. This involved the organisation of an observing station for obtaining continuous records of pressure, temperature, humidity, rainfall and sunshine, with regular observations for the purpose of control, of frequent observations of air currents at different levels by means of pilot balloons, and of arrangements for the supply of charts, forecasts and other information to the Aircraft Factory, and to the naval and military wings quartered at South Farnborough.

The Commandant at Upavon has arranged for the reciprocal checking by the meteorologist at each station of the special forecasts issued by the other.

The Meteorological Office at South Farnborough is administered as a branch of the Office at South Kensington, and its normal staff consists of:

1. a meteorologist provided by the Meteorological Committee,
2. a professional assistant provided through the Advisory Committee, and
3. a boy provided by the War Office.

Further progress with experiments in meteorology has, for a time, been postponed. - The aeroplane 30 june pg 689.

10th August 1915 : Maurice Baring : RFC HQ : When General Trenchard took over, the R.F.C. consisted of three Wings and a Headquarters.

The first thing Trenchard wanted Baring to do was to make notes for him.

The General's system of note-making was like this.

1. He visited Squadrons or Depots or Aircraft Parks as the case might be and took someone with him who made notes (for the next four years the someone was Baring) of anything they wanted.
2. In the evening the notes used to be put on Trenchard's table typed, and then he would send for the various staff officers who dealt with the matters referred to in the notes, and discuss them.
3. The first thing Trenchard would ascertain was if the matter mentioned in the note had a real foundation ;
4. for instance,
5. whether a Squadron which complained that they were short of propellers had not in fact received a double dose the day before.
6. If the need or the complaint or the request was found to be justified and reasonable Trenchard would proceed to hasten its execution and see that the necessary steps were taken.
7. If the requests were found to be idle or baseless the Squadron or the petitioner in question would be informed at once.
8. But where Trenchard differed from many capable men was in this :
9. he was never satisfied with investigating a request or a grievance or a need or a suggestion.
10. After having dealt with it he never let the matter rest, but in a day or two's time he would insist on hearing the sequel.
11. He would find out whether Squadron B had received its split pin or what Mr. A. had answered from England when asked for it.

This did not conduce to our repose, but it did further the efficiency of the R.F.C.

The first long expedition Baring went with Trenchard was on August 22nd to the Third Army, where they visited No. 8, No. 4 and No. 12 Squadrons. But the first notes were made the 24th of August, when they visited the first Wing. Baring's note-book for that day reflect:

1. Trenchard wanted Oxford marmalade for breakfast (there was Oxford marmalade for tea on Trenchard's table the next day)
2. the road near No. 3 Squadron is too dusty, and steps must be taken to remedy this.
3. the first Wing are not to press at present to send observers home to learn to fly.
4. Christie wanted more double clips for the elevator control.

## Notes on "Civil Aviation"

5. There is also something not quite legible with reference to R.A.F. wires and
6. Crossley spare axles.

The General never referred again that year at least to his initial talk with me as to whether I should be of use to him or not, but when on the 24th of August, the day after he said he liked Oxford marmalade, there was Oxford marmalade for tea, he said to me, looking at it : "I see you have got a memory ; I shall use it."

The men of the RFC missed General Henderson very much, and the General told me he missed his influence with the armies. The Coldstream Guards were billeted quite close to us on the road to Boulogne at this time.

Baring's nephew, Dermot Browne (killed at Loos on September 29, 1915) who was in the Coldstream Guards came to dinner with us, with John Ponsonby, who almost immediately after this became a Brigadier, and one night I had dinner at his Headquarters.

On September 2nd Baring went with Trenchard to Paris.

I Baring's notes reflect : "must bring back some paper felt washers for induction pipes of Le Rhone engine"

They went to the Paris Aviation Office and afterwards to Darracq's Works.

Trenchard had an interview with General Hirshauer, who commanded the French aviation On September 3nd, but he went with Colonel Leroy-Lewis, the RFC military attache, and Baring was not present.

They also went to the Morane factory, returning to St. Omer on September 5th, stopping at one of the Squadrons on the way.

In September 1915 the RFC had one Aircraft Park to supply the needs of the Squadrons in the field. It was scattered about in various places at St. Omer. Trenchard's idea, which he carried into effect shortly after this, was to have one Aircraft Park for the Squadrons serving each Army what were afterwards the Brigades.

We went over. Baring's notes of the visit to the Aircraft Park on September 8th reflect that the Banjo clearances were wrongly adjusted when they came out.

The next day the two Wing Commanders, Colonel Ashmore and Colonel Brancker, came to luncheon, and we went to the Aircraft Park with them.

On the 21st the bombardment began. I went with the General to all the Squadrons in the first Wing.

We visited seven Squadrons, two Wing Headquarters, and one Aircraft Park.

It was an exhausting day, and produced a harvest of notes.

Baring's notes of the 21 September visit reflect :

- A. No. 1 Squadron want a Le Rhone false nose-plate, complete, with pinion and ball-bearing.
- B. No. 2 Squadron have no V-typed under-carriages in the Squadron.
- C. No. 3 Squadron wants Ball-race No. 25 x 55 x 21 J for false nose.
- D. No. 6 Squadron want:
  - A. oval tubing-steel, 3/4 - 3/8
  - B. a front left-hand top-centre section of Fish-plate for a F.E. 2.A.
- E. No. 10 Squadron :
  - A. leave their machines out in the sun.
  - B. One machine, which was shot, is hung up for a cross-tube, under the fuselage, holding the sockets of the bottom-plane.
- F. No. 16 Squadron want fish-tail clips, and hot air-pipes for the Zenith carburettor.

Baring's notes of 22nd September reflect arrangements were made about wireless:

1. valve-prefixes,
2. shortwave- tuners,
3. the tactical call,
4. the sterling-set transmitter,
5. the short-wave tuner, etc.

## Notes on "Civil Aviation"

On the 9th of October, in the afternoon, we had a glorious exhibition of machines. Each squadron sent a machine fitted up with its pet gun, mountings, and gadgets and one got the prize.

The following questions were dealt with :

1. Bomb sights.
2. Camera.
3. Incendiary bomb-tubes.
4. Wireless reel.
5. Bomb-barrier fittings (standard position close to fuselage).
6. Release gear (cam gear for releasing bombs).
7. Gun mountings.
8. Ammunition.
9. Wireless accumulators.
10. Wireless instruments.
11. Signalling keys (they must be inside **radio box** ?).
12. Heating of carburettor.
13. Holes in planes.
14. Colour of cowl.
15. If / when extra tanks are carried: petrol, oil, pump, instruments, control pillar.
16. Map case.

On the 21st of October Baring went on leave and stayed in London, returning to St. Omer on the 28th. The Fokker scourge was at its height. Baring notes that "The Germans had made an exact copy of a French Morane monoplane, and were using it with deadly effect against RFC B.E.'s, which continued to do the work of the Army. By this time the RFC was so used to doing what it wanted in the air without serious opposition that not enough attention was paid to this menace and in the hands of a pilot like Immelman, was a serious and disastrous factor for the RFC.

The RFC never stopped in spite of this. The work of the armies was done, Fokker scourge or no Fokker scourge. It may be asked why the RFC had not got the equivalent of Fokkers for: offensive purposes by this time, and in great quantity by this time.

Baring's notes on this question reveal:

1. Using Morane types in defence against Fokkers would have been useless.
2. When England went to war she had only a partially ready Flying Corps
3. a great deal of the most important components of the RFC aircraft were made in Belgium or in Germany.
4. Until the outbreak of the war England obtained all her magnetos from Germany. England then not only "had to make magnetos" when the war broke out, but she also had to "learn how to make them".
5. In aviation during the war everything was a compromise between progress and supply
6. it took nine months for anything new in the shape of a machine or an engine to be available in any quantity
7. it generally happened that by the time a machine or an engine or the spare parts of both were available in sufficient
8. quantities that they were out of date.

In spite of these issues, neither then nor at any time later, did the work which the armies asked the Flying Corps to do for them relax whenever flying was possible.

Baring also notes that it was often heard that:

## Notes on "Civil Aviation"

had the authorities in England been more prompt and judicious and enterprising in their choice of the machines they ordered we should, at the outset of the war, have had an overwhelming mechanical preponderance over the Germans in the air.

that the RFC might have had the Vickers fighter in 1914 instead of in the summer of 1915, in which case our pilots could have shot down the Germans like sparrows.

Baring's notes his connections enabled him to confirm the RFC might have had the Vickers machine in 1914, and also that the Gnome monosoupape engine, which was the engine of the Vickers fighter, was not in 1914 a reliable engine. It was only by the spring of 1915 that the Gnome monosoupape engine could be used safely.

The French were in the same predicament as England.

In London people were beginning to become alarmed at our air casualties. Up till this moment there had been very few casualties in the air, less than in peace time.

On the 30th of October, 1915, a startling incident happened, of which the General, Colonel Ashmore, and myself were witnesses. The King was in France, and machines were forbidden to fly in the area over his billet. I was driving with the General to Aire, and we passed quite close to the King's billet, when suddenly we saw a Henry-Farman machine flying low without marks, right over the King's billet.

We had no Henry-Farman machines at that moment. Telegrams and messages were sent all over France to trace the machine without avail. The French knew nothing of it, neither did the Belgians. The explanation was that it was the French liaison officer who used to fly back and forth from France to England.

The problem of how to fire through the propeller was engaging everyone's attention at this time.

The question was solved for the moment by having a deflector on the propeller, off which the bullet ricocheted, when it would, without a deflector, have hit the propeller.

This system was invented by French pilot Garros and copied by the Germans. They then adopted a gun which fired through the propeller, by virtue of an interrupter gear, a system which was definitely proposed by the Royal Aircraft Factory before the war, although it did not then get as far as the drawing stage.

Our synchronising gear first came into existence in 1916. On November 15th, 1915, the first Morane biplane arrived at St. Omer, and was flown against a Bristol scout.

The General watched the two machines go up.

It was rather cloudy, and after they had been up about half an hour he began to grow uneasy.

Like all people who have an intimate experience of aircraft, he hated watching flying, and hated still more waiting for people to return. However, both the machines returned safely.

On the 8th I went with the General to London. We returned on the 15th. Nothing particular happened during the next few days, except that the first Wing was made to disgorge a clerk from their surplus, and arrangements for Christmas were made.

On the 22nd of November, 1915, I went with the General to watch experiments of bombing from the air in the Third Army, which General Allenby was commanding. We watched bombs being dropped from a machine, which went off satisfactorily and at a reasonable distance from the target. When we got back the following letter was written to the third Wing, which I quote as an example of the kind of work which used **to be done**.

H.Q., 3rd Wing. With reference to the questions raised by various officers in your Wing during my visit to-day, herewith the following remarks:

No. 3 Squadron :

V-type landing gear : 2x End sockets for strut tube, rear 5408-ii wanted. (Ordered. Further information later)

## Notes on "Civil Aviation"

Machine 4793 sent from St. O. with bomb release handle outside. (Being inquired into.)

No. 13 Squadron :

Flexible petrol tubing for extra tank. (Telegraphed for.)

No spare V. under carriages on hand (Being hastened from England.)

No 11 Squadron.

10 cwt. cable (Ordered and hastened)

December 2nd Sir William Robertson came up to look at the aerodrome and the Aircraft repairing section. We were told beforehand he would be sure to ask one question which the person asked would not be able to answer. This did occur. He asked someone what a particular propeller was made of, and the man didn't know, but had to refer to someone else.

post dec 25, 1915 : I was told I had to go to Italy again with a pilot called Cooper, who was our flying liaison officer with the French, the object of the visit being to get the Caproni machine we had ordered in the summer and to make arrangements for its being flown or sent back.

I started the next day with Cooper, and we arrived at Paris in the evening and at Turin on the following day about two. We went straight to the Aviation Headquarters, and found that no arrangements had been made about the Caproni machine. It was settled we should go to Milan. January 1st, 1916. From a letter :

... "I returned from Italy last night. It was one of the most exhausting journeys I have ever done. We motored all day to Paris, then we rushed to the Gare de Lyons, and thence rushed to Turin. Then the next morning we got up at five and went by train, changing five or six times, to Vezzola, with two Italian officers, who discussed a point of higher mathematics during the journey. We got out at Adine, hired a motor, drove across the Ticino, and for all I know the Rubicon, and the Tiber, and Lake Maggiore, through Lombarda, and Novara and Arona, to Gallerata, where the Italians learn to fly. There we inspected the Caproni machine in a shed, and saw Pinsuti, the stunt Caproni pilot, and thence we drove to Malpensa, where Dante was born and Virgil died, and there we

were introduced to 45 flying officers, who each one said his name and use and clicked his heels. Then we had luncheon with the Flying School, which was commanded by Captain Falchi. At the end of luncheon the Captain made a speech about delicious England and the adorable English people, and I made a speech about divine Italians, quoting Browning, Dante, and D'Annunzio. Then an Italian pilot called Pellegrini, Cooper and myself went up into the sky. Into the grey, misty, sunless, lampless, sullen, unpeopled sky. And, as the machine climbed, the curtains of heaven were rent asunder, and through and over oceans of mist and rolling clouds, naked, majestic, white, shining

and glorious, rose the Alps, like a barrier ; and at our feet, dark as a raven's wing, loomed the waves of Lake Maggiore, fringed with foaming breakers ; and the earth was outspread beneath us like a brown and purple carpet. And we climbed and banked, and banked and climbed, and far beneath us a little Maurice Farman fluttered like a white dove. Then suddenly the three engines stopped buzzing, and we turned and banked and turned and banked and turned and banked and dived and turned sheer and steep till we gently rolled on to the ground. January July 1916. As the prospects of receiving the Caproni machine, should it ever be dismantled, seemed remote, it was settled that the machine should be flown over from Italy by Valentine. It was flown in the course of several months as far as Dijon, where, after many vicissitudes, it finally crashed.

On the 4th, General Henderson came over from England, and on the 5th an S.E. propeller was found in an F.E. box.

Jan 6th 1916 : The next

day we started for Paris, stopping on the way at Chantilly, where we had luncheon. We went to Villa Coublay in the afternoon to see machines fly.

The next morning we went to Darracq's factory. While we were having luncheon the General got a telegram saying I was to go to London at once and report to the Foreign Office for duty. He was a good deal upset, because we had more business to do with the French, and he was without an interpreter. He said :

"Of course if they really want you at once it would be criminal not to let you go." A wire was then sent asking if the duty I was required for was permanent or not. In the afternoon we went to Puteaux and Issy. That night we dined out. I sat next to X. The General was on the other side of the table. My neighbour asked me in French whether the General wasn't very young to be a General and what his name was. I said I would write it down presently on the menu, as, although he was supposed not to understand French, he would be certain to hear. Then we talked of other things. Later on during the dinner I wrote the General's name down on the menu. He leant across the table and said : "I hope they will be able to read my name in your handwriting."

We got back to St. Omer on the 13th of January. A telegram came from London saying the duty I was wanted for was permanent.

The next day I started after luncheon for Boulogne, and only just caught the boat after the fastest drive to Boulogne I ever had (49 minutes). I arrived in London at 7, and went straight to the War Office to report.

The directorate of military aeronautics was at that time occupying a loft right at the top of the War Office called Zeppelin Terrace. Later on I listened to conversations at conferences at Versailles and elsewhere on the subject

of aviation, when a fluent interpreter who understood English perfectly would nevertheless translate a phrase relative to aviation in such a way that it meant the exact opposite of what was being said, simply from ignorance of the subjects that were being discussed. Luckily there was always someone else present, who pointed these slips out to the General and the misunderstandings were rectified, but it showed one how fatally easy it was for a conversation of this kind to go wrong when the interpreter knew French and English but did not know aviation. The next day 24 or 25 Jan we crossed to France, met General Trenchard at Boulogne, and went by train all together to Amiens, where General Trenchard and I got out. General Henderson went on to Paris. In the train the two Generals had a long discussion about the future of the R.F.C. The idea was that General Trenchard should go home as Director of Military Aeronautics and that General Henderson should go out to France and take command there. On the 25th a new French liaison officer arrived vice Philonneau, called Lt. Duclos. The next two days we spent in going round Squadrons. At one Squadron one of the pilots showed us an elaborate gunmounting of the Christmas tree kind, distractingly ingenious but a definite hindrance and handicap to the fighting efficiency of the machine, as a surprise. When the General saw it he said : "I never saw such ridiculous nonsense." On the 28th Raymond Asquith came to dinner with us. He asked the General what the truth was about some air incident about which there had been a question in the House of Commons. The General told him that in the answer given in the House the facts of the case had been stated.

"

Oh," said Raymond,

"

it was true ! I thought as it was stated in the House of Commons it couldn't possibly be true."

The General, on his birthday (February 3), spent a happy day visiting the Squadrons in what was now the Third Brigade.

The R.F.C. had now expanded from Squadrons to Wings and from Wings to Brigades. A Brigade had two Wings : a Wing of fighting Squadrons and a Wing of Artillery Squadrons. A Wing was to be elastic, and had a smaller or a greater number of Squadrons according to circumstances. But every Corps was to have an artillery Squadron to serve it. On the 6th we had a visit from Lord Curzon, who went up in a machine, and on the 8th a party of Russian pilots visited us. We showed them round, and the General arranged for them to be given some Lewis guns. On the 9th we started for London. As we were getting near Folkestone the boat stopped. A trawler had been blown up by a mine. Lord Curzon was on board, and talked of the necessity of having an Air Ministry and an Air Minister. A man, as he said, on whose broad back the slings and arrows of outrageous criticism would fall harmlessly. As we were leaving Boulogne the General got a telegram saying the French

## Notes on "Civil Aviation"

Air Minister had resigned. The next day I went to the War Office, and that night we dined with General Henderson, who gave a farewell dinner at the Naval and Military Club to Commodore Paine, General Trenchard, Longcroft, Webb-Bowen, etc. But in spite of this, all plans seemed likely to be changed, and General Henderson would probably remain in England.

We went back to France the next day, and the plan of General Trenchard being Director of Military Aeronautics and General Henderson going out to France did not take effect.

On the 20th of February, 1916, Commandant Du Peuty, of the French aviation, came to see us, and brought with him a French officer, who was to be henceforth our liaison officer with the French aviation. La Ferriere came from the French Flying Corps. His services to us proved invaluable, as he not only understood English but the English, as well as aviation, and pilots, both English and French, and he did almost more than anyone to bring about the good feeling between the French and English sendees.

Commandant Du Peuty was originally a cavalry officer. He learnt to fly after the war began, and he soon proved himself to be one of the most daring of pilots and the soundest of flying officers and organisers.

Our debt to him was incalculable, as I shall try to show later on.

Commandant Du Peuty left La Ferriere with us. The latter spoke English like a native.

Here are some entries from my Diary and from letters during March :

March 1st. From a letter :

" A British pilot shot

down a German Albatross to-day with his cross-bow.

The German was so sure of being shot down that he brought his luggage with him, which consisted of a Schnurbartbinde and a small doll's portmanteau." The new type propeller should have its nose painted green. Three of them were not so painted in No. 10 Squadron.

March 2nd. Went to 15, 5, and 6 Squadrons.

Wypers Bluff taken and counter-attacked. There appears to be a lull at Verdun. A Morane biplane has arrived. F., in talking about General de Castelnau, said every one had attacked him throughout his career.

" Mais on n'a jamais pu trouver rien contre lui sauf que c'e"tait un homme tres remarquable."

No. 6 has no gun-mounting on the top plane of the Bristol.

March yd. The news from Verdun is less good.

The Germans have retaken Douaumont. Verdun is expected to fall. No. 21 has only three sheds.

March \th. The news is better. Distilled water is being issued for compasses and accumulators. Nine Lewis guns are to go to the French.

March \$th. Gibourees de Mars. Went to Mass. A French bomb expert came to luncheon. Zeppelins reported to be about. No. 3 Squadron said a Morane

## Notes on "Civil Aviation"

pilot was lurking in 20 or 25 flying an F.E. He is to be given to No. 3 at once.

March 6th. We have got a new machine. It did its trials and climbed 6,000 feet in two minutes.

March 7th. Conference at Aire at first Wing H.Q.

It snowed all the afternoon. Heavy fighting still going on.

March 8th, 1916. Lord Derby came to see the

General. In the afternoon we went to the Aircraft

Park at Hazebrouck. We went in by the back way

through a bicycle shed. This had a roof of green Willesden canvas, worth, the General said, its weight in gold. Scandal.

As we were driving back from Hazebrouck we passed a lot of lorries parked along the road. The General said if the war is still going on this time next year, put a note on my table in a year's time, but not before, that these reserve lorries must be cut down. "

Puis se

reprenant avec sa lucidité ordinaire," as Taine said about Napoleon, he added :

"

No, not next year, but

at the end of next November, but not before."

March 12th, 1916. The General showed the Depot and the Stores to General Butler, and after luncheon the Aerodrome.

From a letter : " The Hispano- Suiza did 90 on the pitot tube. It is hoped the Le Vasseur Nieuport propeller will arrive to-morrow.

They say the engine with the silencer is faster. This is difficult to believe, but I do believe it.

She missed badly as Bettington was flying across, so he had to shut off.

The fan in the acetone dope room is out of order, so the men were told to knock off work there. In future no R.A.F. signalling lamps are to be kept at the 2nd A.P. The doping room there was not satisfactory. They were repairing a plane there, which is against orders, as it was laid down that only doping is to be done there. In the motor transport they were making water trailers for the Wings. Unnecessary !

" March 13<sup>th</sup>, 1916. The spring has arrived. A lovely day. A machine was reported to be down near Aire. I went there with the General and then to Brouay.

The uncovered wings of the De Havilland scout are straight as far as the outside strut, and then swept back.

Reading the Octave of Claudius, by Barry Pain.

March 14<sup>th</sup>, 1916. News that Victor Barrington- Kennett is missing. The third brother in this war.

March 15<sup>th</sup>, 1916. From a letter:

"To-day the Hispano got the legs of the Martinsyde with the Lang propeller. The le Vasseur propeller absorbs the power, but not the efficiency, and with it the Hispano on the B.E. beat the Bristol on the climb, but not on speed. The pitot-tube not having been calibrated, it was not reliable. An LVG, an Aviatik, and an Albatross have all found a happy home in our lines."

March 16th, 1916. Went to Bailleul, No. 1 Squadron.

From a letter :

In the back gun-mounting of the Morane biplane in A. Flight of No. 1 the taper-peg of the gas-regulator had no packing. A sergeant is to go and put it right. Also the shock-absorber on the drum of the Lewis gun, which is round, is being changed for a flat and weak one ; if this turns out to be reasonable the change must be adopted generally.

No. 7 still paint their tail planes, which is unnecessary, and makes the machine heavier.

March 17th, 1916 (St. Patrick's Day). One bicycle from the 3rd Aircraft Park, was found in the Motor Transport sheds in a filthy condition.

## Notes on "Civil Aviation"

March 15th, 1916. Some Russian newspaper correspondents came to see the Aerodrome at St. Omer. They went up in two F.E's. Some new parts arrived from Dunkirk. Had dinner at the Correspondents' billets with the Russians. Wilton, formerly Times Correspondent in Petrograd, was there.

March 18th, 1916 (St. Omer). Game arrived. He is to be G. S.O.I. He comes from a Divisional Staff, and is furious at being sent to the R.F.C.

On March 22nd, 1916 we went to Paris via the Fourth Army. The next morning, at 9.30, we went to the Air Ministry. Then to Nieuport's works, and after luncheon back to Nieuport's again to see the Acland deflector propeller device tried on a machine. It was hours before the engine started. As soon as it started, it jammed owing to the mechanic being too nervous, and the cartridges came out intact the wrong end. The General said the device would be dangerous in the air owing to the chain (Which it proved to be) We then went to Villa Coublay, where we saw Morane and Saulnier.

March 29th 1916. The cold is indescribable. It is windy, cutting, gusty, cloudy, and raw.

March 30th was the day of the great move to St. Andre. The whole house was upside down. All the clerks were busy flinging maps into cases, hammering boxes, ripping, tearing, rending canvas and other stuffs, and hurling packing cases into a lorry. Bates, the General's shorthand-clerk, went to him with a screw-driver instead of a pencil. The General, in order to escape the turmoil and confusion of the move, wisely settled to spend the day out. But before starting, we bought two stoves and two carpets for St. Andre in the town. Then we went a tour of Squadrons, and arrived at St. Andre at six, where we found everyone buzzing like bees, and the house quite comfortable.

An immense stove had been put in the hall, with a pipe which went right through the house. The General's office was upstairs with an escalier derobe leading from it to the ground floor. You could also reach it by the main staircase.

St. Andre, April 7th, 1916.

ABOUT this time one of the periodical air agitations was going on among the politicians. The worst of these agitations was that they were too late to be of any use. It is no use making an agitation for obtaining in a few days time what it takes a year or more to make. The net result as far as we were concerned I tabulated as follows in my diary on April 8th:

Results of Air agitation :

A. Positive. Not the hastening of one bolt, turnbuckle, or split-pin.

B. Negative, i. General hindering of operations in France.

2. *Danger of spread of alarm and despondency among the younger personnel of the R.F.C. - This last factor was one which never seemed to occur to anyone in England!*

On the 8th of April there was great excitement because a Fokker was reported to have made a forced landing at Renescure. The Fokker was brought to St. Omer the next day. The General went there by air, and I met him in the car. He inspected *the Fokker*, which *turned out to be an exact facsimile of the Morane monoplane.*

One of our best Wing Commanders was killed in the air just at this time, namely, Lewis. He was taking up someone to show him the line, and was brought down by a direct hit from an archie just on the other side of the line. Lewis was one of the pioneers of wireless in the R.F.C., and one of the most gallant of pilots, besides being an excellent organiser and leader.

He was a very great loss. Only the day before he had asked the General whether he minded him going up. With the Fokker which had made the forced landing there was a German pilot. In the course of time he was brought to St. Andre and interrogated by Brooke-Popham.

The pilot said he supposed we should copy the Fokker, in which case he would be shot as soon as the war was over. In the course of a conversation I had with him after his interrogation was over, he said that of course British pilots were paid for going up, and he seemed surprised and a little bit incredulous when I told him this was not so. He said the Germans had never used a Fokker with a stationary engine during the war. This was interesting, and, no doubt, true.

## Notes on "Civil Aviation"

And yet a great *many pilots were convinced that they had flown past a Fokker with a stationary engine*, which shows how deceptive appearances are in the air.

This man was a native of Berlin, a clerk in ordinary life. He had mistaken the junction of a road and a canal, lost his way, and run short of petrol.

*From a German machine captured* shortly afterwards by the French *we copied and adopted the disintegrating link for machine guns.*

One of the great difficulties experienced with the machine guns in the air was disposing of the empty canvas ammunition belts. When the gun was firing in the air the empty portion of the belt was liable to get blown about and thus affect the unused portion of the belt, and so stop the firing.

This difficulty was ingeniously overcome by building up a belt of separate metal links, which were only held up a belt of separate metal links, which were only held together by the cartridges.

As each cartridge was withdrawn from the belt by the action of the gun, the link in front of it, having nothing to hold it to the rest of the belt, simply fell off, and whether it was caught by the wind or not, could have no effect on the working of the unused portion of the belt. *Such was the device invented by the Germans which we copied.*

This is the only device we ever copied from the Germans in aircraft throughout the war.

The Fokker machine had a parabellum gun which fired through the propeller, but already in February of this year *our synchronising gear known as the Scarf-Debowsky gear was in existence.*

April 13<sup>th</sup>, 1916. Navarre, the French pilot, has brought down four Huns in one day the record so far. He is a genius. He makes rings round everyone else, and spirals down nose-diving. But he has the defects of genius in an alarming degree. That is to say, from a disciplinary point of view he is difficult to deal with in the extreme.

April 14<sup>th</sup>, 1916 (St. Andrt). We went twice to G.H.Q. in the morning. I saw Raymond Asquith. April 16<sup>th</sup>, 1916. The Fokker machine has been flown to the Second Aircraft Depot at Candas, and Commandant Fort and other French officers of the French aviation were invited to come and look at it.

The General and I went to Candas by air in two R.E.s. ; the R.E. 7. is a nice comfortable, roomy machine. It was a lovely day and the flight was enjoyable.

Patrick flew over, and ran into the General's machine on landing. He had had the most amazing adventures in the Fokker, being chased by one of our machines in the mist, and having to land in the French lines. April 18<sup>th</sup>, 1916. The General has got an A.D.C. called Pelham who has arrived.

This means that in future I shall not have to keep the Mess Accounts.

Pelham proved one of the most valuable members of the Staff we ever had, and the most devoted, untiring and thoughtful A.D.C.

April 19<sup>th</sup> 1916. Le Prieur, a French naval officer, a genius, has arrived. He brought with him an extraordinarily ingenious gun-sight, which we are going to adopt. I translated a German brochure on how to erect the Fokker, and wrote three long letters about bomb sights in French.

Head Quarters,

Royal Flying Corps. April 19<sup>th</sup>, 1916.

Mon Cher Colonel,

Le Capitaine le Prieur a eu la bonte de venir nous trouver a notre Quartier General pour nous montrer son viseur.

Nous en sommes enchanter et nous desirons vivement en procurer 300 .

Nous sera-t-il permis d'en faire une commande pour ce nombre ?

Nous ne comptons naturellement pas les recevoir tout de suite mais le plus tot possible.

J'ai envoye au Capitaine Innes Ker des renseignements precis sur le modele qui nous est necessaire, arm qu'il puisse faire la commande aussitot que vous nous en donnerez la permission.

## Notes on "Civil Aviation"

Nous voudrions en meme temps obtenir un ou deux des nouveaux Bi-plans Bleriot avec moteur Hispano. Pouvez vous nous accorder la permission d'en commander trois ?  
et pouvez vous nous livrer encore deux nouveaux moteurs Hispano, afin que nous puissions les monter vers le milieu du mois de Mai ?

Nous avons bien les trois quevous nous avez donnees, mais on est en train de les utiliser a des essais en Angleterre que nous ne voudrions pas entraver a moins que ce ne soit absolument necessaire.

Agreez, Mon Cher Colonel, l'assurance de mes sentiments bien devoues,

LE COLONEL REGNIER,

Directeur de Aeronautique Francaise.  
Boulevard St. Germain,  
Paris.

/

Head Quarters,  
Royal Flying Corps. April 19th, 1916.  
My Dear Colonel,

Captain Prieur had the goodness to come to us has our General District to show us his viewfinder.

We are enchanters and we wish to strongly procure 300.

We he be allowed to make an order for this number?

We do not naturally expect to receive them right away, but as soon as possible.

I sent Captain Innes Ker of accurate information about the model is that we needed, arm he can make the order as soon as you give us permission.

We would at the same time get one or two new Bi-planes Bleriot with Hispano engine. Can you give us permission to order three? and we can still deliver two new Hispano engines, so we can climb to the middle of May?

We have three quevous we have data, but it is being used in trials in England that we would not interfere unless it is absolutely necessary.

Accept, My Dear Colonel, l'assurance devotees of my good feelings,

COLONEL REGNIER,

Director Aeronautique Francaise.  
Boulevard St. Germain,  
Paris.

April 25th, 1916. We had a fine exhibition of flying at Candas. Sir Douglas came to see it. Also Morane and Saulnier from Paris. Morane flew to Candas from Paris, and made a terrifically fast landing in a Morane-Parasol. A lot of hair-raising flying was done, notably by Patrick.

April 26th, 1916. Patrick brought down an Albatross on our side of the line from 14,000 feet.

April 27th, 1916. The apple tree in the yard is green, but the elms are still bare. Read The Sinews of War, also La jfeune Fille Violaine and UEchange, by Claudel. The French have driven the Germans out of the air at Verdun.

April 28th, 1916. The road at the St. Andre Aerodrome is still not yet tarred. There is too much denting in the Morane cowl. The archies must be warned that

## Notes on "Civil Aviation"

the Morane bullet is going to be flown home. It is indistinguishable from the Fokker in the air.

April 30th, 1916. In No. 12 Squadron the cowls on the R.A.F. engines break at the tip.  
May 1st, 1916. The wind-screen on the Morane bullet is not satisfactory.  
May 2nd. 1916. Expedition to the Fourth Army.  
We took luncheon with us. Experiments were meant

to come off in the afternoon with aeroplanes and flares on the ground, but the rain prevented them. La Ferriere has got the Military Cross. The unsatisfactory windscreen in the Morane bullet must be mentioned to Morane when we go to Paris.  
On the 6th we started for Paris; we went via Pont de l'Arche, which is just outside Rouen. Nothing can describe the beauty of the drive through Normandy. At Pont de l'Arche we had a large engine repair shop which was one of the most efficient, well-organised, smoothly running and hard-working establishments of the whole war. We arrived there at 11, and spent the rest of the morning going over it.

On the 7th we went to London. It was arranged when I was in London before that I should be attached to the Russian Parliamentary Mission when it should come over to London on a visit. The mission had now arrived, and was being entertained in London. Among the Russian representatives was the notorious Protopopoff, who did a good deal of mischief later, and was largely instrumental in bringing the revolution to a head. I met him several times, and on one occasion I asked him if the ban on vodka would continue in Russia after the war.

"God forbid," he said.

"We

have suffered enough from it already." One night a large banquet was given to the Russians at Lancaster House. Lord Kitchener was there. It was just before his departure on his last fatal journey. I got back to France with the General on the 14th of May.

May 16th, 1916. I dined at the Hotel de France, Montreuil with Raymond Asquith. It was a lovely evening.

The next day we made a strenuous visit to the First Aircraft Depot at St. Omer, and to a number of Squadrons. We had now two large stationary Depots where stores were kept and aeroplanes repaired. One, which fed the northern Armies, was at St. Omer; the other, which fed the Southern Armies, was at Candas, on the way to Amiens. Besides these, each Army had an Aircraft Park, which was a mobile unit and was capable of moving at two hours' notice and dealing out supplies on the way to wherever it was going. All its stores were kept in portable, moveable boxes, which could be packed and put on lorries or a train at a moment's notice.

To give a kind of idea of the work we did during a full day's inspection, I will transcribe the account of our expedition on May 17th in full. May 17th, 1916 (St. Andre). We started for St. Omer at 9 for the First Aircraft Depot. We arrived about an hour later. One Bristol is now ready, and will be sent with overhead top gun-mounting to No. 11 Squadron.

## Notes on "Civil Aviation"

This news was wired from the First A.D. Another wire was sent asking whether they can send us from home one of the Sopwith interrupters. The Nieuport seat is to be altered for an eccentric one. The wireless transmitter is to go at the back of the observer's seat if the lip can be cut away. There were many other notes made at the Depot, and still more at the Squadrons. No. 29 Squadron. The Squadron had been mixing French and English gear in the Monosoupape engine.

Not having all English gear they put in all French gear. This practice is to cease. But how and why did they get French gear? That is the question. The Squadron didn't know whether the parts were English or French. No French spares are to be used unless they have no English ones, and then the G.O.C. is to be informed. All French gear is to be returned. Sparking plugs are giving trouble.

The First A.D. was wired to for English cam-gear. French spares, which had not been indented for, had been sent. Satellite-wheels which were really English were sent out as French. Bronze obdurator rings were wanted instead of brass ones. An endurance test for the tankage of the De Hav. is to be done at once.

At No. 6 Squadron the Le Rhone engine, No. 5311, was not working well. R.A.F. wires were reported almost invariably bent when new. At No. 1 the question of putting fabric over the hinges of the planes (as in the Morane biplane) was discussed. They have only one Le Prieur sight. What has happened to the 19 others?

No. 7 Squadron were one machine short. Other points that cropped up were the throttling of the no Le Rhone; Lorry 12,508, which arrived at n a.m., without a shelter. The lack of aerial winches in 13 and 12; parachute flares that failed to go off; split pins that were not supplied when asked for; and the lamentable case of a Bristol that was sent to No. 13 Squadron and put every bullet into its propeller with the Vickers gun, it not having been fired at the Depot, and another sad case of a machine which was received from the Depot yesterday, rigged completely wrong, and in which the engine vibrated badly; but this is not nearly all.

May 15th, 1916 - The blue on the rings of the Morane have been painted too light.

May 19th, 1916. To-day's great thought: Two acetylene welders are wanted for the Motor-transport.

May 20th, 1916. The parachute flares have again failed to give satisfaction in No. 10 Squadron.

May 23rd, 1916. I have been made a Staff Officer.

May 24th, 1916. There are only four full tubes of hydrogen in the balloon store. The terminal of the electric accumulator is being painted.

June 1st, 1916. The First Aircraft Park report a shortage of potassium metabisulphite.

June 2nd, 1916. When we got to G.H.Q. we heard the news of the battle of Jutland. I had not noticed it in the official German wireless which I translate every day. When I got home I found it described at length in the Nauen Press, which used generally to be full of nonsense. Cowls are coming out painted like canaries, and the grass on the Fienvillers Aerodrome is to be cut.

On June 3rd, 1916, the General and I went to London. We stayed there till the 9th. The day after we came back experiments were carried out in dropping phosphorous bombs on a balloon. Nobody hit a balloon.

June 4th, 1916. Wrote the following poem while waiting for the General in Intelligence G.H.Q.: Zeppelin, Zeppelin, burning bright Over Dover in the night; Sometimes over Folkestone too, What is there 'twixt me and you? Zeppelin, Zeppelin, how I wish You were but a silver fish; Swimming like a submarine, Underneath the ocean green. Zeppelin, Zeppelin, your delight Is in dropping bombs at night; How I wish that you and I Were dropping bombs on Germany!

June 15th, 1916. Several 5000 round-Webb-ammunition-belts are wanted at once, 1 E.E. 2D arrived.

The Rolls-Royce radiator is too large and can't keep the engine warm enough. The Rolls-Royce expert who is here says the service tank can't feed the carburettor properly.

June 16th, 1916. I heard the following conversation to-day between a pilot who was waiting in the ante-room and a young sailor who is going to pilot a

## Notes on "Civil Aviation"

Blimp, and who looks like a cherub :

The Pilot :

" You are going up in a gas-bag ?

"

The Sailor :

"

Yes."

The Pilot :

" You will go a pop when they hit you.

I should like to be there."

June, iSth, 1916. Anniversary of the Battle of Waterloo (Sunday). Went to High Mass at Montreuil. The priest in his sermon said :

" On a dit qu'on peut etre

bon patriote sans etre catholique ; on ne peut pas etre

bon catholique sans etre patriote."

Reading La Fontaine's Fables.

"

Flore aux regards rians, aux charmantes manieres."

The rubber rings on the induction pipe cylinder head in the new R.A.F. engine are too hard.

June iqth, 1916. My new flannel shirt, which is made of good flannel, not shrinkable an sich, and which has never shrunk before after being washed several times, has to-day come back from the wash all lumpy with tiny sleeves. Will it ever recover ? A medium nose-piece is necessary for all Clerget engines.

June 20th, 1916. Colonel Barres, commanding the French aviation, and Commandant Pugo, General Barres' Staff Officer, came to luncheon. We had a conference with the General on future operations, La Ferriere and I interpreting. No. 27 are short of batmen.

"

Il ne regnera plus sur l'herbe des prairies." (La Fontaine.)

June 22nd, 1916. A lovely and really hot day. We went for a long tour. The birds sang and the poppies flared in the wine-coloured clover, and tethered cows made a sleepy noise munching. Clips are wanted for the clock-mounting on the F.E.aB. Longcroft was shot at while he was in a kite balloon by a Lewis gun, and I suppose someone must have let off the gun.

June 23rd, 1916. Visited some Squadrons with Sir Walter Lawrence, who is staying with us.

" Le long d'un clair ruisseau buvoit une colombe,  
Quand sur Peau se penchant une fourmis y tombe ;

"

(La Fontaine.)

Everything is ready for the new push

June 2\$th, 1916. We went to Fienvillers, which is going to be our advanced H.Q. There we met Pugo and La Ferriere. A simultaneous attack was made on

## Notes on "Civil Aviation"

all the German kite balloons by the French and English.

This was the General's idea, and it was settled when

Pugo and Barres came the other day. The General bet

Pugo a franc we would bring down more than the French. We heard news of the bag at 4.30. ; 15 Kite

balloons were attacked and six were brought down.

June 26th, 1916 (St. Andre.) News of three more

kite balloons brought down yesterday. The Third

Army have received a telephone message saying that

the wire-cutting is going on satisfactorily on the

Gommecourt salient.

On the 27th of June we had moved to a little

village called Fienvillers. This was our advanced

Headquarters. The main bulk of our

H.Q. remained behind at St. Andre. Fienvillers is a

small village not far from Candas on the road to Amiens.

Our Headquarters were in a little square house which

stood at the meeting of five cross roads, with three rooms

and a kitchen downstairs and six bedrooms upstairs,

four of which were turned into offices. The advance

Staff consisted of Game, Gordon, Corballis, myself,

Pelham, and the wireless officer, Major Smith. I was

billeted in the village in a Notaire's house just opposite

our Headquarters. Beyond the village was the Second

Aircraft Depot and Aeroplane Repair Section, which

had now assumed gigantic proportions. There was

also another Aerodrome, on which two Squadrons

were stationed, Nos. 27 and 21. These formed the H.Q. Wing, commanded at this time by Major Dowding.

G.H.Q. was in a village called Beauquesne, about half

an hour's drive in a car. Sir Douglas Haig lived in a

chateau just outside that village.

On the evening of the 20th the R.E's. started on a

long bombing raid. And the next morning at dawn the raid was repeated. I heard the machines starting at

four in the morning, and went up to look at them. The

assault took place early that morning, and all the morning

telegrams came pouring in. The General sent me

to Vert Galant to see No. 60 Squadron ; to wait there

and bring back their news in the evening. No. 60 was

commanded by Ferdy Walrond, one of the pilots who came out in 1914, and were flying Morane bullets.

The Morane bullet was a beautiful machine to fly, a

monoplane, and very fast. It was the machine of which

the German Fokker was an exact copy. And the General

had ordered a Squadron of these machines against his

better judgment because the pilots had implored him

to. He proved right and they proved wrong, because

although the machine was a beautifully fast flying instrument,

it suffered from the defect of all monoplanes: you could not see out of it except by banking, and a

pilot cannot be banking the whole time. This machine

proved to be the most expensive in pilots and cost us

more in casualties than any other during the whole

war. And the Squadron which had these machines was

the only Squadron which had to be taken out of the

line for a prolonged period.

I spent all that first afternoon at Vert Galant. I had

luncheon with one of the Flights, and after luncheon,

## Notes on "Civil Aviation"

with Walrond and Smith-Barry, I saw the pilots start and then one waited and waited. . . . Who would come back ? Who would not come back ? At 4.30 Ferdy Walrond came back with his machine riddled with bullets. I went home at 4.30 and reported to the General, and then went back again at six, and stayed till 6.30. This time I saw a lot of pilots hot from the fighting and in a high state of exhilaration as they had had a grand day. Here are some of the stories transcribed as they told them me in their own words :

July 1st, 1916 :

Scott, in No. 5, said :

"

I saw a train about four miles from Cambrai on the Cambrai-Douai line, going towards Douai. I opened from 7,000 feet at it. When it saw me coming it pulled up and started going backwards to Cambrai ; when I was at 1,000 feet I released my bombs. The train pulled up. Suddenly one of my bombs fell 30 yards in front of rearcoach, destroying the line, and preventing the train going back to Cambrai. Another bomb fell on the embankment. When about 300 feet from the train I came under heavy machine-gun fire. Flying wires, longeron, petrol-tank were shot, and several holes in the machine."

July 1st, 1916 : Gordon-Kidd, in No. 7, dived on a train. He saw it at 3,000 feet, side-slipped so as to save time, to 2,800 feet, and then came down to 700 feet and dropped his two bombs. One hit the cutting ; the second one got the train plumb, and, as it was full of ammunition, it went off with a pop. All the other machines saw the train ablaze. Another bomb was dropped on the tail of the train.

July 1st, 1916 Smith saw 9 L.V.Gs. going in formation to Bapaume.

A lot of trains were seen between Cambrai and Bapaume.

It was a great strain waiting for Smith-Barry to come back ; but he turned up all right, late.

The excitement about the fighting in the air during these first days of the battle was intense. St. Quentin Station had been bombed by four machines, all of which failed to return. The pilots, however, came down safely. But the damage they did was beyond all hopes, as they happened to hit an ammunition train in the station and a Brigade was entraining at the moment. All these men were scattered to the four winds. An indescribable panic ensued. It took the Germans hours to collect the scattered remnants, and then they could no longer be sent to the front. We knew nothing of this at the time, but heard it much later, first from German prisoners, then from refugees, and lastly, from the pilots themselves who did the deed, and who were prisoners.

Gordon-Kidd, on the 3rd, dived on a train which was

leaving the station half a mile S.W. of Abancourt, and proceeding to Cambrai from Douai. Both bombs were released together at 700 feet, and both exploded. They fell short of the track. The second bomb was released by accident simultaneously with the first. It would undoubtedly have hit the train. Recrossed the line under heavy machine-gun and anti-aircraft fire.

All the fighting during these days and throughout the whole battle of the Somme took place far beyond the German lines, and a German machine scarcely could put its nose this side of the line. Here is an extract from the Diary of a German infantry soldier written about this date (or probably a little later) :

"

Everyday one can scarcely show oneself in the trenches owing to the English airmen. It is a wonder that they don't come and pull one out of the trenches so low do they fly. Not one of our German air heroes is to be seen. And yet we are told of the brilliant proportion 81 : 29. The fact of the Englishman being a thousand times bolder was not mentioned."

The man was being, without knowing it, extremely unfair to his Flying Corps, because if his German air heroes were doing their duty, they ought not to be seen by their infantry ; they ought to be seen by us. And although not now, but not much later, this was the kind of thing our infantry in all sincerity would say about our Flying Corps, sometimes at the very time when their work was being most arduous and most successful. On the 3rd of July I went to Vert Galant again, and again I saw Ferdy Walrond go up. But this time he did not come back.

Smith-Barry took over his Squadron. Every morning I used to go into Beauquesne with the General. During the first days of the battle we had an extra office in that village, which consisted of a room with a telephone and nothing else : not even a Bradshaw to read. But later on I used to wait at G.H.Q. in the Operations office, which was supplied with a plentiful library of detective stories and novels. The entries in my Diary of this period are scanty in the extreme. Here are a few :

July nth, 1916. The Germans in the trenches put up a notice the other day saying : "Tell your Fucking Flying Corps to leave us alone. We are Saxons." As it happened, they were Bavarians.

July i<sup>th</sup>, 1916. Yesterday I had the first whole holiday I have had since last August. How did I employ it ? I employed it thus : In the morning I went to No. 27 Squadron and spent the time in gossip. I must mention that the weather made all serious flying impossible. Then I went home. But on the way I met on the road Smith-Barry, who commands No. 60 Squadron. we had luncheon with Jimmy Tower. What did we have for luncheon? We had tongue for luncheon, and potatoes, and salad,

and a salad made of fruit. Then Smith-Barry said :  
" As it's a dud day and flying is out of the question,  
let us go and visit a French Squadron." we had luncheon  
with Jimmy Tower. What did we have for luncheon?  
We had tongue for luncheon, and potatoes, and salad,  
and a salad made of fruit. Then Smith-Barry said :  
" As it's a dud day and flying is out of the question,  
let us go and visit a French Squadron." Then Smith-Barry  
put on his field-boots and his flying jacket. Then he  
ordered the Morane biplane. Then it began to rain.  
Then we walked to the Aerodrome. As it was raining  
the machine was put back in her shed. And we waited  
and looked at the map, and Jimmy Tower showed us  
on the map where the nearest French Aerodrome was.  
Then the rain stopped, but it was still cloudy, grey  
and gloomy. Then I put on a leather coat and flying  
cap and climbed into the Morane biplane. Then the  
engine was started, and at once began missing because  
there was too much oil somewhere. Then Smith-Barry  
turned round and said to me: "  
I am afraid we must riddled, and presently the engine began to buzz and off we went. We had not flown very far, and  
were scarcely off the ground, before the machine tilted  
sharply left wing down. But of that more later. Then  
we zoomed up with a terrific yank and jerk. After a  
few bumps we got into a more or less calm area, and  
we flew right on till we got immersed in a great white,  
wreathy woollen cloud, and we dived out of it. Presently  
we saw the river (the Somme). Not long after we saw  
sheds beautifully camouflages, but beautifully visible  
also, and we dived down and landed (fairly well). A  
lot of Frenchmen swarmed round us. We got out. It  
began to rain again, and the machine was put in a shed. During tea, Smith-Barry  
told us that at the start, in getting off the ground, we  
had as nearly as possible crashed, because his left wing  
was an inch off the ground. He had never flown a Moranebiplane  
before, and he was not used, he said, to its  
lateral control, or rather, to its want of lateral control  
(he said it had none, otherwise it was a charming  
machine) ; nor to the effect of a passenger being in it.  
As soon as it stopped raining we flew home. And for a  
little time we that is Smith-Barry lost the way (no  
maps), and we suddenly found ourselves over the trenches. We made a demi-tour and soon returned safe  
to our landing-ground, on which we steeply swooped.  
The people who met us Sommers ^ Portal, etc. said  
that our start had been the most terrifying thing they  
had ever witnessed. The weight of one pencil on the  
plane and we should have crashed, which shows how  
lucky it is not to know and not to understand too  
much ; as I had noticed nothing, or rather, / had  
noticed but thought that was the star way to fly. What  
would have happened if that machine had crashed, or  
if anything had happened to Smith-Barry, who is a  
star pilot ?

July iSth, 1916. Du Peuty came to see us. The  
R.E. 8. is at the A.D. It's camera needs a larger case.

## Notes on "Civil Aviation"

The machine is to be kept a fortnight so that the gun mounting and camera can be altered to what we want.

July 21st, 1916. The General sent the following telegram to No. 24 Squadron :

" Well done, 24

Squadron, in fight last night. Keep it going ; we have the Hun cold." Cooper, in 21 Squadron, was killed by a direct hit from an archie.

July 22<sup>nd</sup> 1916. Lord Northcliffe came to luncheon.

July 23<sup>rd</sup> 1916. I went with the General and Toe Smith to Fricourt, where the fighting has been, to see the ground wireless stations and mechanics.

July 24<sup>th</sup> 1916. From a letter : "I have been all day on the battlefield through the German trenches, which we took the other day. It is like a moonscape sprinkled with poppies and dead Germans' great coats, and here and there a gas mask. Shells were bursting in the distance, and our guns were firing, and there was a scream of whistling metal in the air everywhere. Troops swarming, aeroplanes flying about ; the sky quite grey, so that one wondered if one were awake or not. I think on the whole not. The village of Fricourt is entirely destroyed, and that of Mametz is annihilated, and there is nothing left of it but crumbling stones.

July 25<sup>th</sup>, 1916. From a letter :

" The sight of

the battlefield is amazing. It is one of destruction on a larger and more systematic scale than has ever occurred before. It is difficult to see in the villages where the houses were. The ground looks as though it had had streams of lava pouring over it for days out of a red-hot volcano. It is pitted with countless craters ; some of them are bright yellow, with picric acid. And the noise goes on without stopping. In the further distance you see a column of shell smoke stationary in the air like a permanent geyser, only black. Was ever a battle like this fought in the world before ? The answer is in the negative."

July 26<sup>th</sup>, 1916. Sopwith No. 5721 is to be struck off strength and made into spares. The Second Brigade are not using the pannel for signalling with the gunners.

July 30<sup>th</sup>, 1916. As we were coming back from the Chief's house, the steering-gear of the car broke and we alighted in the ditch. Later in the morning the General made a speech to the Air Mechanics in the Depot, who have been working like slaves ever since the battle began. They were all paraded in front of the shed, hundreds of them, and they marched and wheeled and formed different things so well that the General, when he began his speech, told them he thought they were the Guards. That pleased them. Then he told them how well he knew how "

## Notes on "Civil Aviation"

fed up  
"

they must be with the work they were doing at such high pressure, how disheartening it must be sometimes owing to the way aviation had of letting you down. But they were keeping the Squadrons up to strength and beating the Germans. They enjoyed the speech immensely, and I nearly cried.

August 1st, 1916. The General sent me to the 2 A.D. to find out answers to the following conundrums. I saw Meade, who is in charge of Aircraft Repair Section :

How did the test of the  
1 60 do yesterday ? All right. How many hours has it done now ? It had to come down yesterday because of the air pump ball-race. It did about 21 hours yesterday. Probably 1 8 altogether and 2 this morning.

Strengthening the carri- Machine ran into a hangar, age of the no Morane- Will send in report. Scout. Just above the wheels - Machine ran into a hangar Will send in report. Gun ought to have swan- necked feed so as not to flap about. - Noted.

How is the Sopwith getting on ? Still a lot of work to be done.

When will there be any Nieuport Scouts ready for use, and how many? - 2 can be ready for issue, i certainly. 2 by mid-day to-morrow.

re: Morane-Parasol. Have they taken off the Alcan device? Yes. This will also need a swan-neck feed. Noted.

August 6th, 1916. No. 70 Squadron arrived at Fienvillers. They have Sopwith two-seaters, commonly called "one and a half strutters."  
August 7th, 1916. The Martinsydes want cellon for their lower planes.

August 10th, 1916. Visited the Fourth Aircraft

## Notes on "Civil Aviation"

Park with the General, and found some scandals, notably that the bootmakers were mending and making boots. This, although it sounds reasonable, is really a waste of labour, as the boots can and should be sent in to the place where boots are mended by the score, and the bootmakers can do something more useful in an aircraft park.

August 15th y 1916. A happy day at the Depot and Repair Section. The Parasol gun-mounting : had they got it higher, had it been flown ? The answer was the rear gun-mounting was completed late yesterday. The no Le Rhone was flown by Busby, and was found to be very fast : to run along after landing and to want space. Another big attack has come off. It is going well. August 20th, 1916. A new R.E. 7. arrived : a huge machine with a 200 Rolls-Royce engine carrying a crew of three.

August 23rd, 1916. We went to the Depot at St. Omer. There was found to be no swivel gun-mounting on the F.E. and none in reserve.

August 24th, 1916. Colonel Barres came to luncheon and Commandant Pugo. Pugo gave the General a beautiful silver franc for losing his bet about the kite balloons. They have renewed the bet for next time.

August 26th, 1916. Had my eye-glass mended by a skilled mechanic.

August 30th, 1916. Received news that Mr. Cornish, the Vice-Provost of Eton, had died. This will sadden those in the Army who were his old pupils. I was not his pupil, but I owe him more than any pupil ever owed to any master. He pulled some of the weeds, or did his best to, out of my mind and taught me the things which were worth knowing and liking.

During the first days of September we had several visitors, among others, Lord Derby, Mr. Asquith, and Mr. H. G. Wells. I took Mr. Wells to see the Aircraft Repair Section, but I had too little time to show him all that was really of interest.

On the 8th we had a Conference of Brigadiers, at which questions dealing with future operations were discussed.

On the 12th a Kite Balloon Conference took place, attended by all the Kite Balloon Commanders. I made detailed notes of what happened at this Conference. They are worth quoting as an instance of the kind of things that have to be dealt with in modern war, the

## Notes on "Civil Aviation"

kind of way work is done and the extraordinary number of small details that have to be attended to.

September 12th, 1916. The Kite Balloon Conference, at the Third Brigade, was attended by the Kite Balloon Commanders : Cleaver, Boyle, Byng, MacNeece, and Wyse. Following is a brief summary of the Conference :

### OBJECT OF THE CONFERENCE.

To get into closer touch with the Kite Balloon Squadron Commanders .

To point out that as the War continues, and the scale of work increases, individualism, which has been a good thing and unavoidable in the past, will have to give way to uniformity. This does not mean that progress will cease, but that progress will work towards one uniform standard.

### POINTS DISCUSSED.

#### Rigging.

Boyle thought guides ought to be made of cotton rope instead of hemp rope, because cotton ropes are easier to handle. He preferred the Caco Balloon to the old one. It can go up in a stronger wind, and is steadier.

Byng also preferred the Caco Balloon. He said it is steadier, and can work in a rougher wind, even in a 16-mile gusty wind. He considered the guides were not long enough and would like them thicker, not merely for the sake of comfort, but for safety. (Boyle here gave us to understand that this is what he had meant to say.) He did not care if they were changed to cotton. He said the Caco Balloon had done 4,800 feet with two passengers and ballast. Cleaver had had no experience as yet of the Caco Balloon, (which should be spelt Caquot.) But he thought it was better, more stable and had a better lift. He was in favour of adopting the Caquot. He had nothing to say about the rigging.

With regard to the handling ropes, he thought they could be shortened and a long cotton rope added to them. The G.O.C. suggested the pushed Bell handle rope. Squadron Commanders deprecated this as being likely to suffer from wet. Cleaver did not like the curve on the basket. He thought the lead on the metallic V might be shortened.

MacNeece thought the handling ropes should be softer and thicker. He agreed about the basket with Cleaver. He liked the Caquot.

Wyse thought the basket suspension too short. This could be remedied by putting slots (?) ; he also approved of cotton ropes for handling guides. He wanted ropes to be in one piece.

Byng wants a hole cut in the back of the Balloon to let the air out quicker when on the ground.

Boyle raised the question of valve lines.

Cleaver used aeroplane cable on his suspension car, and preferred it as he said it doesn't chafe. This question does not arise in the Caquot balloon.

Byng wants a spare bar or hoop as the case may be.

#### Winches.

Cleaver was in favour of the Delahay winch. He didn't

## Notes on "Civil Aviation"

know its power, nor its power compared with the Scammell

He thought the Scammell was not sufficiently powerful to pull down the balloon he has got now. Being asked by the G.O.C. whether he ever pulled down his balloon at top speed he said :

"

No, never except on a fine day."

MacNeece did not know the power of the winches either.

He had hauled down at top speed.

Wyse had never had a Delahay winch. He knew nothing of their power.

Byng didn't think the Scammell powerful enough. He thought the Caquot needed a more powerful winch. Asked why, he said because it works in a stronger wind and at a greater height Byng and Boyle agreed in thinking one should be able to pull down the balloon at top speed or 8,000 feet a minute in a 30 -mile wind.

Cleaver thinks the Scammell winch too heavy and not mobile enough. He would like a Caterpillar. He didn't care how slow he moved. The Scammell, he said, needed a metal road. MacNeece thought a Caterpillar would not stand a long advance. He advocated chains. He said the Scammell was more mobile in a wind.

Wyse said if winches are too light they are towed by the balloon. He said the Scammell loses ground going round corners. He was strongly against a Caterpillar.

Byng would like a petrol electric winch for changing gear while hauling down. He thought the most mobile winch would be the horse-drawn one. He was against a Caterpillar.

Boyle was in favour of chains and against a Caterpillar:

Telephones.

Should they be in the hands of Squadrons or of Signals ?

Cleaver voted for signals.

Wyse for Signals.

Boyle for Squadrons.

Byng, who had had experience of both, was indifferent.

Parachutes.

Byng did not like the cap, which he said comes off too quickly.

Wyse said the rubber band perishes.

MacNeece thought the parachute ideal, if the packing was all right.

Cleaver thought the rubber rings were not good.

No definite allowance of spare rubber bands is laid down. This was noted by Currin and Brooke-Popham.

The majority thought the parachute should not be fastened to the Balloon and to the observer, but ready for the observer to fasten completely at the last moment.

## Notes on "Civil Aviation"

Boyle thought all fastening should be done, and that the only reason the observers were against this was because they were afraid of the parachute coming out, and being blown out themselves. He thought the rubber rings were not to be relied upon in all circumstances. Boyle raised the question of the supply of gas. He said he had to send 40 miles each way for it. He suggested an advanced Depot at Fricourt.

Byng raised the question of red arrows being no longer painted on the tubes. This gives a lot of extra labour.

Boyle says his establishment is too small for the amount of paper work he has to do. He has no clerks, only one corporal. He wants typewriters.

On the 14th September, 1916, the General made a speech to the mechanics in the morning, and after luncheon he spoke to all the officers of the Squadrons belonging to the Ninth Wing, who were assembled in a shed. He told them about what was going to happen next day, that a big offensive was going to be made, that tanks were going to be used for the first time, and a great effort was going to be made to strike a decisive blow. The effect of this speech is well described in "An Airman's Outings," by a pilot who was present, and who writes under the name of

"

Contact."

During the night machines were sent out with orders to drop bombs on the enemy's billets, railway junctions, aerodromes, and any other targets. This was done from every aerodrome in the Somme area. In the morning, before dawn, Ian Henderson left from No. 19 Squadron for special Contact patrol work to follow and report on the movements of the infantry. He landed two hours later, his machine riddled with bullets, and came straight to our Headquarters. His face was glowing with excitement, and black with oil. He had seen our troops leave the trenches and go ahead. Only a few, he said, were held up. Selous, the son of the famous big-game hunter, took Ian Henderson's place. In the afternoon Selous came back with news of the tanks, and Ian Henderson was sent out again. He was a long time coming back from this second expedition, and we began to grow uneasy, but he landed all right with several wires and struts shot, and even his engine hit. He had seen one of the tanks capture a village at the head of a column of men walking beside it, cheering and waving to him as he flew over.

September 16th, 1916. Minding, a pilot in 34, had his main spar shot by a shell. Two-thirds of the main spar were shot out and the whole length cut. He signalled:  
"Have been stung by a wasp."

## Notes on "Civil Aviation"

On September 14th, No. 34 never had less than six machines in the air : most of them did seven hours. Holt got bored with his registering, so went down to 1,300 feet and machine-gunned the battery. Artillery co-operation had never been so great in volume, nor so effective.

On the 15th we suffered one very sharp loss in the shape of Cruikshank, one of the most gallant pilots who ever flew. He was not only as brave as a lion but absolutely untiring. He had been fighting ever since the beginning of the war. And I think there was no one in the Flying Corps ever did so much work at a stretch. He had a sublime and, alas ! as it proved, a mistaken belief that nothing could touch him or hurt him.

On the 17th, while I was showing a party of Russians round the Aerodrome, someone casually told me that Raymond Asquith had been killed. What a waste people said, when they thought of his brilliant brain, his radiant wit, his mastery of language, his solid scholarship, and all his rare gifts. But it wasn't a waste, and never for one moment did I think so. Raymond's service at the front was the crown and purpose of his life. A purpose fulfilled to a noble close. He loved being in the Army as much as he had hated being at the Bar. He went on with his life in the Army where he had left it off at Oxford, and he died in a second miraculous spring ; and by being in the Army and being what he was, and doing what he did, in the way he did it, he made it a little easier for us to win the war.

On the 23rd of September, 1916 : The fighting in the air which formed part of the big attack on September 15th made the General more and more anxious about the future. It would be strange if such a situation could last. So a memorandum was written which embodied the General's views. This memorandum was afterwards printed and circulated, and parts of it embodied later in a pamphlet called Offence and Defence. As it contains the main principles of our policy in the air, I quote it here. It contains nothing technical :

Since the beginning of the recent operations the fighting in the air has taken place over the enemy's line, and visits of hostile aeroplanes over our lines have been rare. It is to be hoped that this state of things may continue, but as one can never be certain of anything in war, it is perhaps an opportune moment to consider what policy should be adopted were this state of affairs to change, and were the enemy to become more enterprising and more aggressive. It is sometimes argued that our aeroplanes should be able to prevent hostile aeroplanes from crossing the line, and this idea leads to a demand for defensive measures and a defensive policy. Now is the time to consider whether such a policy would be possible, desirable and successful.

## Notes on "Civil Aviation"

It is the deliberate opinion of all those most competent to judge that this is not the case, and that an aeroplane is an offensive and not a defensive weapon. Owing to the unlimited Space in the air, the difficulty one machine has in seeing another, the accidents of wind and cloud, it is impossible for aeroplanes, however skilful and vigilant their pilots, however powerful their engines, however mobile their machines, and however numerous their formations, to prevent hostile aircraft from crossing the line if they have the initiative and determination to do so.

The aeroplane is not a defence against the aeroplane.

But the opinion of those most competent to judge is that the aeroplane, as a weapon of attack, cannot be too highly estimated .

A signal instance of this fact is offered to us by the operations which took place in the air at Verdun.

When the operations at Verdun began, the French had few machines on the spot. A rapid concentration was made, and a vigorous offensive was adopted. The result was that superiority in the air was obtained immediately, and the machines detailed for artillery co-operation and photography were enabled to carry out their work unmolested, but as new units were put into the line which had less experience of working with aeroplanes, a demand arose in some quarters for machines of protection, and these demands were for a time complied with. The result was that the enemy took the offensive, and the French machines were unable to prevent the hostile raids which the enemy, no longer being attacked, was now able to make. The mistake was at once realised and promptly rectified. A policy of general offensive was once more resumed, and the enemy at once ceased to make hostile raids, all his time being taken up in fighting the machines which were attacking him. Superiority in the air was thus once more regained .

On the British front, during the operations which began with the battle of the Somme, we know that, although the enemy has concentrated the greater part of his available forces in the air on this front, the work actually accomplished by their aeroplanes stands, compared with the work done by us, in the proportion of about 4 to 100. From the accounts of prisoners, we gather that the enemy's aeroplanes have received orders not to cross the lines over the French or British front unless the day is cloudy and a surprise attack can be made, presumably in order to avoid unnecessary casualties. On the other hand, British aviation has been guided by a policy of relentless and incessant offensive. Our machines have continually attacked the enemy on his side of the line, bombed his aerodromes, besides carrying out attacks on places of importance far behind the lines. It would seem probable that this has had the effect so far on the enemy of compelling him to keep back or to detail portions of his forces in the air for defensive purposes. When Lille station was attacked from the air for the first time no hostile aeroplanes were encountered. The second time, this place was attacked our machines encountered a squadron of Fokkers, which were there for defensive purposes. This is only one instance among many.

The question which arises is this : Supposing the enemy, under the influence of some drastic reformer or some energetic leader, were now to change his policy and follow the example of the English and the French, and were to

cease using his aeroplanes as a weapon of defence and to start a vigorous offensive and attack as many places as far behind our lines as he could, what would be the sound policy to follow in such a case ? Should we abandon our offensive, bring back our Squadrons behind the line to defend places like Boulogne, St. Omer, Amiens and Abbeville, and protect our artillery and photographic machines with defensive escorts, or should we continue our offensive more vigorously than before ? Up to now the work done by the Germans compared with that done by our aeroplanes stands, as we have seen, in the proportion of 4 to 100, but let us suppose that the enemy initiated a partial offensive in the air, and that his work increased, compared with ours, to a proportion of 30 or 50 to 100, it is then quite certain that a demand for protective measures would arise for protective Squadrons and machines for defensive patrols. One of the causes of such demands is the moral effect produced by a hostile aeroplane, which is out of all proportion to the damage which it can inflict.

The mere presence of a hostile machine in the air inspires those on the ground with exaggerated forebodings with regard to what the machine is capable of doing. For instance, at one time on one part of the front whenever a hostile machine, or what was thought to be a hostile machine, was reported, whistles were blown and men hid in the trenches.

In such cases the machines were at far too great a height to observe the presence of men on the ground at all, and even if the presence of men was observed it would not lead to a catastrophe. Again, a machine which was reported in one place would certainly, since it was flying rapidly, be shortly afterwards observed in another part of the lines and reported again, but the result of these reports was often that for every time the machine was sighted a separate machine was reported, leading at the end of the day to a magnified and exaggerated total. The sound policy, then, which should guide all warfare in the air would seem to be this : to exploit this moral effect of the aeroplane on the enemy, but not to let him exploit it on ourselves. Now this can only be done by attacking and by continuing to attack.

It has been our experience in the past that at a time when the Germans were doing only half the work done by our machines that their mere presence over our lines produced an insistent and continuous demand for protective and defensive measures.

If the Germans were once more to increase the degree of their activity even up to what constitutes half the degree of our activity, it is certain that such demands would be made again.

On the other hand, it is equally certain that, were such measures to be adopted, they would prove ineffectual. As long as a battle is being fought, any machine at the front has five times the value that the same machine would have far behind the lines. If the enemy were aware of the presence of a defensive force in one particular spot he would leave that spot alone and attack another, and we should not have enough machines to protect all the places which could possibly be attacked behind our lines, and at the same time continue the indispensable

work on the front.

But supposing we had enough machines both for offensive and for defensive purposes. Supposing we had an unlimited number of machines for defensive purposes, it would still be impossible to prevent hostile machines from crossing the line if they were determined to do so, simply because the sky is too large to defend. We know from experience how difficult it is to prevent a hostile vessel, and still more a hostile submarine, from breaking a blockade, when the blockade extends over a large area. But in the air the difficulty of defence is still greater, because the area of possible escape is practically unlimited, and because the aeroplane is fighting in three dimensions. The sound policy would seem to be that if the enemy changes his tactics and pursues a more vigorous offensive, to increase our offensive, to go further afield, and to force the enemy to do what he would gladly have us do now. If, on the other hand, we were to adopt a purely defensive policy, or a partially offensive policy, we should be doing what the French have learnt by experience to be a failure, and what the rank and file of the enemy, by their own accounts, point to as being one of the main causes of their recent reverses.

Moreover, in adopting such a policy it appears probable that the Germans are guided by necessity rather than by choice, owing to the many fronts on which they now have to fight, and owing also to the quality and the quantity of machines they have to face on the Western Front alone. Nevertheless, one cannot repeat too often that in war nothing is certain, and that the Germans may, either owing to the pressure of public opinion, or the construction of new types of machines, or the rise of a new leader, change their policy at any moment for a more aggressive one.  
Hugh Trenchard September 22nd, 1916.

ON the 22nd September, 1916, on our way to G.H.Q., we were kept waiting a long time at the Candas level-crossing, by trains, and on our return journey we found a block, and a seething confusion caused by two batteries, a column of infantry, a line of R.F.C. transport, a number of lorries, light-tenders, and touring cars and motor cyclists, all going in opposite directions. They had been there three-quarters of an hour. The General got out and gave a few orders, and made some of them stop and others move, and halt and move again, and in five minutes' time the tangled skeins of traffic were disentangled and moving on once more. Further news of fighting came in the afternoon. We spent some hours at the Depot, where we were told that the hand starter epicyclic-gearing on the R.E.y, with the 250 Rolls-Royce engine, had gone wrong.

September 23<sup>rd</sup>, 1916. From my Diary : Three French officers came to the Depot in the afternoon. Talking of the different makes of the Hispano engines, they picked out one maker as being the only good one. It was the one our pilots say is the only bad one, and the engine they clamour for is the one the French said was the worst.

## Notes on "Civil Aviation"

September 28th, 1916. The shock-absorber on the tail-skid of the Morane is too fierce.

October 2nd, 1916. The Maxim gun on the Aerodrome has no washers.

October 2nd, 1916. Tour round the Kite Balloon Sections. No.1 Section :  
the gland for taking pressure in the balloon is unsatisfactory.

The rope on the Caquot is different from the rope they repair it with.

October 6th, 1916 : Bron Lucas arrived in France - was made a Flight Commander in No. 22 Squadron. He had already flown his new machine, an F.E. 2.B. He wanted three valve rockers (old type) for the 120hp Beardmore engine. We were able to provide him with these immediately, which surprised him, after being in England, where he said it was difficult to get a split pin out of anybody. Here in France, he said, you felt that everyone was out to help you. The next time I saw him was on October 11th. He had been over the line, and had been archied and a bit of his propeller had been shot off. His Squadron Commander said they could not keep him out of the air.

16 October 1916 : The front : Ridley, who had been a pilot in No. 60 Sqn, arrived back

Ridley, had landed in the German lines near Cambrai in August 1916 where he had remained concealed for some weeks. RFC HQ Officer Maurice Baring had spent the morning with him before he started on this expedition.

He had then walked to Belgium, where he was once actually arrested on a tram.

He hit the policeman in the face and jumped off the tram.

He had walked about in the guise of a man with an earache.

He couldn't speak French or German.

He had a passport with his photograph on it given him by the German authorities.

He gave me this photograph, which looks like the picture of an Englishman without a collar.

He walked five miles to the frontier wires carrying a ladder ; when he got there he climbed over into Holland. Trenchard gave him the D.S.O.

28 APRIL 1915 : Canada Gazette : ORDER IN COUNCIL : AT THE GOVERNMENT HOUSE AT OTTAWA : HIS ROYAL HIGHNESS THE GOVERNOR GENERAL IN COUNCIL.

WHEREAS by section 291 of The Customs Act it is provided that "the Governor in Council may, from time to time, prohibit the exportation or the

## Notes on “Civil Aviation”

"carryinQ coaatwise or by i nland navigation, of arms,

"ammuntti on and gunpnwder, military and naval

"etores, and any articles which thi Governor in

"Council deems capable of being converted into or

"made useful in increaeing the quantity of militnry or

"naval storee, provisions or auZ sort ot victual which

may be used as food by man” And whereas an Order in Council, dated the 8th

August, 1914, and various orders, dated respectively, the 7th August, 1914, the 29th October, 1914, the 27th

November, 1911, and the 23rd January, 1915, have been issued in pursuance of the aforesaid powers. And whereas it is expedient that the said orders should be consolidated with amendments and additions, and that such orders should be revoked ;

And whereas the articles, other than arms, ammunition, gunpowder, military and naval stores, hereinafter enumerated are articles which the Governor in Council deems capable of being converted into or made useful in increasing the quantity of military or naval stores, provisions or any sort of victual which may be used as food by man,-

Now therefore His Royal Highness the Governor General in Council in pleased to declare that the above

mentioned orders be and thwsaine are hereby revoked . And in virtue and in excrviso of t1 iv F NINY're aturu•

said, and under and in virtue Of section tl of The lVar Moseana Act, 1914, Ilir ItoYal Highuesn the quvurnor

tivneral in Council is 1draw-4 furthur to duolaru and it

is hereby declared as follows: • (A) That the exportation of the following glMMIE b,} to hit dte al to all dtlationv other than the Itoited Kingdotn, British l' wwwtions and l'rotcrtotaloe, F' rmtco, Ruseia (excIpt Bnlitic ptrta), Ja) I nn, United States

when for consumption in United States only, not distributed to a representative of consumers in United Kingdom via

Cte~ 8tarus, or exp rrud via United States under license or dispensation from Canada, via.

(A) That the exportation of the following goods be prohibited to all destinations abroad *other than the United Kingdom, British Possessions and Protectorates:*

Aeroplanes, airships, balloons and aircraft, of all kinds and their component parts, together with accessories and articles recognizable as intended for use in connection with aeroplanes, airships, balloons and aircraft, including:

gold beater's skin, shantung silk in the piece ;

## Flax fabric suitable for aeroplanes ;

non-inflammable “celluloid” sheet (or similar transparent material non-soluble in lubricating oil, petrol or water) aeroplane dope ;

high tensile steel tubes ;

aeroplane instruments (aneroids, barographes, revolution indicators)

aeroplane turnbuckles ;

steel stampings ;

magnetos

; aeroplane engines and parts ;

amyl acetate ; aceto-cellulose ; trephenyl phosphate ;

Summer of 1915 : Co-operative aircraft construction centres similar to Scotland had been set up in Coventry, Manchester and London.

23 April 1915 : United States : ACA met for the first time in the office of the secretary of war. Add the word "National" to their designation. filling out the acronym NACA by which it was thereafter known and distinguishing itself from the British Advisory Committee for Aeronautics after which it was modeled and named. (source : Minutes of Meeting of National Advisory Committee or Aeronautics held in the War Department at Washington, D.C., April 23, 1915"; Scriven to The Advisory Committee for Aeronautics, 16 Apr. 1915.) At the Committee's direction, the secretary conducted a survey of aeronautical activity in the United States, confirming what was already suspected: there was precious little activity, and it was in a sorry state compared to the progress being made in Europe

1915 : A paper to the engineer who may be working on new aeroplanes, or to the manufacturer of accessories, was some time ago presented to the Laboratory Committee of the Aeronautical Society, in England, by J. Brimelow and W. G. Mann. Twelve tests were made with turnbuckles regularly on the market, each specimen being pulled to destruction. -Aeronautics

## Notes on "Civil Aviation"

June 1915 : The Ministry of Munitions Act laid before Parliament.

1915 : United Kingdom - War Office - Department of Military Aeronautics moves from the War Office building to 13 Albemarle Street. A.I.D headquarters moves to the new Department of Military Aeronautics offices.

Department of Military Aeronautics / A.I.D Organisation:

Col. Fulton - Deputy Director of Military Aeronautics (he died 4 days later)

Maj Beatty - (left AID to replace Col. Fulton)

Capt Bagnall-Wild - Chief Inspector (formerly inspector of engines)

Capt R. H. Verney, RFC - Inspector of Engines.

At this time the A.I.D technical strength had risen to 488. A.I.D Headquarters dealt with:

1. work which was not inspectional.
2. Technical questions raised by the RFC
3. Technical questions raised by contractors
4. difficulties met by contractors lacking experience in the care and procedures for heat treatment demanded by the new special alloy steels in the production of that material as well as parts and pieces made from it. A.I.D dispatched "release notes" for the "material leaflets" containing technical information and detailing the recommended heat treatments. (the fore-runner to the "Notices to Ground Engineers")

The A.I.D was the chief technical adviser to the "Department of Military Aeronautics" concerning:

1. modifications to aircraft which had reached the production stage.
2. modifications to engines which had reached the production stage.

Royal Aircraft Factory - Farnborough was the chief technical adviser to the Department of Military Aeronautics concerning

1. modifications to experimental aircraft.
2. modifications to experimental engines.

Technical questions relating to aeroplanes and engines designed and manufactured by the Royal Aircraft Factory were answered by Farnborough.

Decentralization of the AID's activities began in 1915, with inspection handled through district organizations.

To prevent wastage of material and unnecessary transport of sub-standard goods to main contractors' works, inspection began at the works of sub-contractors supplying materials and components.

Staff shortage was such that AID begins recruiting and training women as "viewers" (pioneering the entry of women into industrial inspection).

From 1916 to the war's end not less than half the AID's staff were women.

A.I.D requirements for interchangeability of parts and pieces was essential and worth every effort to develop the standards.

By WW1?, as a check (and proof) of its success in achieving it the A.I.D dismantled a number of completed and tested engines built in both the parent and "shadow" factories and then thoroughly mixed the parts.

Complete engines were then built from these mixed parts and tested with satisfactory results.

To achieve similar interchangeability with large and complex airframe components, carefully conceived systems of assembly jigs, jig references and acceptance gauges, using such techniques as optical alignment, were developed.

August 6, 1915 : After a non-stop day and night production for 12 months to meet war demands, the Raf closes for three days' rest.

In 1915 The London County Council agreed to place its resources at the disposal of the Ministry of munitions to manufacture munitions and train workers for munition factories.

The lines of training developed for Munitions workers included:

- a) general machine-shop practice,
- b) turning,
- c) milling,
- d) grinding,
- e) screw gauge lapping and measuring,

## Notes on "Civil Aviation"

- f) fitting,
- g) assembling,
- h) gauge making,
- i) instrument making,
- j) lead burning,
- k) copper-smiths work,
- l) woodwork machining,
- m) woodwork assembling for aeroplanes,
- n) propeller-shaping,
- o) compass painting, and
- p) tracing for drawing offices.

8. Northolt :
1. two BE2C's manned by specially trained pilots,
  2. six mechanics
  3. RE party operating a searchlight
  4. Anti-aircraft guns
9. Wimbledon Common :
1. two BE2C's manned by specially trained pilots,
  2. six mechanics
  3. RE party operating a searchlight
  4. Anti-aircraft guns

Spring of 1916 : British MP Noel Pemberton Billing calls for a judicial enquiry into the military and naval air service, as "certain officers (Lieutenant Desmond Lucius Studdert P. P. Arthur ) had been murdered (rather than killed) by:

- I. the carelessness, incompetence or ignorance of the senior officers of the military and naval air service; or by
- II. the carelessness, incompetence or ignorance of the technical side of the military and naval air services".

3 August 1916 : An "official investigation" by a government committee set up on XXX concludes that Lieutenant Desmond Lucius Studdert P. P. Arthur was at fault, and the crash a result of dangerous flying.

end of 1916 : Additional Government committee finding : Lieutenant Arthur's aero-plane crash due to wing damage.

January 1915 the South African pilots were appointed in the Permanent Force and recalled to the Union to help man the SAAC established on 29 January 1915 for service in German South West Africa.

By May 1915 six Henri Farman F-27 and two B.E.2C aircraft were able to take to the air in support of General Botha's forces.

## Notes on "Civil Aviation"

Within a very short space of time the SAAC pilots had proven their worth, flying regular reconnaissance patrols to keep Gen Botha constantly informed of the enemy's movements and positions.

The Farmans also carried out a number of bombing missions. After the German South West Africa campaign, the majority of the SAAC pilots volunteered for further service in England, where they were to form the nucleus of 26 (South African) Squadron (Sqdn) of the RFC. This unit was dispatched to East Africa in December 1915 to carry out reconnaissance, bombing and communication missions in support of Gen Smuts' forces. The squadron was eventually recalled to England and disbanded in 1918. Early in 1920 the British Air Ministry declared the "Cape to Cairo" air route, which provided for 24 aerodrome and 19 emergency landing strips, fit for use.

The London Times announce that it would finance the first flight to the Cape and its aircraft - a Vickers Vimy Commercial, G-EAAV- took to the air on 24 January 1920.

General J.C. Smuts however wanted South African aviators to be the first to complete the trip. He therefore authorised the purchase of a Vickers Vimy at a cost of 4 500 pounds. Christened the Silver Queen, and commanded by Lt Col H.A. (Pierre) van Ryneveld with Fit Lt Quinton Brand as co-pilot, the aircraft took off from Brooklands (England) on February 1920. After an eventful night crossing of the Mediterranean, they arrived at Derna the following morning. Further night flying following in an attempt to catch the Vickers Vimy sponsored by the London Times, but the Silver Queen was wrecked in a force landing at Korosko, Sudan.

Another Vimy F8615 was purchased from the RAF at Heliopolis into which the original engines were installed. The Silver Queen II (as the second aircraft was named) left Cairo on 22 February. Five days later the Times contender was destroyed in a crash at Tabora, but on 6 March the same fate befell the Silver Queen II at Bulawayo.

Fortunately, with some of the Imperial Gift aircraft already in Pretoria, a DH9 H5646 called Voortrekker was assembled and flown to Bulawayo. Thus Van Ryneveld and Brand were able to complete their flight to the Cape where they arrived on 20 March 1920 after a total flying time of 109 hours and 30 minutes. 1920 saw the establishment of the South African Air Force (SAAF).

Col Pierre van Ryneveld was appointed Director Air Services (DAS) with effect from 1 February 1920 with instructions to establish an air force for the Union. This date is acknowledged as marking the official birth of the SAAF.

The establishment of the SAAF was greatly facilitated by the extremely generous decision by the Imperial Government in 1919 to allocate to the Union some 100 aeroplanes from its war stocks, complete with spares and equipment.

These were joined by a further 13 aircraft from other sources making a total of 113 aircraft. Eleven DH. 9 aircraft and Experimental Air Mail Service between Cape Town and Durban in 1925. Although the SAAF rendered an efficient service, it was a commercial failure. In September 1931 the Department of Civil Aviation was transferred to the Department of Defence and the post of Director of Civil Aviation abolished. The entire aviation organisation in South Africa thus fell under the DAS.

The post of DAS was abolished on 30 April 1933 and on the following day Col Pierre van Ryneveld was promoted to Brigadier-General and appointed Chief of the General Staff. There was thus no chief of the SAAF and it remained under Van Ryneveld's direct control until 30 June 1939. ([http://www.af.mil.za/about\\_us/history.html](http://www.af.mil.za/about_us/history.html))

## Notes on "Civil Aviation"

January 1915 : UK War Office - Admiralty wants new twin engine bomber. Handley Page L.200 is re-designed and called O/100. 1915 the British Army Council suggests that the Dominions raise their own air units for service within the Royal Flying Corps.

February 1915, the CAC had disappeared and Janney, back in Canada, had launched himself on a career as a con man. No Canadian air force would appear until the closing months of the war, and even that would not see combat - See more at: <https://legionmagazine.com/en/2015/06/canadian-flyers-go-to-war/#sthash.Nujh0vay.dpuf>

1915 : Howard Vincent Reid transfers from the Royal Newfoundland Regiment to the Royal Flying Corps. At least 14 of the Royal Newfoundland Regiment became members of the RFC, - See more at: <https://legionmagazine.com/en/2006/11/the-flying-newfoundlanders/#sthash.Iq96YWOW.dpuf>

Joseph Daymond of St. John's, Newfoundland wounded July 1, 1916, discharged from Royal Newfoundland Regiment. Applies to join the RFC in Canada. Roy S. Grandy, transfers from the Royal Newfoundland Regiment to the Royal Flying Corps, leaves the Canadian Air Force in 1923 to try his hand at commercial flying before returning to the RCAF in 1925. - See more at: <https://legionmagazine.com/en/2006/11/the-flying-newfoundlanders/#sthash.Iq96YWOW.dpuf>

Redford Henry Mulock of Winnipeg, a McGill graduate in electrical engineering, arrived in October 1915 as an acting corporal in a cavalry unit. By January 1915, he had received a discharge from the CEF and joined the Royal Naval Air Service, an unusual path. By November 1918, he was a colonel—the highest rank attained by any Canadian in the wartime RAF—and in command of a force of Handley-Page V/1500 heavy bombers that were waiting for suitable weather to attack Berlin. - See more at: <https://legionmagazine.com/en/2015/06/canadian-flyers-go-to-war/#sthash.Nujh0vay.dpuf>

7 May 1915 the Canadian Aviation Corps ceases to exist.

25 August 1915 : Hugh Trenchard promoted Brigadier-General & appointed "Officer Commanding - RFC, in the Field". RFC now now a "Fighting Force" instead of observe and report.

December 1915 : Handley Page O/100 test flown.

1915 : At this initial stage of the movement, therefore, technical education in Canada is dealt with from the standpoint both of industrial needs and professional requirements. The former must of necessity be met by local agencies; on the contrary, young men aspiring to the higher technical careers have many inducements to complete their education in foreign countries. Representatives from the principal universities in Canada met at Toronto in the summer of 1915 to confer on this subject. At the conference it was declared "that at present the facilities for pursuing postgraduate courses, especially those dealing with technical matters, are extremely limited in Canada, and that large numbers of Canadian graduates go abroad and spend their time and money in foreign universities"

The opinion was expressed that "if postgraduate facilities were provided, this annual emigration would be gradually lessened and many students who remain abroad permanently after completing their courses would be encouraged to take up their residence in Canada."

### ADMISSION REQUIREMENTS FOR Canadian UNIVERSITY DEPARTMENTS.

In the several universities of Canada that have made provision for advanced technical education the admission standards are the same as those which lead to the liberal professions, the qualification of applicants being tested by an entrance examination covering the subjects of secondary education.

The duration of *the technical courses* is the same in all cases, i. e., *four years*, and in general the *courses are organized as a section of the faculty of applied science*.

Exception should be noted in the case of Laval University, Quebec, which provides for the technical studies in the affiliated polytechnic school at Montreal.

The following statement pertaining to the University of Toronto not only shows the scope of the technical education provided in that institution, but is fairly representative of the corresponding work in the other universities.

### UNIVERSITY OF TORONTO—FACULTY OF APPLIED SCIENCE AND ENGINEERING.

In 1877 the Provincial Government established what was known

## Notes on "Civil Aviation"

as the Ontario School of Practical Science, which in 1900, under enactment of University Senate, became the faculty of applied science and engineering of the University of Toronto. At present the faculty has at its disposal four buildings well equipped with the apparatus requisite for thorough training in the engineering professions. Candidates for admission to this faculty must be 17 years of age and must have completed at least four, usually five, years' preparation in a high school of the Province of Ontario, the last year being devoted especially to higher mathematics. The subjects covered by the high-school course are

:

- (1) Compulsory: English, history, mathematics, grammar.
- (2) Optional: Three chosen from Latin, Greek, German, French science (modern and science preferred).

The faculty of applied science and engineering comprises the following courses: Civil, mining, mechanical, electrical, chemical, and metallurgical engineering, architecture and applied chemistry.

The course in each is of four years' duration and leads to the degree of bachelor of applied science.

The average time given to instruction includes lectures 14 hours per week, laboratory 22 hours per week. In order to secure the bachelor's degree the student must successfully pass the examination in the work of each of the four years of the course, including both theoretic instruction and practical exercises.

The elaboration of the technical courses is illustrated by the following particulars relating to civil engineering, which is selected as typical:

First Year Subjects: Mathematics; surveying, including fieldwork; physics (statics and dynamics); chemistry; commercial accounting; a modern language and drawing.

Second Year Subjects: Mathematics; astronomy; surveying, including fieldwork; mechanics; physics and chemistry, including laboratory work; mineralogy; banking; a modern language; drawing.

Third Year Subjects: Mathematics; astronomy and geodesy; surveying, with fieldwork; hydraulics; theory of structures; materials of construction, with laboratory work

;

engineering chemistry; geodesy; photography; physics; drawing.

Fourth Year Subjects; Theory of structures and materials of construction, with laboratory work; electricity; thermodynamics; geology, contracts and specifications; thesis on an approved technical subject, and one of (a) astronomy and geodesy, (b) sanitary and highway engineering, (c) structural engineering, (d) strength of materials and railway engineering. The student may specialize on one of the options. Particularly in the final year the practical side of the subjects treated is emphasized.'

Robert Alexander Falconer – 1907-1932 U of T - Presbyterian convictions ... In his inaugural address a century ago, former University of Toronto president Robert Falconer emphasized the importance of civic service. "I believe that the nation should look to universities for distinct help in the present social conditions," he said from the Convocation Hall stage, with Prime Minister Wilfrid Laurier in attendance. "It must cause concern to thinking people that there is such an indifference on the part of the well-to-do to take up the burdens of civic and political life. source - <http://magazine.utoronto.ca/editors-note/robert-falconer-u-of-t-community-involvement/>

clergyman, scholar, educator (b at Charlottetown 10 Feb 1867; d at Toronto 4 Nov 1943). Falconer spent much of his youth in Trinidad, where his Presbyterian clergyman father had been posted. He was educated at London and Edinburgh universities, concentrating on classics and philosophy, and pursued postgraduate work at Leipzig, Berlin and Marburg, Germany. In 1892 he was ordained a minister in the Presbyterian Church in Canada and took up a lectureship in New Testament Greek at Pine Hill Divinity Hall, Halifax. Becoming a professor there in 1895, he was appointed principal in 1904. A royal commission appointed to investigate all aspects of the university had found administrative chaos and low morale. It recommended a complete constitutional reorganization and implicitly a new president in 1906. To the surprise of many, the 40-year-old Falconer was asked to replace James **LOUDON**. Much of Falconer's time and energy for the next 2 decades was given to executing the recommendations of the 1906

## Notes on "Civil Aviation"

commission. He inherited a collection of colleges; he left behind him an integrated university that led the country in industrial and scientific, as well as humanistic, research. Source ref - <http://www.thecanadianencyclopedia.ca/en/article/sir-robert-falconer/>

"Francis Vivian Drake was born in London around 1895. While a student there, he left the classrooms in 1914 to join the British cavalry. Soon afterward he transferred in 1915 to the Royal Flying Corps and later was sent to Canada to help form the " Royal Canadian Air Force"

RFC station Long Branch, an airfield located west of Toronto and just east of Port Credit. The airport was originally opened by the Curtiss Flying School, part of the Curtiss Aeroplane and Motor Company, as a pilot training school in 1915. The site became Canada's first military air training school but closed with the end of the war in 1918

Theodore Douglas Hallam - Canadian, learned to fly at the Curtiss School in Hammondsport, NY in 1914, was a private in a machine gun battery in the first Canadian contingent, became a sub-lieutenant in the RNVR serving with an armoured car detachment to the RNAS, sailed for Dardanelles, and in 1915 returned to the Hendon Air Station as acting Flight Lieutenant. He was posted to Felixstowe and became Commanding Officer of the War Flight in 1917

Cadet Ormond Whitby, School of Aeronautics, Toronto, Ont

An important feature of the War in 1916, as in the preceding period, was the continued loss of men of noble families and historic names. The British aristocracy was being depleted by the death of its members and sons.

Amongst the sons of famous families who fell\* during this year were the following :

Lieut. Ivan Campbell grandson of The 8th Duke of Argyll.  
Viscount Weymouth son and heir of The Marquess of Bath.  
Lieut. Raymond Asquith Eldest son of The Premier.  
Lieut. The Hon. G-. J. Goschen Son and Heir of Viscount Goschen.  
Lieut. The Hon. Harold Tennyson, E.N. son of Lord Tennyson.  
Capt. Lord Desmond Fitzgerald brother of The Duke of Leinster.  
Capt. The Hon. R. S. A. Palmer son of The Earl of Selborne.  
Capt. The Hon. J. C. W. Saville-Poljambe brother of The Earl of Liverpool.  
Lieut.-Com. The Hon. H. C. R. Fielding son of The Earl of Denbigh.  
Capt. The Hon. J. B. Campbell son and heir of. Lord Stratheden and Campbell.  
Lieut.-Col. Arthur Lister Nephew of Lord Lister.  
Lieut. The Viscount Clive son of The Earl of Powis.  
Lieut. The Hon. V. S. T. Harmsworth, son of Lord Rothermere.

General the Earl of Longford, Capt. Lord Petre and Major Lord Llangattock, were amongst the Peers killed,

Lord Tennyson not only lost a son but a second son was wounded twice during the year.

Up to Aug, 31, 1916, ten Peers had been killed, 18 wounded and 11 taken prisoners; 240 altogether (out of about 600 members of the House of Lords) were on active service and 28 had been mentioned in despatches.  
The House of Commons record showed to the same date 215 members who were or had been at the Front, with 8 killed, 14 wounded and 4 prisoners of war, while 31 had been mentioned in despatches.  
Dehrett's list or roll of honour, at the close of 1916, of the sons of families mentioned in its pages, who had lost their lives, was 1,450 including one member of the Royal family, 14 peers, 21 baronets, 9 members of Parliament, 200 knights, 114 sons of peers, 110 sons of baronets and 150 sons of knights.

So far as Great Britain and practical war-results were concerned the Zeppelin policy and raids up to the close of 1916 were distinct failures.

While killing 127 non-combatants, 92 women and 57 children up to Mar. 1 of 1916 year they had served no military or strategical purpose though costing Germany large sums of money to build and maintain.

It would seem, also, that no single detail in the War so helped recruiting and so strengthened Lord Kitchener's hand as did the 24 raids up to this time. As with Zeppelins so with enemy Aeroplane raids.

## Notes on "Civil Aviation"

On Feb. 22 1916 it was stated in London that 80 Zeppelins were then in commission and that 25 had, so far, been destroyed by the Allies. Meantime Britain had been making gigantic efforts to meet the situation, defend rural England and London itself, supply the Navy with Aeroplane scouts and give the Army eyes which would see the enemy-side and act, also, as guards over the British trenches.

At first she was greatly behind others in this branch of defence and offence ; then matters slowly improved and, as young men of eagle sight and courage poured into the Royal Flying Corps and the War Office put its constructive energy into the effort, the progress became phenomenal.

Speaking at Edinburgh on Sept. 12, 1916, Lord Montagu dealt with the slowest part of this development when he pointed out that in 40 Zeppelin raids, with 120 airships in defence, the first Zeppelin had only just been brought down on British soil.\* As to the Army it was different and the military branch in France had recently brought down 27 Fokkers —the new and improved German machine—and were then masters of the air.

It was stated a little before this that during a specific period the Allies had crossed the German lines 1,227 times and the Germans had come back 310 times. The French had been the first to specialize in these machines and they had one of different qualities for each of varied kinds of work—a line which the British quickly imitated. Then came air-squadrons and great air battles, or bombardment expeditions to German military centres with big planes carrying machine-guns and bombs. A special British development was the artillery observation machine equipped with wireless and reporting the effect of artillery fire on enemy lines. Lieut. Floyd Faulkner, r.f.c, of Toronto, stated in New York on Dec. 31 that "The machines used on the battle-front are much in advance of any used over here, A new machine, whose name may not be mentioned, makes 138 miles an hour and is only arriving at the Front now. It can ascend straight up without banking, and has reached 15,000 feet in seven and a half minutes. This makes it the ideal machine for Zeppelin work, as it can get height quickly enough to catch the dirigibles. It is the greatest fighting machine in the world, and wUl guarantee that we maintain the supremacy of the air, so necessary in this war.

Meanwhile there had been much discussion in England over the failure of the Aerial Service, up to the middle of the year, in eliminating the Zeppelin. It was forgotten that British attacks and skill in defence, if they did not capture or destroy the enemy, did drive the Zeppelins away, prevent serious damage and save the historic buildings, great munition plants and famous cities of the country. An Air Board had been established on May 24 with Lord Curzon as President, and Lord Sydenham, Admirals Tudor and Vaughan-Lee, Generals Sir D. Henderson and Branker, Major Baird, m.p., as members. It was to think out and formulate a policy of defence and took the place of a Committee which had little real power. Difficulties between the military and naval wings of the service still continued, however, and it was not till the latter part of the year that organization, initiation, construction and training of men had combined to evolve a wonderfully complete and effective system,—which between June 1 and Dec. 1 resulted in the destruction of 666 German machines compared with the loss of 203 British and 198 French. In December, 1916, Lord Cowdray of Midhurst became Chairman of the Air Board.

26th January "Baby" floatplanes Nos.8152 & 8153 are tested by Harry Hawker at Felixstowe. The next day he is at Yarmouth acceptance testing Nos.8149, 8150, 8156 & 8157 and "Schneider" No.3776. No.8149 suffers an engine failure. He stays another night to accept "Baby" floatplanes Nos.8163 & 8164 at Yarmouth on 28th January. Whilst five of these arrived very recently, four have been waiting over two weeks.

The full pro-forma report of the 24th January trials of the first Sopwith "LCT 1½ Strutter" signed by Lieutenant Colonel D Pitcher Commandant of the Central Flying School at Upavon has arrived at RFC Headquarters in London and is despatched on 29th January 1916 to Major-General Trenchard commanding the RFC in France. In the report the Basic Description includes: "Wing span 33'7", Tail span 13'6", Fuel 40 galls, Oil 10 galls, Weight full tanks and equipment no crew 1502 lbs". It continues with Further Particulars: "Empenage (tailplane) is bodily adjustable from the pilot's seat. Bombs can be carried under passenger seat without ballast and empenage adjusted after release. Bomb sight is almost impossible to use with the present wings. Passenger seat swivels with provision for a circular gun mounting. Facilities for firing by passenger: Upwards Good, Downwards Fair, To the rear Good. Planes have only one pair of outside struts and no lift wires are fitted under the bottom plane. The factor of safety would appear very low if one of these struts be shot away or damaged. Air brakes are fitted to lower planes close to fuselage. In action they cause a lot of vibration. The engine cowl is of very light metal and easily cracks and

## Notes on "Civil Aviation"

dents. The gun complete with jacket was mounted about 30° to the centre line pointing forward strapped to the circular rail. Time to prepare engine for starting: 1-2 mins." Speed trial: "Wind: West 15 mph, Weather: Fine, Passenger: 11½ stone, Test height: 6-10 feet, Course: 4026 feet, Average speed without gun: 107.2 mph, with gun 105.1 mph, Minimum speed: about 55mph on ASI." Climbing trials: Time to height & rate of climb over latest 1,000 feet in ft per min: 2,000ft 2mins 1,000; 4,000ft 5m5secs 670; 6,000ft 8m45s 630; 8,000ft 15m5s 385; 10,000ft 21m 310; 12,000ft 28m 285; 14,000ft 50m 63. Suggestions for improvement of design: "The machine gets off easily and quickly and is undoubtedly fast, a good climber and easy to fly. She is very nearly automatically stable; far more so than most so called stable machines other than the BE2c. The machine is easy to land but requires an abnormal amount of landing room and could only be landed by average pilots (even with air brakes on) in very large fields. The air brakes make a difference of almost 100 yards. Wheels are much too far back and would (be) certain to turn machine over in plough (sic) or heavy ground. Possibly the shifting forward would reduce landing run."

On 19th July after only five days with 70 Sqdn "1½ Strutter" A386 is in combat with enemy aircraft near Cambrai and is lost in action, both Lt Hele-Shaw and 2nd Lt Oakes are killed.

After failing to get a uniform minimum wage of 1/- (1 shilling) an hour for all woodworkers in the aviation industry the London District Committee of Trade Unions have made a further demand that the same rates are paid as in the building trade: a minimum 11½ pence an hour for woodworkers and wood machinists and a minimum 1/- an hour for spindle hands. This has again been rejected by the companies including Sopwith and passed to the Board of Trade Committee on Production who, on 17th July, conclude that "rates should not necessarily be linked to those paid in the building industry where many employment conditions are dissimilar".

Nationally there is deep concern amongst traditional skilled workers that dilution (unskilled people mostly women and boys trained for a specific skilled task) is threatening their jobs and pay rates and jobs for skilled men returning after the war. Exacerbated by Ministry of Munitions circular L2 suggesting women should be earning a minimum £1 a week and urging equal pay for women, this has led to strikes not least on Clydeside in Glasgow from March to mid June. At the Beardmore aircraft factory at Dalmuir where the order for 50 Sopwith "Pups" has now been confirmed, demarcation disputes have led to the employment of Belgian refugees on sheet metal work. However, the use of dilutees is seen by many as inevitable and accepted on promises or understandings that they will be first to go when the war ends and any available skilled men will be taken on.

1 April 1916 : The Royal Naval Air Service Central Training Establishment Cranwell opens under the command of Commodore Godfrey Paine CB MVO Royal Navy. Cranwell includes a Boys' Training Wing to train young RNAS ratings as air mechanics and riggers.

17 May 1916 : (St. Andre') <sup>78</sup> — We started for St . Omer at 9 for the First Aircraft Depot "1st A.D", the First Aircraft Depot at Candas, a village which is on the way to Amiens.

We arrived about an hour later .

One Bristol is now ready, and will be sent with overhead top gun-mounting to No . 11 . Squadron.

This news was wired from the First A.D. Another wire was sent asking whether they can send us from home one of the Sopwith interrupters .

The Nieuport seat is to be altered—for an eccentric one .

The wire less transmitter is to go at the back of the observer's seat if the lip can be cut away.

There were many other notes made at the Depot and still more at the Squadrons .

No . 29 Squadron . The Squadron had been mixing French and English gear in the Monosoupape engine Not having all English gear they put in all French gear. This practice is to cease . But how and why did they get French gear? That is the question. The Squadron didn't know whether the parts were English or French. No French spares are to be used unless they have no English ones , and then the G.O.C. is to be informed. All French gear is to be returned.  
Sparkling plugs are giving trouble .

---

<sup>78</sup> Personal recollection of RFC Officer MAURICE BARING in his account of the War 1914-1918 " RFC Headquarters. G.Bell and Sons Portugal St. London WC2 pp

## Notes on "Civil Aviation"

The First A.D. was wired to for English cam- gear. French spares , which had not been intended for , had been sent . Satellite-wheels which were really English were sent out as French.

Bronze obdurator rings were wanted instead of brass ones .

An endurance test for the tankage of the De Hav. is to be done at once .

At No . 6 Squadron the Le Rhone engine , No . 5311, was not working well .

R.A.F. wires were reported almost invariably bent when new.

At No. 1 the question of putting fabric over the hinges of the planes (as in the Morane biplane) was discussed. They have only one Le Prieur sight .

What has happened to the 19 others ? No. 7 Squadron were one machine short . Other points that cropped up were the throttling of the 110hp Le Rhone parachute flares that failed to go off split pins that were not supplied when asked for and the lamentable case of a Bristol that was sent to No . 13

Squadron and put every bullet into its propeller with the Vickers gun! it not having been fired at the Depot , and another sad case of a machine which was received from the Depot yesterday, rigged completely wrong, and in which the engine vibrated badly; but this is not nearly all...

by 1918 there were 500 RNAS boys in training at Cranwell, with numbers planned to rise to 1,500.

With the formation of the RAF in April 1918, boys' training was to be concentrated at Cranwell but, as the new brick buildings at East Camp were not yet completed, tents were used for the 300-plus RFC boys who arrived in April – from Halton of all places.

In time the boys' numbers were to rise to a total of 2,500.

Prince Albert was appointed to RNAS CTE Cranwell on 1 January 1918, and arrived in February 1918. He served initially as Officer in Charge of Boys, and later as OC 4 Sqn in West Camp. became the first member of the Royal Family to gain his pilot's certificate. He was also the only member of the Royal Family (and future King) to be married in RAF uniform.

RAF Boy Mechanic and Apprentice Training, 1918-1926 the new Air Ministry intended from the outset to create a permanent home for technical training at Halton it was decided to use Cranwell for the training of boys for the RAF until there was enough permanent accommodation at Halton.

Plans called for a student population of 2,000, with an instructional staff of 25 officers and 340 airmen.

The new barrack blocks and other accommodation, begun by the RNAS, provided the wherewithal to do this, giving the boys (for the first time) hot water, real beds, mattresses and sheets. Prince Albert's Boys' Wing became a Boy Mechanics School and then a Boys' Training Wing, before being renamed as No 2 School of Technical Training (Boys) in March 1920. In April 1921 it became the Boys' Wing of the Cadet College Cranwell, which remained its name until October 1925 when it became No 4 (Apprentices) Wing.

### The Apprentice Scheme

(originally known as the Boy Mechanic Scheme) was promulgated to local education authorities in November 1919, and formally opened on 26 April 1920.

Boys were nominated by these authorities, or by certain schools, to undertake an examination set by the Civil Service Commissioners at one of 15 regional sites.

Those successful in the four-part examination (mathematics, experimental science, English, and a general paper) would be medically examined and attested for 10 years' regular service with a further two years in the reserve.

The first entry of 235 boys, selected against 300 vacancies with plans for 1,000 per year, set off for Cranwell on 18 January

## Notes on "Civil Aviation"

1921.

Their food, lodging and uniforms were provided free, and they were paid 1/6 per day if under 18, and 3/- per day if over 18.

Other rates of pay in 1921 for comparison were:

Aircraftman 2nd Class: 4/-

Corporal: 7/9

Sergeant Major 1st Class: 13/-

Cadet: 5/-

Flying Officer: £1 3/-

Wing Commander: £2

Air Chief Marshal: £7

If desired, boys could buy themselves out of the Service for £20 within the first three months, rising to £100 thereafter.

These first Boy Mechanics (the term Aircraft Apprentice was not adopted until the move to Halton) were taught two groups of school subjects. The first group comprised English, literature and history; and the second group consisted of mathematics, physics and theory of flight.

The boys also received practical workshop training in repair and maintenance, initially in the old RNAS workshops in West Camp.

Indications are that the latter was broader, though not as thorough, as the training that would be provided at Halton.

There were regular sporting contacts, but virtually no social interaction – in those days officers and airmen seldom met except on duty. In fact, the airmen seemed to be extremely conscious of their status and certain well-defined rights that officers were at pains to respect.

The typical working routine consisted of: working in classrooms and workshops Monday to Friday, except for Wednesday afternoon sports; Saturday morning – drill, and inspections of boys and barrack blocks; and Sunday morning – church parade.

Boys were allowed out of camp on Wednesday afternoon after obligatory sports, and on Saturday and Sunday afternoons.

Boys over 18 were allowed to smoke, but only while off camp.

Air experience - flying for boys was provided on the North Airfield in the Boys' Wing's own aircraft – a Vickers Vimy, a DH9A, 2 Avro 504s, and a Bristol Fighter with a Falcon III engine. Cranwell remained 'overspill' for apprentice fitters and riggers until 1926. In 1924 there were still 981 boys in training at Cranwell, as by December of that year there was still only accommodation at Halton for 2,000 apprentices against the eventual need for 4,000. In October 1925, the Boys' Wing became No 4 (Apprentice) Wing and the last remaining Apprentices (Entries 9-14) moved from Cranwell to Halton in August 1926 – taking with them the tradition of the apprentice Pipe Band. All apprentice training was now concentrated at Halton, with the exception of electrical and wireless training at Flowerdown, near Winchester, and armament and gunnery training at

Eastchurch, near Chatham in Kent.  
The last entry to complete training at Cranwell was No 8, among whose 600 boys was Frank Whittle, who had joined as an apprentice rigger in September 1923. Whittle was amongst 18 Cranwell boys who were awarded cadetships at the Cadet College; three of these went on to win College Prizes, and one was the first aircraft apprentice to be awarded a Wakefield Scholarship to the College. The Cranwell boys' Wing had also produced over 60 corporals and some 600 Leading Aircraftmen (LACs) between 1920 and 1926.  
With the departure of No 4 (Apprentice) Wing in 1926 there was no Boy or Apprentice training at Cranwell until the arrival in August 1929 of the Electrical and Wireless School (E&WS) from RAF Flowerdown. an RFC School for Wireless Operators was formed in 1915 in the Town Hall in South Farnborough. In 1918 with the formation of the RAF these units were combined to become No 1 (T) Wireless School RAF at Flowerdown, renamed as the Electrical and Wireless School in July 1919. From 1922 the Electrical and Wireless School played its part in the RAF Apprentice Scheme, with the top 40 apprentices in each intake being sent to Flowerdown for training in what were seen as the most technically challenging trades. it was not until 1929 that the School (at that time coincidentally under the command of Gp Capt A L Godman, who had been the first Assistant Commandant of the RAF Cadet College at Cranwell in 1920-21) moved to East Camp at Cranwell. The Electrical and Wireless School trained officers as well as apprentices, and, from 1934, boy entrants were also introduced after a reorganisation of the electrical and signals trades. By 1936 the School was divided into two wings: No 1 Wing – training airmen as wireless operators (1,103 men under training); and No 2 Wing – 152 aircraft apprentices training as Instrument Makers; 573 aircraft apprentices training as wireless operator/mechanics; 575 boy entrants training as wireless operators; officers on the 14-month Officers' Long Signals Courses, and a variety of refresher courses.  
No 1 E&WS had its own aircraft, which flew from the North Airfield at Cranwell. By 1939 these included Westland Wallace and Wapiti, Vickers Valentia, Tiger Moths and Miles Magisters. By the outbreak of war in September 1939 there were 2,500 officers and men under training in East Camp, compared to 150 or so in West Camp. Courses included:

RAFVR Officers Signals 6 months.  
Aircraft Apprentice 2 years.  
W Op/Mech  
Boy Entrants W Op 1 year.  
Airmen W Op/Mech 32 weeks.  
Airmen W Mech 8 weeks.  
Air Gunners W Op 12 weeks.  
Airmen Teleprinter Op 5 weeks.

Nobel Prize winner 1979 received the  
Nobel Prize for Medicine for his work on  
computer-assisted tomography – what we  
know today as the CAT body scanner.  
Cpl (sir) Godfrey Hounsfield was a Radar  
Mechanic Instructor at Cranwell where,  
in his spare time, he sat and passed the City and Guilds examination in Radio  
Communications.

T E Lawrence served at Cranwell as AC2  
Shaw 1925-26, and observed: "But there is  
rising up a second category of airman, the  
Boy Apprentice . . . Soon the ex-boy will be  
the majority, and the RAF I knew will be  
superseded and forgotten . . . The airmen  
of the future will not be owned, body and  
soul, by their service. Rather, they will be  
the service, maintaining it, and their rights  
in it, as one with the officers . . . The ex-Boys  
are professionally in the RAF as a privilege,  
making it their home. Soon, when they  
have made their style felt, officers will only  
enter their airmen's rooms accompanied,  
by invitation, guest-like and bare-headed,  
like us in an officers' mess . . . The era of  
a real partnership in our very difficult  
achievement must come, if progress is to  
be lasting."

source : RAF SOTA Vol 3 No 1-2, 2008 Boy and Apprentice Training at Cranwell 1916-1952 By Wg Cdr Andy Tait.

February 1916 : during this period a minor agitation was going on against the use of poisonous dope in air-craft factories. Numerous aircraft workers had died from its effects. An official letter had been sent out "desiring" that dopes other than those, supplied by the Royal Aircraft Factory should not be used, and this despite the fact that dopes absolutely free from poison actually existed. - The Aeroplane, January 1917 - review of the previous year.

On **9<sup>th</sup> March 1916** the London District Trade Union Committee for Aircraft Industry writes to Sir George Askwith at the Ministry of Labour Industrial Department. They list the fifty-five "aircraft companies" in London (including Sopwith) that they wrote to on 22<sup>nd</sup> February with an application for an extra 2p per hour for workers earning 1s or more per hour and 3p extra for those earning less than 1s per hour. "The companies have made no promise to pay workers in accordance with this application. We therefore request that the matter be referred for settlement in accordance with the provisions of the Munitions of War Acts 1915 & 1916." This application for more pay for "woodworkers and erectors, woodworking machinists and men working on fabric, doping and polishing" is the Trade Unions' latest move following Sir George's Board of Trade Committee rejection of their previous application for standardised rates of pay for all aircraft workers. (source : <http://www.kingstonaviation.org/100-years-ago/1916.html>)

## Notes on "Civil Aviation"

13th March 1916 : The prototype Sopwith 80hp single-seat Scout biplane has now been with the Admiralty for testing and their single-page report reveals extraordinary performance for its modest power. Speeds between 106 and 110mph are recorded at heights up to 10,000ft and it reaches 5,000ft in 5 minutes. "This machine is remarkable for its performance, ease of handling and for the quickness with which it can be manoeuvred. It is easy to land, landing at from 25 to 30mph." They go on to confirm "the view is equal to that of the Nieuport except straight down" and record "that propeller clearance is very slight but later machines will have a higher chassis, double streamlined wires and an adjustable tailplane to compensate for the weight of different pilots." "The Vickers gun 500 round belt is fitted outside the fuselage along the top of the (engine) cowl and trued through the propeller". This is the first record of a machine gun mounted to fire through the propeller on a Sopwith machine. Sopwith foreman Harry Kauper is developing a mechanical synchronising mechanism which only allows the gun to fire when the propeller is out of the way. Vickers-Challenger and Scarff-Dibovsky are similar mechanisms urgently being produced to emulate those which have proved so effective on the German Fokker Eindeckers. The Admiralty immediately sets about purchasing this prototype 80hp Scout from Sopwith. Their test report is sent to the Royal Flying Corps and forwarded to Maj Gen Hugh Trenchard General Officer Commanding the RFC in France who pencils a margin note addressed to his Quartermaster General "Let us get a squadron of these". (source : <http://www.kingstonaviation.org/100-years-ago/1916.html>)

Sunday **19th March** 1916 : a "Schneider" from Westgate and "Baby" from Grain are amongst 30 aircraft sent out to intercept six German floatplanes which attack Dover, Deal and Ramsgate in broad daylight killing 14 and injuring 26. After the first 'air battle' witnessed by civilians, two Germans are eventually forced down at sea. The performance tests and fighting potential of the Sopwith "1½ Strutters" have caused quite a stir in the Royal Flying Corps as well as the Royal Naval Air Service. The RFC are ready to place significant orders but Sopwith are a primary Admiralty supplier and already running behind with their ambitious programme of deliveries to the RNAS. Consequently Sopwith have negotiated a royalty agreement with Ruston Proctor in Lincoln to allow them to build "1½ Strutters" for the RFC. Like Robey & Co who have been building 30 Sopwith Gunbuses, Ruston Proctor & Co are a long established agricultural and general engineering company. Ruston Proctor are larger with works covering 100 acres and over 5,000 employees. Since January 1915 they have built 100 Royal Aircraft Factory BE2c two-seaters for the RFC and are now working on an order for 100 BE2d and BE2e variants.

On **27th and 29th March** 1916 : the Royal Flying Corps' Central Flying School at Upavon conduct their own performance tests on the prototype 80hp Le Rhône powered Sopwith Scout. They report slightly lower performance than the recent RNAS tests. A top speed at ground level of 101.9mph with full tanks, a 12 stone pilot and a 15 mph cross wind is still impressive with such modest power, as are the 53secs climb to 1,000ft, 5mins 10secs to 5,000ft, 13mins 10secs to 10,000ft and 25mins to 15,000ft. Maj Gen Hugh Trenchard has already written that "We should have a squadron of these" in France and these tests may be an essential step towards the RFC placing an order. **27th March** the Admiralty report on outstanding aircraft orders and "anticipated deliveries" includes: Sopwith "Type 860" large floatplanes: 8 only delivered of last 12, orders held pending further alterations. Robey built Sopwith "Type 806" gunbuses: 22 delivered of 30, 8 waiting accommodation. Sopwith "Baby" floatplanes: 86 delivered of 100 - 1 promised 1/4/16 & 3 per wk. Sopwith "1½ Strutters": 6 delivered of 50 with another 102 to follow - 3 promised 1/4 & 3 by 8/4/16. Remarkably Sopwith have now been instructed to deliver 30 of the Admiralty "1½ Strutters" directly to the RFC. **31st March** six German Navy and Army Zeppelins bomb London and East Anglia killing 48 and injuring 64 people. RNAS Yarmouth get no early warning due to gale damaged telephone lines so the only Sopwith response is a fruitless early morning patrol by "Baby" No.8163. There are 24 defence sorties overnight by the RNAS & RFC, one pilot is killed taking off in mist and at least 6 aircraft are wrecked but three pilots do see L15, one gets in some shots and another drops Ranken darts onto her. She is one of two hit by anti-aircraft fire and lands broken-backed off Margate. The crew less one who drowns are captured by a British destroyer. **10th April** the seventh "1½ Strutter" RNAS No. 9381 arrives at Brooklands for testing. This is the first to be re-allocated to RFC (Military Wing) from Sopwith's RNAS order and will have to be re-painted with the RFC serial number 7942. The Admiralty has been convinced of the RFC's greater need for some of these fast long-range two-seaters having been told of the secret plans for a major offensive in the summer by British and French Armies on the Western Front. Deliveries from Ruston, Proctor & Co against the RFC's own order cannot possibly be made in time. The planned summer offensive in the Somme has the additional important aim of drawing German forces from the Eastern Front to relieve the overwhelming pressure on the Russian allies. There is a story going around that the RFC's recently appointed Director of Air Operations, Brig Gen Sefton Brancker, has been to Brooklands and when seeing Sopwith's prototype 80hp single-seat Scout alongside the larger two-seat "1½ Strutter" declared - "Good God! Your 1½ Strutter has had a Pup." True or not, the name has stuck and everyone is calling it the Sopwith "Pup". **13th April** sees the first meeting of the recently formed Society of British Aircraft Constructors (SBAC). The Sopwith Aviation Co is a founder member with General Manager R O Cary on the Committee of Management. Aeroplane reports that "practically every firm of standing in the industry has signified its approval of the objects of the society" which are to encourage, promote and protect

## Notes on "Civil Aviation"

the British aircraft industry and protect the general interests of companies, firms and persons engaged therein. Underlying these laudable long term objects is the urgent desire to speak as one to Government about the way excess profits are calculated and the impending increase in the tax on those excess profits to 60%. Excess Profits Tax is popular with the public and the Treasury but very contentious with these rapidly expanding young companies who need to use their profits to expand facilities and purchase equipment possibly beyond any likely commercial requirement once the war is over. The 60% tax is applied to profits in excess of the company's pre-war levels or to profits exceeding 6% of capital employed. For those with no pre-war financial history it is on profits exceeding 9% of capital employed. Noel Pemberton Billing, newly elected Independent MP for East Herts, has started to harangue the Coalition Government with his views on the failings of the Royal Aircraft Factory and the RFC. He is judged by many to have gone too far when declaring that the dependence on BE2 machines and RAF engines is negligence tantamount to the murder of our airmen. His evidence for this is to be assessed by an Air Enquiry Committee. When asked what taxpayers are paying Mervin O'Gorman to run the 3,223 strong Royal Aircraft Factory, the Minister replies that it is £3,000 p.a. with his four senior managers on £450 to £630 p.a. When skilled workers are earning around £150 per annum, the implication is that £3,000 p.a. is a very large salary. It is not generally known that leaders of private aircraft companies are paying themselves up to £10,000 p.a.

May 11, 1916 : The first UK Air Board constituted with Lord Curzon as chairman.

19 May 1916 : Dispatch from General Haig commends the work of the R.F.C., and lays special stress on the development of the technical side of the Corps, such as in photographing, wireless, bombing, and in keeping machines in good condition.

05 July 1916 - The Aeroplane : full particulars are given of flexible stranded steel wire cable made to the special Royal Aircraft Factory specification No. 28a.

05 July 1916 - The Aeroplane : THE M.F.P. STEEL WARPLANE : The type B2 M.F.P. Military Steel Tractor Warplane, built by the Poison Ironworks, of Toronto, Canada, equipped with a 130 h.p. Hall-Scott motor, made a new record in demonstration tests before foreign Government officials at the Hempstead Aerodrome, near New York, on June 6th.

Tliis machine, which is the first all-Canadian war aeroplane, with fuel and oil for four hours' continuous flying, climbed one thousand feet in one minute and twenty seconds with this load, piloted by Mr. Niles.

The speed test was cut short, owing to magneto trouble, so that no official record could be obtained, but those who saw the flights expressed the opinion that the machine showed a speed of over eighty-five miles per hour.

The officials who watched the trials were : —

Captain H. Steensand, Chief Engineer, Royal Dutch Naval Flying Corps, and Lieut. Filbert Cantori, of the Italian Royal Navy.

16 July 1916 - The Aeroplane : the fleet of giant war aeroplanes, ordered by the British Government from the Curtiss Aeroplane Company, was destined to decide the campaign on the Western front." It is said that this statement was made on his arrival on the American liner "St. Paul" by George O. Robinson, who was alleged to belong to the Curtiss Company.

The "N.Y. Times" says ;—"He has been at Hendon, the Loudon aviation base, supervising the assembling of aeroplanes shipped from this country. The largest of these are the "Canada" and "super-Canada" types of machines now being built at Buffalo and Toronto."

26 July 1916 : The Aeroplane : G. B. CockBURN—Britam's only representative at the first Reims Meeting. • Devoted four years and persdhal fortune to flying experiments—six months of which was employed in teaching the first four officers to fly for the Admiralty on Mr. McClean's machines, as there were no naval pilots. Gave instruction free. Lived at Eastchurch at own expense. Has as yet received no thanks from the Lords Commissioners. Later accepted subordinate civilian post under R.F.C. in order to

## Notes on "Civil Aviation"

assist the, late Colonel Fulton, C.B., to form and build up the Aeronautical Inspection Department. Was, with Mr. McClean, the father of the Royal Naval Air Service.

Geoffrey de Havilland—pioneer pilot and designer ; experimented alone, designed, built, and flew his own aeroplane and engine in 1909. Subsequently, when employed by others, designed and flew many of the best aeroplanes ever produced in this or any other country.

Mrs. Hilda Hewlett—the first British woman pilot. Founded one of the first and most successful flying schools, and has since established a successful manufacturing concern.

J. A. D. McCurdy—Canadian pioneer. Flew in 1908 in America and Canada on machines largely of his own design and construction. Has flown regularly ever since, and has done valuable war work in training pilots and constructing aeroplanes.

H. P. Martin—devoted entire time and fortune from 1908 onwards to development of aeroplanes, in conjunction with Mr. Handasyde. Specialised on purity of workmanship and did much to raise the level of British aircraft construction.

J. T. C. Moore-Brabazon—devoted several years and his private fortune to experimenting with aeroplanes. Was the first aviator to fly a mile round a closed circuit on an all-British aeroplane.

Harold Perrin—first secretary of the Roy'al Aero Club. Organised, managed, directed, and generally inspired all rules and regulations concerning flying from its earliest days. Administered laws without fear or favour under very difficult circumstances, and acted generally as the "head-centre" of official aviation for many years. Has contributed valuable work to the regularising and governing of aviation.

Horace, Eustace, and Oswald Short—three brothers. Among the earliest experimenters and builders of modern balloons in Great Britain. Founded in 1909 the first factory built exclusively for aeroplane work in England. Have produced many notable types, including the first multiple-engined aeroplanes. Have led the world in the development of seaplanes.

F. SiGRiST—carried out all Mr. Sopwith's earliest experimental work as chief engineer. Later, as works manager to the Sopwith firm, became, jointly responsible for the development and design of the Sopwith machines.

09 August 1916 : A demonstration was arranged for Major-General Sir Sam Hughes, Canadian Minister of Militia, by Colonel Grant Morgan, Five types of machine were flown by English and Canadian, pilots. The Canadian pilots gave displays in which they proved their right to be considered equal to the best British pilots. Illustrations were given of fighting in the air, and some marvellous loops were made. Great satisfaction was expressed by Sir Sam Hughes and all those who witnessed the flights. Among those

## Notes on "Civil Aviation"

present were Mr. John Aird (Canadian Bank of Commerce), Colonel D. Armour, Mr. F. W. Ashe (Union Bank of Canada), Mr. G. McL. Brown (Canadian Pacific Railway), Colonel Bruce, Major C. Bryan, Mr. C. Gamble (Canadian Bank of Commerce), Commander Sir A.-Trevor Dawson, R.N., Major Garrett, Major-General Howard, Mr. H. H. Hambling, Sir William Peterson, Captain Plumer, Colonel Frank Reid, and Major-General Watson.

16 August 1916 : Three hundred young men (19 to 22) of good education, are required to train as wireless telegraphists for the R.F.C. Application should be made any morning to "the Polytechnic", Regent Street, London.

06 September 1916 : the aeroplane : According to the "Morning Albertan" of Calgary, a Canadian squadron of the Royal Flying Corps is now in action in France, where they have chiefly been doing good work. 100 men of all ranks are on active service, and a number are still in training.

\* \* \*

Miss Katherine Stinson, a well-known American aviatrix, was nearly killed on July 23rd during a flight between Camp Hughes, -Manitoba and Brandon. She made a bad landing after engine failure and smashed her machine, escaping with minor injuries.

October 5, 1916 : Despite civil air operations are banned, George Holt Thomas registers the airline, Aircraft Transport and Travel Ltd.

18 October 1916 - The Aeroplane : The Dominion Government is arranging for the establishment of an aviation school and aeroplane factory in Canada. This action is being taken with the approval and co-operation of the Imperial authorities, who will send a staff of competent men to take charge of the school. The aeroplane factory will be established under the direction of the Imperial Munitions Board, which has assured orders from the Imperial Government while the war continues.

A number of Canadians has already been trained in Canada and the United States by the Curtiss Co. and the Thomas Bros., though it is occasionally difficult to distinguish between these subjects of an effete monarchy and the free-born citizens of the States. Presumably a real Government School, under a real Munitions Board, will manage to bring the cost per pupil up to the necessary Government standard, even if it does not improve the quality of pilot evolved. The Canadians so far received have been rather good, on the average.

08 November 1916 : It is reported from Ottawa that there is no truth in the rumour that Canada is to have an Air Minister of her own. "One regrets it, for anything would be better than following England's example". - Ed. CGCG The Aeroplane.

Aug. 28th 1916 : The "Morning Albertan," of Calgary: Ottawa —Important developments are anticipated from conferences now being held with Hon. J. D. Hazen and members of the Naval Service Department, and Lord Innes Kerr representing the Admiralty. The conferences have to do with the aviation questions and Canada's participation in that branch of the Service. At the close of to-day's conference, the Minister stated that important matters were under consideration, but that nothing could yet be made public."

December 22, 1916

The New UK "Ministries and Secretaries Act" became law. Within this law it was stated that the President of the new Air Board 'shall be deemed to be a Minister appointed under this Act and the Air Board a Ministry established under this Act.

15 July 1916 : William E Boeing starts "Pacific Aero Products".

26 July 1916 : inquiring into the administration and command of the Royal Flying Corps : Colonel Beatty was called in reference to an allegation that Captain Picton Warlow was allowed, or ordered, to fly an old machine which had ceased to be of any value in France, back to England when the machine was in a dangerous condition to fly in.

Colonel Beatty said that he was present at R.F.C headquarters in France when the officer started for England. It was not a question of a man being allowed or ordered to fly back, it was a privilege.

The machine was a two-seater Bleriot with an 80 Gnome engine.

It was obsolete for use in the field, but by no means obsolete for training purposes.

The same type was, he believed, still in use.

He could not definitely recollect how long this actual machine had been in use.

To the best of his recollection it was almost new.

The type at that time was discarded because it could not climb to the height required with a military load.

If it was not a new machine, he could say quite definitely that it would have been overhauled.

## Notes on "Civil Aviation"

The day in question, December 20th, was a very good one, and he was told that England could be seen from the aerodrome. It was clear, but slightly cloudy, with some wind.

The machine was not used for field service, but was perfectly suitable for training purposes.

The journey on which Captain Warlow started should have occupied not more than 1 hour 20 minutes. If a machine got into the clouds for five or ten minutes the best pilot might miss his bearings ; or Channel mists might cause an accident.

The Chairman : When it was decided to discard types of machines which were outclassed by newer types, what was done with the discarded machines ?—A machine which could be of real use for training purposes, whenever possible, was flown to England. If a machine was fit to fly across, then the pilot who was coming across was allowed to fly it.

Q - The Chairman: Who decided as to the fitness of the machine ?

A - Colonel Beatty: The officer in charge of the repair section.

Q - The Chairman: Was a test flight made, or was the machine overhauled ?—

A - Colonel Beatty: Invariably it was tested to make certain that it would fly. Either the officer in charge of the repair section or the officer who was going to fly would test it.

Q - The Chairman: It would go into the repair shop first of all, and then be tested, and if it was found fit to fly, the officer whose turn it was to come to England might fly it over ?

A - Colonel Beatty: He would get permission to do so.

Q - The Chairman: explain how the accident happened,

A - Colonel Beatty: suggested that the officer might have got into a cloud and lost his bearings, and missed England altogether.

Q - General Sir H. Smith-Dorrien : Are there any other occasions on which men have lost their way similarly ?

A - Colonel Beatty: I know a man who lost his way in a bad snow storm - that in the early days of the war a pilot was lost in the same way.

The Chairman then read the proceeding of the Court of Inquiry with reference to the deaths of Captain Downer and Lieutenant

Burrows, who were killed whilst flying a B.E. 4 machine, and respecting whose death allegations that they were due to faulty design or that a bad repair had been made. The evidence given at the inquiry was that the machine was making an abnormally steep spiral descent when the strut broke.

A - Colonel Beatty: The R.a.f only tests the first machine of a type. The first machine of a type is put to very exhaustive tests. As the others came along they were roughly tested by pilots in the air.

Q - The Chairman: Have you special pilots for that duty ?

A - Colonel Beatty: Yes, specially for that work. Contractors were given certain formula to which machines must approximate. A certain climb, speed, and load was specified—a practice which had only been instituted during the last year.

Q - The Chairman: And you test the machines with reference to your specifications ?

A - Colonel Beatty: Yes.

Q - The Chairman: Do you find that the machines substantially comply with specifications ?

A - Colonel Beatty: Yes, very closely.

The Committee then sat in camera.

After the last private sitting on August 1st it was announced that the Report would be issued shortly

## Notes on "Civil Aviation"

1916 : RFC and RNAS accept Canadian Pilot volunteers after a medical check and dispatched to England to receive flight training (no requirement now for holding an Aero Club of America (ACA) certificate) See more at: <https://legionmagazine.com/en/2015/06/canadian-flyers-go-to-war/#sthash.Nujh0vay.dpuf>

1916 : Short Bros. build two airships using duralumin components. Oswald Short believes duralumin far superior than wood for aircraft construction. Oswald extensively tests various duralumin components with the intent of using duralumin for aircraft construction. Many wondered whether or not duralumin would resist corrosion. To prove the metal was up to the task, Oswald affixed duralumin and mild-steel plates to a jetty so that they were exposed at low tide and submerged in the sea at high tide. After nine months, the duralumin had only light surface corrosion, while the steel plates had nearly rusted away.

15 September 1916 : 400 aircraft of the RFC play a major role in the Somme offensive, attacking enemy trenches with machine-gun fire, and eventually winning air superiority over the battlefield. 10 per cent of the pilots engaged at the Somme were Canadians. : <https://legionmagazine.com/en/2005/01/fateful-decisions-on-the-somme/#sthash.4yUr2Xsf.dpuf> - See more at: <https://legionmagazine.com/en/2005/01/fateful-decisions-on-the-somme/#sthash.4yUr2Xsf.dpuf>.

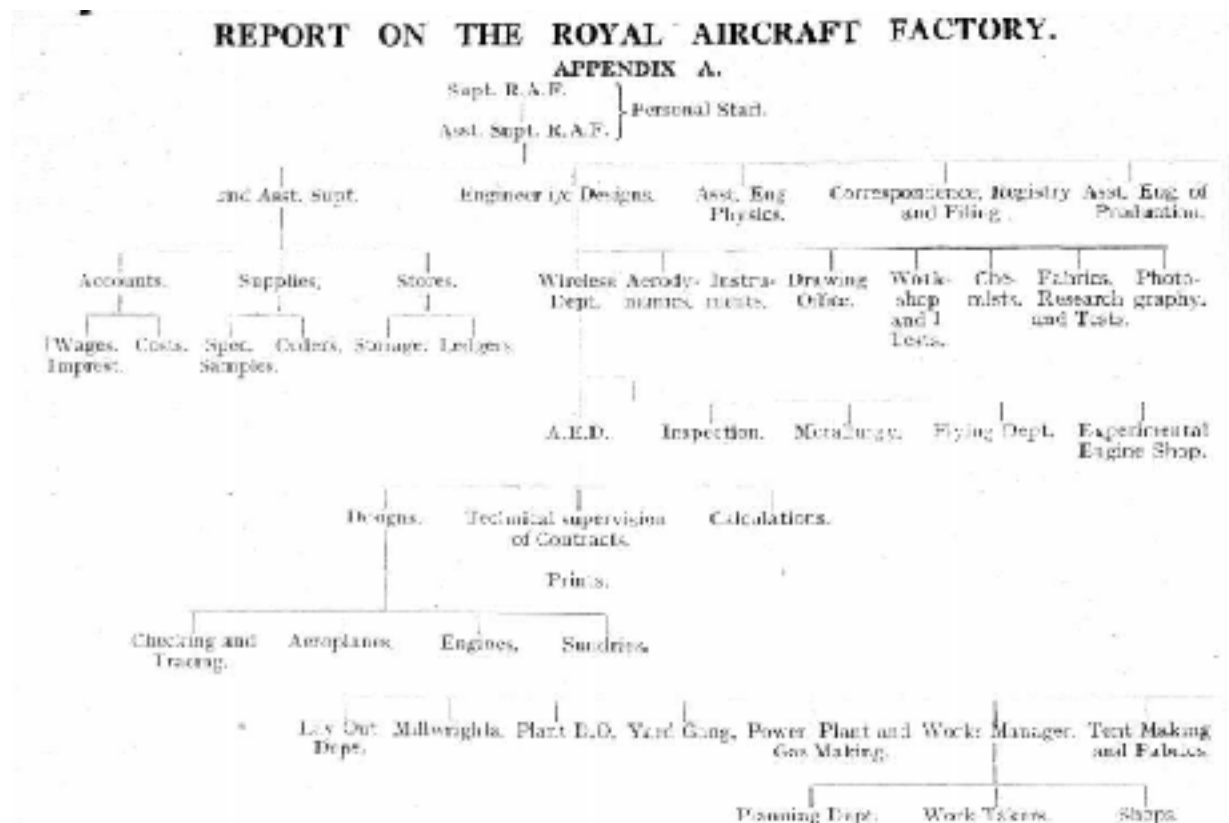

November 1916 : Deliveries of Handley Page 0/100 to RNAS begin.

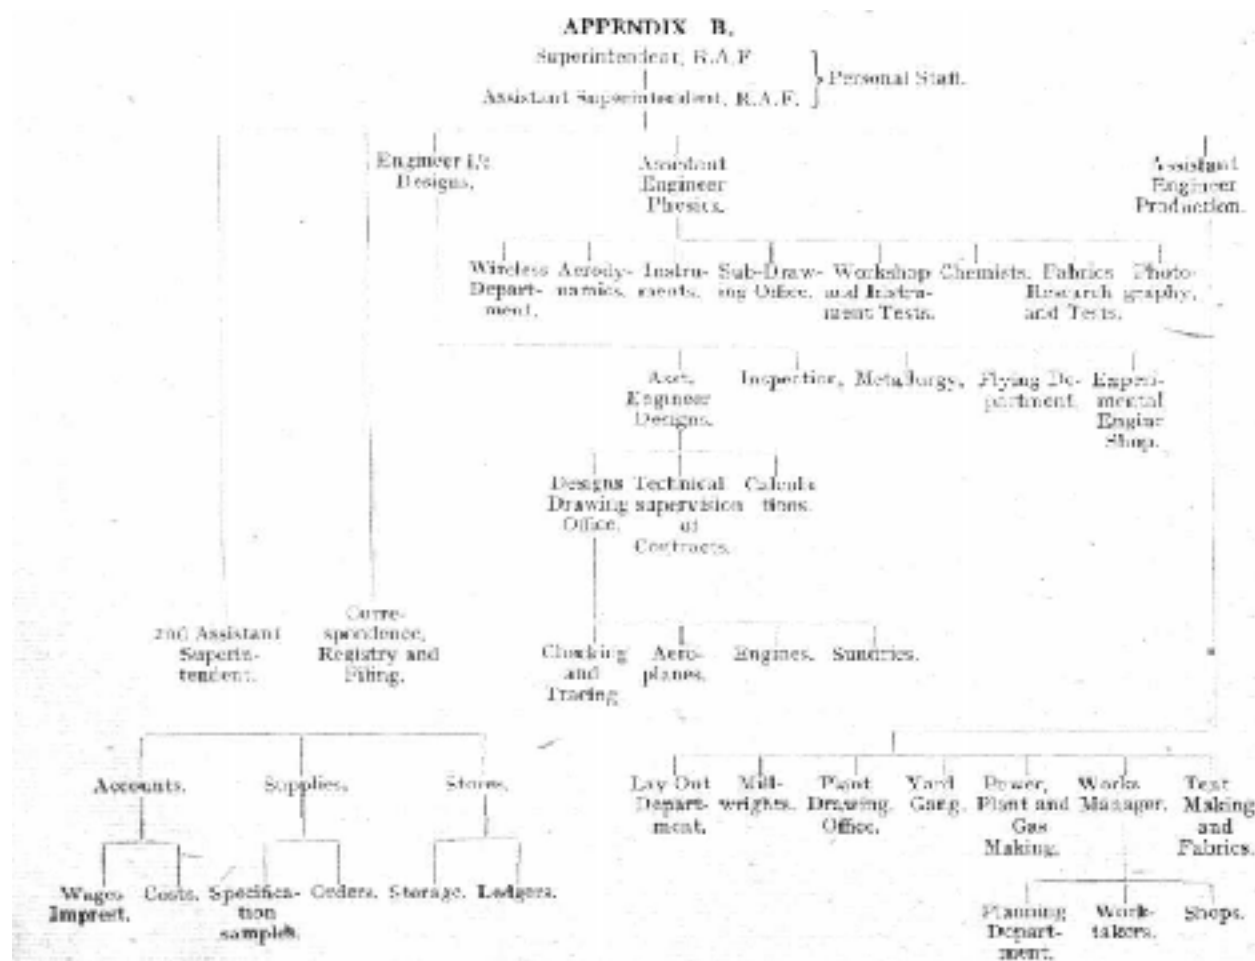

December 1916 : Imperial Munitions Board (IMB) Canada, mandated to provide buildings and equipment through an "aviation department". The result is the Crown Corporation "Canadian Aeroplanes Limited" headed by Frank Wilton Baillie, which purchases Curtiss Aeroplanes and Motors Limited in Toronto.

December 1916 : Handley Page 0/100 re-engined with R.R "Eagle" engines designated 0/400. Ultimately over 400 are built by the end of WW1, resulting in a massive shift of manufacturing methodologies for large scale production.

December 1916 : the Wright-Martin Company primarily interested in recovering the more than \$1,000,000 it had paid for the rights to the Wright brother's patent, notifies other aircraft manufacturers (US or international?) that they would have to pay a royalty of five percent on each aircraft sold, with a minimum annual royalty of \$10,000 per manufacturer. Wright-Martin demanded this royalty on all aircraft, whether they achieved differential lifting by the wing-warping technique of the Wrights or the far more popular ailerons employed by Curtiss.

End 1916 : Informal Canadian RFC Pilot recruits numbered about 350. See more at: <https://legionmagazine.com/en/2015/06/canadian-flyers-go-to-war/#sthash.Nujh0vay.dpuf>

During 1916 ever-increasing investigative work was being undertaken by the British Directorate of Military aeronautics - Dept. of Design - Safety Standards ( Technical Department) to identify the reasons behind the failures of aeroplane structures. Capt. A.P

## Notes on "Civil Aviation"

Thurston, in charge of "Technical Direction, RFC" <sup>79</sup> has been accomplishing static destructive testing of every aeroplane "Type" that the RFC has selected for "Operational Use" by the RFC.

Reports from at least a half-dozen Committee of Enquiry into B.E.2e aircraft accidents - usually while in a dive, where the wings had failed, determined that the wings had collapsed upwards and recommended that "tension wires" be added along the triangular pylon struts supporting the overhang landing wires.

Thru destructive testing of complete airframes in a test jig and analysis of the data obtained, Capt. Thurston identifies that instead of "Tension Failures", the B.E.2e's wing struts had failed in compression from negative air load applied during the dive. This leads to the "strength factors" required under "Down-Loads" to be re-considered.

---

<sup>79</sup> Harald Penrose, British Aviation - The Great War and Armistice 1915 - 1919, Putnam & Co., London 1969. pg. 204 SBN 370-00128-1

CANADIAN AVIATION - 1917

January 1917 : it, was announced that the Canadian Aviation Association, under Col. .Hamilton Merritt, would conduct aviation schools in Canada.

03 January 1917 : many of the best officers at the Air Department going, on active service early in the war, and owing to the absolute necessity for increasing % the personnel of the R.N.A.S. as rapidly as possible, a "number of extremely undesirable persons" worked their way into the Service <sup>80</sup>, not merely in subordinate positions as R.N. and R.N.A.S officers at air stations, but also :

1. as R.N.V.R. officers,
2. attached to the R.N.A.S.,
3. in administrative positions at Whitehall,
4. in technical capacities at Whitehall, and
5. in factories. <sup>81</sup>

As a somewhat natural result, the originally "sound nucleus of officers" of the Royal Navy and of the Royal Regiment of Marines was simply swamped by "new-comers" of a singularly objectionable type, who would never have obtained commissions if the officers who selected the candidates before the war had still been so employed. A craving for cheap advertisement and an atmosphere of intrigue arose.

The R.N.A.S. people at home earned a very bad reputation, both for their behaviour in public and for their lack of use in the war. Some detachments abroad were unduly prominent in the Press, as they were less reticent about their doings than were R.F.C. officers.

And while all this was going on, the officers and men who were labouring silently and earnestly to help in the war, went unknown. <sup>82</sup>

In fact, the officers and men who were labouring silently and earnestly were unknown to such an extent that the so-called "technical people", . naval and civilian, at home, busy with their own intrigues, seem to have forgotten their existence and neglected their needs and their demands for aircraft and engines, and, further, seem to have forgotten that the man on active service knows what he needs very much better than does the man in a chair in Whitehall, who never goes to see the war at close quarters, and who takes excellent care hardly ever to ascend in an aeroplane even over a perfectly good aerodrome at home.

#### British and Colonial.

Fortunately, a number of extraordinarily gallant young men, British and Colonial, also managed to obtain commissions, and, despite their lack of proper training at first, their lack of proper machines to fly, and the lack of a proper policy of warlike operations at Whitehall, and sometimes despite lack of common intelligence on the part of their commanding officers, these youngsters did work in the air which has been worthy of the proudest traditions of the King's Services.

Be it said, however, that since Commander Godfrey Paine left the R.F.C's Central Flying School to devote himself entirely to the training and discipline of Naval aviators there has been "a notable improvement in the general training" and the deportment of the new generation of R.N.A.S. officers.<sup>83</sup>

## Notes on "Civil Aviation"

As a rule, both in Great Britain and in Germany the highest technical schools have developed from schools of the secondary order, although the latter are not regarded as preparatory to the former.<sup>84</sup>

In England provision for the higher orders of technical education has been made in the ancient universities and in technical schools or colleges that have developed up to the university standard.

In the older universities, the technical side is an outcome of provision for scientific research.<sup>85</sup>

The establishment of university colleges in, the great centers of industry and population, and their gradual elevation to the university plane is the most notable event in the history of higher education in England during the last half century.

These institutions were intended to meet local demands, and they all make provision for the various branches of engineering, technology, and agriculture, with the purpose of supplying experts for the conduct of industrial enterprises. Until 1907 the City and Guilds (Engineering) College was entirely independent, was known by the name of the "Central Technical College," and belonged to the City and Guilds of London Institute, by whom its affairs were managed. The City and Guilds (Engineering) College still belongs to the institute, which, instead of managing through a committee of its own, has delegated its powers to what is known as the delegacy of the City and Guilds (Engineering) College.

This delegacy, which was appointed at the time of the federation, consists of eight representatives of the City and Guilds College, eight from the governing body of the Imperial College of Science and Technology, and three representatives from the Goldsmiths' Co.

All the affairs of the college are managed by this delegacy, to whom the entire staff (teaching and otherwise) are responsible. The chairman of the delegacy is Sir John Wolfe Barry, K. C. B., F. R. S., and the dean of the City and Guilds College is Prof. W. E. Dalby, F. R. S.

When the federation was brought into existence, the needs of the engineering college were especially considered, and an extension has been built which has practically doubled its capacity. This extension was erected by funds generously provided by the Goldsmiths' Co. ^ Entrance requirements.—The entrance requirements of the separate colleges are determined according to their individual scope and the interests or purposes of candidates for admission. They are all, however, marked by the same liberal spirit. In general, the colleges receive young men, not under 17 years of age, who have had a good secondary education, and excuse them from the first, second, or third year course according to the standard which they have attained when they present themselves. The decision in this respect is made by the professors particularly concerned.

The conditions for the admission of research students are as follows : A candidate desirous of undertaking original research must have completed an associateship course in one of the departments of the Imperial College, viz, the Royal College of Science, the Royal School of Mines, or the City and Guilds (Engineering) College, or an equivalent course of study elsewhere, and must satisfy the rector and professors as to his qualifications for extended study.

The subject of research will require the approval of the professor of the department in which it is to be carried out. The absence of uniform, rigid entrance requirements accords with the conduct of studies within the federated colleges. The purpose has been to keep them free from academic traditions and the restrictions of fixed syllabi. The general system of classification makes adequate provision for students of different degrees of advancement and having different ends in view. The charter of the Imperial College provided for the coordination of its work with that of the University of London, and in 1908 the college was admitted as a school of the university in the faculties of science and engineering. The ultimate relation of the two great institutions became, therefore, a matter of consideration on the part of the royal commission on university education in London, appointed in 1910.

The opinion was strongly expressed by the commission that, by closer relations with the University of London, the standard of admission to the Imperial College would be raised and thus the college would make a substantial gain. In response to this suggestion it was explained that a movement had already begun on the part of committees of the governing body of the Imperial College to effect this change.

## Notes on "Civil Aviation"

It has even been proposed that the first two years' courses in the college of mining and the college of science should be abandoned. Advanced standards have already been secured in the case of the engineering college, to which students are now admitted by competitive examination. This does not preclude varied degrees of previous attainment, but it insures the choice of the most promising in each particular line of study, a measure necessitated by the excess of applicants for admission.

Examinations are held at the end of each course of instruction and at such other periods as may be deemed necessary.

Diplomas.—The following diplomas are awarded to students who satisfactorily complete the appropriate organized course of study and pass the necessary examinations:

- (a) The Diploma of Membership of the Imperial College of Science and Technology (D. I. C.).
- (5) The Diploma of Associateship of the Royal College of Science (A. R. C. S.).
- (c) The Diploma of Associateship of the Royal School of Mines (A. R. S. M.).
- (d) The Diploma of Associateship of the City and Guilds of London Institute (A. C. G. I.).

Courses of instruction.—The courses of instruction fall mainly under the following heads:

- (1) Diploma Courses. Organized courses of instruction extending over three or four years leading to the diplomas of associateship of the Royal College of Science, the Royal School of Mines, and the City and Guilds of London Institute.
- (2) Special or Partial Courses. Short courses of lectures, with or without laboratory work, of an advanced character dealing with special branches of pure and applied science suitable for those who have graduated or are already engaged in some scientific industrial occupation.
- (3) Advanced Specialized Courses. Research work and specially arranged courses of study in advanced science or technology extending over one or more complete years leading to the diploma of the Imperial College.

The scope of each one of the federated colleges is outlined in the calendar as follows:

Royal College of Science affords complete courses of training, extending over three years, in mathematics, mechanics, physics, chemistry, botany (including the first portions of the Imperial College diploma courses in plant physiology and pathology, and the technology of woods and fibers), zoology, and geology, which may be regarded as complete in themselves or as preliminary to more advanced work in the applications of the subjects in question to industrial problems.

The Imperial College—Royal School of Mines affords complete specialized courses of training, extending over four years, designed adequately to equip a student who desires to follow the profession of a mining, a metallurgical, or an oil engineer.

The Imperial College—City and Guilds (Engineering) College affords complete courses of training, extending over three years, in engineering, arranged to suit the requirements of those preparing for engineering as a profession, or who desire to acquaint themselves with the scientific principles underlying any particular branch of engineering.

In addition, the Imperial College offers special facilities for work of a more advanced character in all the branches of science previously referred to. The advanced student may engage in research work, or attend full-time organized courses of a more advanced character than those forming the normal courses of the three institutions which are integral parts of the Imperial College, or he may attend the college as a part-time student for the purpose of taking up one of the special lecture courses, with or without laboratory work, or a specially arranged course of study whether in pure science or in the application of science to industry.

Such courses include (a) Railway engineering, (b) Structural engineering, (c) Hydraulic engineering, (d) Surveying and geology, (e) Electrical machinery and transformers, (f) Design and erection of chemical plant, (g) Fuel and refractory materials, (h) Technology of woods and fibers, (i) Economic botany, (j) Plant physiology and pathology, (k) Biochemistry, (l) Economic entomology, (m) Comparative pathology, etc.

Equipment for practical work.—The equipment of the department of municipal and sanitary engineering comprises a commodious drawing office, laboratory, and lecture room, and a well-arranged and fully-equipped sanitary engineers' workshop, provided with

modern appliances."

### MANCHESTER MUNICIPAL SCHOOL OF TECHNOLOGY.

Stages of development—The Manchester Municipal School of Technology, developed from the Mechanics Institution founded in that city in 1824, is of university rank and at present recognized as one of the leading technical schools of the world. The course of this development is typical of what has taken place in the case of several other similar institutions in Great Britain. Established as a Mechanics Institution, it occupied for over 13 years the first building expressly designed for such an institution. In 1857 it was removed to larger premises, which were secured mainly by popular subscriptions. In 1852 the institution received contributions toward its maintenance from the City and Guilds of London Institute, which was organized to promote technical education throughout the Kingdom. At the same time the local contributions to the Manchester Institute were greatly increased, and the name was changed to Manchester Technical School. In 1887 this school became a beneficiary under the terms of the will of Sir Joseph Whitworth, who left some £300,000 (\$1,600,000) to legatees for the promotion of technical and art instruction. It was proposed to devote this fund to an institution that should include a technical school, a school of art, and a museum, and to bear the name of Whitworth Institute. Arrangements were made with the governors of the technical school for the consummation of this purpose, which was furthered by the donation of the profits accruing from the Manchester Jubilee Exhibition.

Meanwhile, by the passage of the technical instruction acts of 1889 and 1900, the Manchester city council was empowered to aid technical education out of the rates (property tax), and for this purpose additional taxes amounting to £15,000 a year were also placed at its disposal. In view of the enormous increase of the funds which the city council was prepared to devote to the technical school, it was decided that the council should have full control of the institution. This decision was concurred in by the governors of the Whitworth Institute, and in March, 1892, the technical school, with all its properties, including a large estate that had been offered as a site by the legatees of Sir Joseph Whitworth, was transferred to the municipal corporation. As a consequence of this transfer the school assumed the title of the Municipal School of Technology and entered upon a period of rapid expansion.

In 1905 the school of technology was associated with the University of Manchester, which established a faculty of technology and recognized the principal of the school as dean and the heads of the several departments as professors of the university. Present status.—

In 1912 the school of technology was officially recognized as a college of university rank and included among the higher institutions in Great Britain which received grants from the board of education. The site, buildings, and equipment of the school of technology are now valued at £3,500,000. The annual cost of maintaining the school is approximately £50,000.

Since ascending to the university plane, the teaching and research work of the school of technology have been brought into closer relation with the industries of the district; and the demand for graduates exceeds the supply and is constantly growing.

Organization of courses.—The work of this municipal institution is organized in the interests of three classes of students: Those who wish to complete a full course of technical training, leading to the degree of bachelor of scientific technology; students who contemplate a more

## Notes on "Civil Aviation"

limited course of training; and graduate students either from the Manchester school or from universities. Students entering for the degree courses are required to pass the matriculation examination and a second test, the intermediate examination, which may be deferred until at least a year before entering for the diploma examination.

Certificate courses are also provided for students, which do not require the same entrance examination as the degree courses.

Degree courses.—The division of the Manchester School of Technology which is comparable with the higher technical schools previously considered is comprised in the degree courses. Candidates for admission to this division must pass the matriculation examination which covers the following subjects

:

English language and literature, English history, mathematics, and three of the following subjects, one of which must be a language, Greek, Latin, French, German, some other language approved by the board, either mechanics or physics, chemistry, geography (physical, political, and commercial), either natural history (plants and animals) or botany.

Credit is also given for alternative papers of a higher standard which are taken according to specified conditions.

The degree courses extend over three years from matriculation, and lead to the degree of bachelor of technical science (B. So. Tech.).

The subjects of these courses are:

Mechanical engineering.

Electrical engineering.

Sanitary engineering.

Applied chemistry:

(a) General chemical technology'.

(b) Chemistry of textiles (bleaching, dyeing, printing, and finishing).

(c) Paper manufacture.

(d) Metallurgy and assaying.

(e) Chemical technology of brewing.

(f) Electrochemistry

Textile industries.

Architecture.

Printing and photographic technology. In the conduct of the degree courses, great importance is attached to the practical exercises. In the case of mechanical engineering, which is taken as typical, the relative proportion of time assigned to theoretical and practical instruction is shown in the following table and diagram:

04 January 1917 : S.E 5 prototype (A. 4562) flown to Farnborough from St. Omer with various incorporated modifications made during field trials with 60 Sqn RFC (Neuports) by Lt. Roderic M. Hill and Lt. F.H.B. Selous.

28 January 1917 : Maj. Frank Godden (designer of the SE5) departs Farnborough in A4562.

8 minutes later the aircraft suffers a structural failure at 1000 ft. Godden is killed.

A4562 had accumulated only 20 hrs of flight time.

"Eye witnesses" reported that the aircraft was looping when "the inter-plane struts fell from one side of the aircraft".

The Board of Inquiry set up by the R.a.f determined

1. "the propeller had failed" and that

2. "the resulting out of balance forces caused the wings to collapse".

Their final verdict? Godden's death was an "accident".

Capt. A.P Thurston (Directorate of Military aeronautics - Dept. of Design, safety standards) in charge of "technical Direction, RFC" ordered the wreckage of A4562 placed under guard at the crash site for investigation and the area searched for recovery of all pieces of the aircraft. Eventually, the pieces of the propeller are found and put back together.

## Notes on "Civil Aviation"

From his examination of the wreckage, Thurston:

1. determines that the failure of the wing was not due to the propeller.
2. identifies that a spar in one of the lower wings had failed during the application of downward torsion due to a reversal of the "Normal loads" experienced by the wing during flight.

A reversal of the "Normal loads" on the wing happens during inverted flight. However, the design of the wing of the prototype S.E 5 *should have* precluded this, *unless something else had come loose inside the wing prior to the failure of the spar*. Thurston then inspects the second S.E.5 prototype, which had accumulated only 9 hrs airtime. His inspection, by giving the bottom wing "a good bang", revealed that the drag and anti-drag braces were slack and upon cutting the fabric free of the wing, he found that the "Strengthened" compression ribs were cracked.

During inverted flight the resulting load applied to the wings caused the "Strengthened" compression ribs to distort under torsion - allowing the pins holding the inter-plane struts to the spars to fall out.. The "Strengthened Ribs" design was like a "like a box without a bottom". The solution Thurston applied was simple: Join each of the 2 pairs of "Strengthened Ribs" together with an upper and lower skin of 3-ply from the fwd to the rear spar to make the box whole and take the torsion load. <sup>86</sup>

The Directorate of Military aeronautics - Dept. of Design - safety standards has been accomplishing static destructive testing of every aeroplane "Type" that the RFC has selected for "Operational Use".

Reports from every Committee of Enquiry into aircraft accidents pertaining to mechanical failures have been meticulously studied.

Thurston finds that the conclusions of the Board of Inquiry Committees are frequently not justified - owing to "Technical mis-apprehension" (Board of Inquiry Committees are frequently comprised of pilots, not thoroughly trained and qualified Engineers) <sup>87</sup>

1917 : UK : Construction commenced on new Aircraft Repair Depots (ARDs) sites that were established close to an existing railway network and from this extensive railway sidings were created serving large salvage and storage sheds.

15 July 1917 : Flight Sub Lieutenant Frank Bray of the Royal Naval Air Service, 8 (Naval) Squadron who lost his life 100 years ago today **aged 18**. He was the son of Marion I. Bray, of Hambleton House, Roundhay Park Lane, Moortown, Leeds, and the late John William Bray. He went missing in France and is commemorated on the Arras Flying Services Memorial

December 1917 : The RFC has 18,000 "Air Officers"

26 January 1917 : Canadian Aeroplanes Limited starts building factory on six acres, Dufferin Street, in Toronto's west-end industrial district. Curtiss JN-4, manufactured by Canadian Aeroplanes Ltd of Toronto, holds a special place in Canadian aviation history. It was put in large scale production for use in the training program newly established by the Royal Flying Corps (Canada) in 1917. The Canuck was a modified version of the American Curtiss JN-3.

26 January 1917 : The Aeroplane Weekly : The "Canadian Gazette" London (England, not London, Ont.) "Lieut. -Col. Hoare, an Imperial officer, is leaving for Canada to assume the post of Commandant of the new Imperial Flying School now about to be established there.

The British Treasury have sanctioned the establishment of 20 reserve squadrons in the Dominion.

Lieut.- Col, Rees was to be in command, but He is unwell.

Capt. Innes-Kerr, who is now in Canada, will be second in command, and 11 other officers of flying and constructional experience are being sent forward in the near future.

There will also, of course, be scope as officers for Canadians who have shown their capacity in the same sphere of work. "The establishment in Canada of this Imperial school cannot fail to give a great stimulus to aviation in the Dominion, and may well lead to the establishment of an important Canadian industry.

---

<sup>86</sup> Harald Penrose, British Aviation - The Great War and Armistice 1915 - 1919, Putnam & Co., London 1969. pg. 204 SBN 370-00128-1

<sup>87</sup> Harald Penrose, British Aviation - The Great War and Armistice 1915 - 1919, Putnam & Co., London 1969. pg. 204 SBN 370-00128-1

## Notes on "Civil Aviation"

Young Canadians have in the present war shown just those capacities and qualities of daring which make the successful flying man. Sir David Henderson, the head and genius of the R.F.C., has testified to the excellence of the work of the Canadians in that Corps ; they are, he declares, 'in every way a credit to the Dominion' and official records have borne similar witness from time to time. There is a large number of Canadians in the R.F.C. Canadians are also to be found in the R.N.A.S., and many of those known as British officers in both Services are of Canadian birth.

"Upon the development of this popular Service much of our future success on the Western and other fronts most certainly depends, and by instituting this Imperial Flying School in Canada the British Government gives a new encouragement to Canadian enlistment.

The greatest advantage is anticipated from training in Canada, where the atmospheric conditions are well suited to the first stages of learning, and where, of course, there is illimitable space for developments which are less attainable in the more crowded centres of this country. The final stages of training will, of necessity, be reserved for this side of the Atlantic."

January 1917 : England : The Aircraft SUPPLIES co. Ltd. ("A.S.C.O." STANDARD PARTS) publishes AN IMPORTANT WORK OF REFERENCE FOR THE AIRCRAFT INDUSTRY AND THE AIR SERVICES.

120 PAGES. OVER 230 ILLUSTRATIONS. THE SPECIAL LIST OF STANDARD A.G.S. PARTS being R.A.F. Aeroplane General sundries Compiled from Royal Aircraft Factory drawings by Bernard Isaac, is now ready and includes all the most important items. Each part is ILLUSTRATED by reproductions of actual PHOTOGRAPHS and blueprint DRAWINGS.

SPECIFICATIONS, FITS and LIMITS, complete DIMENSIONS and R.A.F. MATERIAL specifications of all mark numbers are also given.

No more applications for copies of the A.G.S. Book can be dealt with at present, EXCEPT from Aircraft Manufacturers, Commanding Officers, and Chief Stores Officers at Service Aerodromes, as the whole of the first edition has now been applied for and reserved.

An announcement regarding a further edition will be made shortly.

Their stated POLICY is the STANDARDISATION OF AIRCRAFT SUPPLIES and PARTS to ensure the SPEEDING-UP of the production of Aircraft for War purposes.

### ASCO DEPARTMENTS:

- i. A G.S. STANDARD PARTS for Air-craft of R.A.F. or Private Design. We hold large stocks and can give quick deliveries.
- ii. R a.f. PARTS for Royal Aircraft Factory designs. We can supply every part and have complete quotations ready for every part on all units. Contractors for "Spares" should consult us.
- iii. Admiralty (RNAS) — We supply all parts for Aircraft to Admiralty specifications.
- iv. METRIC. —Metric Strainers, Bolts and Nuts, etc.

## Notes on "Civil Aviation"

- v. PARTS FOR AIRCRAFT OF PRIVATE DESIGN. We can quote for quick delivery of Parts to Sub-Contractors of Farman, Sopwith, Short, Avros, etc.
- vi. "ASCO" STANDARD PARTS.— We shall shortly be issuing particulars of these arts which are suitable for use on aircraft of all types.
- vii. PRESSINGS & DROP FORGINGS for all parts,
- viii. TURNING: and other lathe work,
- ix. MILLING: etc.—in our own works.
- x. WOOD PARTS: Ribs, Spars, Skids, etc.
- xi. MATERIALS: Fabric and Tapes, Dopes, Timber — (Ash, Spruce, Mahogany, 3-ply, etc.), Wire and Cable Steel (Sheet, Bar and Tube), Aluminiums, Glue, Paints and Varnishes, etc., etc.
- xii. FITTINGS: Propellers, Seats, Wheels, Tyres and Tubes. Controls, Petrol and Oil Tanks, Switches, Taps, Copper Tube and Connections, etc.
- xiii. ENGINE FITTINGS: Washers, Ball Bearings, Magnetos and Magneto Parts, Accumulators, Sparking Plugs.
- xiv. EQUIPMENT: Instruments and Indicators, Safety Belts, etc., etc.
- xv. COMPLETE UNITS: We are now in a position to undertake contracts for complete units (for all type of Aircraft), including Landing Chassis. Pulleys, Main Planes, Tail Planes, Rudders and Elevators.
- xvi. COLLAPSIBLE HANGARS: Timber and Metal Fittings for Bessoneau and other types.
- xvii. FACTORY AND WORKS EQUIPMENT: we are shortly opening a department to deal with the supply of Machine Tools (Metal and Wood), Electric Motors and Fans. Tools of all descriptions. Steel Stock Bins, etc.

### CONTENTS.

1. Chart of A.G.S. covering extracts from blueprints
2. Chart of R.a.f wires covering extracts from blueprints
3. Chart of Tie Rods and Joints covering extracts from blueprints
4. Chart of Nuts, Bolts, etc. covering extracts from blueprints
5. Metric Equivalent Charts
6. Numerical List of A.G.S. Part.
7. Alphabetical List of A.G.S. Parts
8. A.G.S and other Screw Thread Systems
9. A. G. S. Standards for Bolt Heads and Nuts
10. Photographs, Drawings and Dimensions of all important AGS Parts
11. A.G.S. Fits and Limits
12. R.a.f. Material Specifications
13. Test Pieces
14. Articles on "Standardisation" of Aircraft Parts 'and "Accelerating Aircraft Output"
15. Chart of Admiralty Strainers
16. Illustrations of R.A.F. and other Aircraft Parts, &c., &c , &c.

### WE ARE BUILDING UP A REPUTATION !

The History of The Aircraft Supplies Company is a record of progress, initiative and organisation. We are out to help the Aircraft Industry to " increase output "during the war and afterwards to assist in making the design and production of Aircraft a sound commercial proposition. Recognised by the Society of British Aircraft Constructors (S.B.A.C.)

17 JOHN STREET, Theobalds Rd., London, W.C.

West End Office: :: 166 :: Piccadilly, W (Tel: Gerrard 6040)

Mr. Bernard Isaac, Director. G. H. MANSFIELD, Managing Director.

### IMPORTANT NOTICE.

THIS book must not leave the possession of the firm or persons to whom it is issued. The contents are STRICTLY CONFIDENTIAL. COPIES can ONLY be supplied to APPROVED APPLICATIONS from the Air Services and the Aircraft Industry. Persons connected with the Aircraft Industry should make application through their firm. Applications from the Air Services should be made through the Commanding Officer. ONE Copy is supplied FREE, and additional copies may be obtained at 2/6 rack, the whole of the proceeds being given, without deduction, to the Royal Aero Club Flying Services Fund. Applications must be made on the special form, which may be had from the Secretary, The Aircraft Supplies Company, Ltd., West End Offices, 166, Piccadilly, London, W. Application forms have been sent this week to a 1 who have already written for copies. AN Illustrated Leaflet, giving Specimen Pages, Contents, etc., may be had on application. "—pHE A.G.S. BOOK "is not a Trade Catalogue, although it draws attention to the facilities offered by the Aircraft Supplies Company, Ltd., for the supply of all A.G.S. Standard and other Aircraft Parts. It is published as a practical contribution to, and in support of, a proposal of Standardisation as a means of increasing the output of aircraft for war purposes.

# THE "A.G.S." BOOK.

100 PAGES  
AND OVER  
150 ILLUSTRATIONS

IN THE  
PRESS

**THE SPECIAL LIST OF STANDARD A.G.S. PARTS (R.A.F. Aeroplanes General Sundries), compiled by Bernard Isaac, is now in the Press, and will be published shortly. This will contain about 100 pages, over 150 illustrations, and will include all the most important items. Each part will be ILLUSTRATED by reproductions of actual PHOTOGRAPHS and blue print DRAWINGS. SPECIFICATIONS, FITS and LIMITS, complete DIMENSIONS and R.A.F. MATERIAL specifications of all mark numbers will also be given.**

**EXCEPT from Aircraft Manufacturers, Commanding Officers, and Chief Stores Officers at Service Aerodromes, no more applications for copies of the A.G.S. Book can be dealt with at present. The whole of the first edition has now been applied for and reserved. An announcement regarding a further edition will be made shortly.**

**OUR Policy is the STANDARDISATION OF AIRCRAFT SUPPLIES AND PARTS to ensure the "SPEEDING UP" of the production of Aircraft for War purposes.**

8 February 1917 : Kaiser Wilhelm announces unrestricted submarine warfare within specified blockade zones. U.S President Wilson severs diplomatic relations with Germany.

Feb. 10, 1917, the Honourable J.D. Hazen, Minister of the Naval Service, had raised the issue of a possible naval air service for "the adequate defence of the Atlantic coast of Canada." The Cabinet turned it down in March because of costs - See more at: <https://legionmagazine.com/en/2016/02/the-first-air-war-at-sea/#sthash.af5DtQi1.dpuf>.

The general outlines of such defences are later laid down by April 1918; the first air station sites had been selected at Dartmouth and Sydney in Nova Scotia - See more at: <https://legionmagazine.com/en/2016/02/the-first-air-war-at-sea/#sthash.af5DtQi1.dpuf>

17 February 1917 : 3rd voyage French liner S.S Athos enroute Yokohama to Marseille with 1,950 passengers and crew, 543 Chinese labourers headed for the battlefields of France as troops, a large contingent of Senegalese Tirailleurs, civilian passengers including

## Notes on "Civil Aviation"

women and children, mail & general cargo. torpedoed and sunk 200 miles southeast Malta by Capt. Hermann von FischeI : U-65 : Athos sank in 14 minutes taking 754 people, including all 543 Chinese, the captain and 11 crew members to the bottom.

21 February 1917 : The Aeroplane Pg 529 : ANSWERS TO CORRESPONDENTS.

1. **If you want any information about joining the R.F.C.**, write to the Director of Military Aeronautics, Adastral House, Blackfriars, E.C.
2. **If you want any information about joining the R.N.A.S.**, write to the Air Department, The Admiralty, Whitehall, S.W.
3. **Men in the Army, and ratings in the Navy** can only obtain commissions in their own branches or transfers to other branches by permission of their immediate commanding officers, who must forward those applications through the proper official channels.
4. **Applicants for commissions in the R.F.C** enter through the Cadet Wings, and are trained to fly at the Government's expense. This includes Civilians.
5. **Applicants for commissions in the R.N.A.S.** enter as Probationary Flight Officers, and are trained at Government expense. This includes Civilians.
6. **If you are blind or partially blind, or have to wear glasses** for any serious reason, you cannot become a Naval or Military aviator unless you have some very special qualification.
7. **If you have had special technical training**, are over 35 years of age, and attain *the necessary social standard*, which is not high, you may with luck become a Stores Officer R.N.A.S., or an Equipment Officer R.F.C., even if your sight is defective and you are physically deficient in other respects.
8. **Information concerning appointments as viewers or examiners or inspectors** in the Aeronautical Inspections Department (A.I.D.) may be obtained from the Chief Inspector, A.I.D., Adastral House, Blackfriars, E.C.
9. Observation of the points indicated above will save a great deal of unnecessary correspondence at the Admiralty, at Adastral House, and at this office, as there is no need to write letters on any point already explained above. The Editor is always pleased to answer questions or explain any points not understood by readers, but space in The Aeroplane is valuable, and the same question cannot be answered over and over again week after week. Consequently readers are requested to make quite sure that their questions have not been answered a week or so before.
10. To: E.K. (Eastbourne).
  1. Stores Officers, R.N.A.S., are practically the same thing as Equipment Officers of R.F.C. (vide The Aeroplane any time during the last month or two).
  2. Numerous ratings in the R.N.A.S. have received commissioned rank, presumably on the assumption that the man who enlisted in the R.N.A.S. early in the war is of a class somewhat superior to the ordinary Naval rating of the pre-war type. This fact naturally makes it more difficult for permanent service men, who are regular Naval ratings, to obtain commissions, but a man who has enlisted for permanent service in the R.N.A.S. since the war should have no particular difficulty in obtaining a commission if he happens to be on good terms with his immediate commanding officer.
11. To : L.L.G. (S.A.P., B.E.F.)
  1. 1st, 2nd, and 3rd Class Engineering Officers (E.Os.), R.F.C., rank accordingly as Captains, Lieutenants, and Second Lieutenants, and draw R.F.C. pay minus flying pay.
  2. A 3rd Class E.O. draws about 12s. a day.
  3. An officer transferring from the A.S.C. would, of course, draw E.O.'s pay.
  4. There is in the Army some small extra pay for interpreters, but this does not apply to every officer who happens to speak a foreign language. It is necessary to pass an examination in order to 'acquire the said extra pay.
12. To: H.H. (Ashford)
  1. Compressed air engines are rather outside the scope of this paper, but doubtless if you write to the Secretary, the Institution of Mechanical Engineers, Great St. George Street, S.W., he would be able to inform you as to the standard works dealing with this species of power plant.
13. To: D. (Willesden Green)
  1. There is provision in the R.F.C for *Boy Learners* aged from 17 to 19. *They are trained as Air Mechanics*, and, eventually transferred to that rank, *which is the equivalent to private in the Army*.
  2. If your son is old enough, the best thing he can do is to go down to the R.F.C Recruiting Depot at Farnborough and make a personal application.
  3. He will have to be prepared to sign on for 4 years and to stop there on the day of his application if necessary.

## Notes on "Civil Aviation"

4. If you wish your son to receive a commission in the R.F.C he will have to wait until he is 18, when he apply for a cadet-ship in the R.F.C

March 1917 : The United States of America declares war on Germany. Britain and France submit an immediate request for an "air armada" of 20,000 airplanes and 30,000 engines. <sup>88</sup>

14 March 1917 : Due sinking of the S.S Athos, the Chinese government breaks off diplomatic relations with Germany.

Between March and May 1917 : RFC lose 1270 aeroplanes. number of pilots killed outpaces those who replace them.

mid-March 1917 : At the beginning of this month (on the day before Graves's death, to be exact) William Avery "Billy" Bishop joins 60 Sqn. Bishop is the son of a well-known family in Montreal, he had passed through the Royal Military College and had joined the Canadian Cavalry, coming over with his regiment with the first Canadian contingent. applied to join the Flying Corps soon after arriving in blighty., posted as an observer to No. 7 Squadron. After a tour of duty in France as an observer he went home to learn to fly, and was posted to 60 Sqn almost as soon as he had got his wings.

On the occasion in which Bishop got his first Hun:

his engine subsequently failed, forcing him to land very near the front-line trenches. only just succeeding in scraping over the line.. The failure of the engine was due to Bishop's allowing the engine to choke while diving - fouling the plugs.

Having landed in an "unhealthy spot", Bishop got rapidly into a dugout occupied by some field gunners, and, with their help, moved his machine every half- hour to prevent the German artillery shelling it.

During the night Bishop borrowed a toothbrush from the gunner officer, and with this contrived to clean the sparking plugs of his engine. Having heard nothing of him, 60 squadron already having reported him missing, he then succeeded in getting a telephone message through to say that he was safe.

"Only those who know how irritating a thing an aero engine can be when you are in a hurry to start can appreciate the high standard of efficiency attained by RFC mechanics...[..]"

Shortly thereafter Bishop's return, the sergeants gave a musical evening to which the officers were invited, and it was here observed that one of the very few toasts which were proposed by the squadrons' sergeants - quick to recognise Bishop's quality - was that of Bishop's health (although he had only destroyed one enemy machine). None of his fellow-officers had, as yet, any idea of the brilliant career that was in store for him.

The chief

difficulty was that one could not ask pilots and mechanics to work all night as well as all day.

"ack-emma's = RC Pilot slang for A-M's" Air Mechanics (A.M's) — [for winging like old wives no doubt?]

March 1917 : the UK Air Board formed. The AID becomes part of the Ministry of Munitions (supply departments of the Admiralty and War Office are now combined). AID mandated with inspection of all Naval aircraft and engine contracts (previously the Admiralty did it's own aeronautical inspection) as a result, new A.I.D departments were formed:

1. "Seaplanes" a special branch headed by a Chief Inspector
  1. inspection of all Naval aircraft built by / received from contractors
  2. inspection of all Naval engines built by / received from contractors
2. "Acceptance Parks and Depots"
  1. acceptance and testing of aerodromes (airfields)
  2. acceptance and final testing of complete aircraft.

From infancy at the start of the War, the British aircraft industry grew to deliver hundreds of aircraft and thousands of components a month.

---

<sup>88</sup> ENGINEER IN CHARGE - A History of the Langley Aeronautical Laboratory, 1917-1958 by James R. Hansen pg 16 - National Aeronautics and Space Administration, Washington, DC - Scientific and Technical Information Office, 1987

## Notes on "Civil Aviation"

- A. Now impossible for AID to continue a "full inspection" system with their own staff.
- B. AID begins system of "selective inspection".
  - 1. Manufacturer's / supplier's own inspection staff are trained and qualified to view / inspect 100% of the manufacturer's / supplier's product,
  - 2. Only a proportion of the Manufacturer's / supplier's product is re-examined by AID Inspectors.
  - 3. A.I.D Inspectors' visits became advisory sessions - firms new to aviation lean heavily on AID experts for guidance.

01 March 1917 : On March 1st Mr. Forster (Sevenoaks, U.), in the course of speech on the Army estimates, said : —

As far as the Royal Flying Corps is concerned, the supply of personnel, both of officers and men, has been maintained, although

the provision of skilled mechanics in sufficient quantities has presented difficulties which I think have been overcome. The importance of this cannot be overstated, for whilst, of course, troops of all kinds contribute their quota to the success of the whole Army, none do more valuable or more conspicuous work than the Royal Flying Corps in all the theatres of war. (Hear, hear).

We all recognise their intrepid daring and indifference to danger, which is only equalled by the skill with which they carry out their perilous duty and the value of their work both to the army in the field and to the safety of our people at home. (Hear, hear).

The training of officers in flying has been very largely extended.

It may interest the House to know that we are establishing new flying schools in Canada and in Egypt, and I should like to take this opportunity of acknowledging the valuable services of a large number of Colonial pilots in the Flying Corps. (Hear, hear).

There has been some difficulty and delay in obtaining the necessary aircraft, in spite of the assistance which has been given to us by the Ministry of Munitions, but I hope these difficulties have now been overcome.

The formation of the Air Board with extended powers and the entrusting of the practical business of the supply of aircraft both to the Navy and Army to the Ministry of Munitions will, it is hoped, give the Air Services the priority which their importance demands.

The policy of instituting an Air Board has for some time had the firm support of the Army Council, and, although the new arrangement

has been in force only for a week or two, its influence is already having effect. It must be remembered, however, that

whatever the efforts of the Air Board and the Ministry of Munitions, they cannot be expected to show at once a greatly increased output.

Anti-aircraft stations have been installed at various points, and,

though the actual buildings are only a few huts and officers in each case, there is much work involved in connection with the electrical connections and other accessories which is not always a matter of easy arrangement in isolated country districts. I am

not going to boast about what might happen in the event of renewed Zeppelin raids, but we have profited to the full by the experience that we have gained.

[Mr. Forster is to be congratulated on a very moderate and convincing statement of affairs, which contrasts highly favourably with the magniloquence of his predecessors in office. It is pleasing to find a Minister understating rather than overstating the work of his department, and Mr. Forster's future pronouncements on aeronautical affairs will carry the more weight on account of this brief and businesslike reference to the subjects—Ed.]

## Notes on "Civil Aviation"

7 April 1917 : United States declaration of war against Germany

April 1917 : The RFC suffers upwards of 30% attrition in air-crew during "Bloody April" with the introduction of the Fokker DI-III "Albatros".

April 1917 : 60 Sqn RFC - new aeroplanes were collected from Paris. Some of these "new" French built aeroplanes were not well built" and soon suffered from structural failures in the air.

1. Lieut. Grandin's fell to bits while diving on a hostile two-seater [possibly due to damage from machine-gun fire].
2. Caffyn's collapsed when practising firing at ground targets on the aerodrome and he was killed;
3. Brackenbury's collapsed when practising firing at ground targets on the aerodrome.
4. Ross's wings folded upwards when pulling out of a dive after firing a burst, he was badly injured.
5. Penny's left lower plane came off while diving on a Hun.
6. Penny flew the damaged aeroplane to a British aerodrome where he quietly reported to the squadron commander:
7. " My lower plane came off, so I thought I had better land. Sorry I left the patrol, sir."

The identified reason for the failures in the French manufactured aeroplanes was:

1. The use of badly seasoned wood
  2. Considerable weakening of the main spars by inserting dozens of little screws in them during manufacture.
- RFC-H.Q. were informed and the matter was put right.

60 Sqn. RFC Elementary work and maintenance:

Having exhausted their ammunition the pilots came back refilled with petrol and re-armed with 300 rounds then dashed off again to the chemical works without waiting for orders. Repairs to the 200 h.p. Renault engine, a type with which none of

## Notes on "Civil Aviation"

60 sqn mechanics were very familiar, take longer than expected.

Low flying [ground attack] became more popular with the higher command, though not with the pilots, as the war went on.

Ground Attack by the RFC helped to stop the enemy advance on the 5th and 3rd Army fronts during the German offensive of March 1918,

Hostile balloons were constantly attacked during April and May by:

Bishop,  
Ross,  
Molesworth,  
Penny  
Langwill,  
Hall,  
J. Elliott,  
Smart, and

April 2 : F. Bower - pursues [with his patrol] six hostile scouts a long way east of Douai in a very strong westerly wind. Though shot through the stomach during the fight he flew west and landed near Chipilly with his intestines hanging out. His machine is mechanically and structurally undamaged except by bullet holes.

April 3 : F. Bower dies of his wounds. His machine is flown back to the squadron without needing field repairs by another pilot.

After the Armistice when the the Air Force demobilisation began, the particulars of the terms of each officer's engagement were scrutinised.

it was surprising to find how many Americans were serving in English scout squadrons. Out of a total of twenty-five officers in each single seater squadron in France it seemed that at least three or four officers were "American" citizens who had represented themselves to be Canadian citizens in order to join in the war - SIXTY SQUADRON history R.A.F.

Moreover, the majority of these wore at least one medal for gallantry, the reason being, no doubt, that these young men were the very flower of the American fighting stock - SIXTY SQUADRON history R.A.F.

18 April 1917 : "Pacific Aero Products" renamed "The Boeing Airplane Company".

26 April 1917 : FLIGHT : The Army Council and Military Aeronautics. IN an Order in Council, published in the London Gazette of April 24th, setting forth the individual responsibilities of the members of the Army Council, the following appears:— " (f) The Director-General of Military Aeronautics shall be responsible to the Secretary of State for so much of the business relating to the administration of the Army Air Service as is not subject to the control of either the Air Board or the Ministry of Munitions, and as may be assigned to him from time to time by the Secretary of State."

26 April 1917 : FLIGHT : STEELS USED IN AERO WORK : paper on the " Use and Abuse of Steel," presented by Lieut.-Col. R. K. Bagnall-Wild and Lieut. E. W. Birch to the Institution of Automobile Engineers, and the one on " Steels used in Aero Work," read by Dr. W. K. Hatfield before the Aeronautical Society last week, furnish a good deal of valuable information on a subject which is becoming increasingly important.

In the former paper (which is now appearing in " FLIGHT ") the authors discussed many of the difficulties which have been met with in practice, and a study of their conclusions should enable manufacturers to avoid trouble ; while Dr. Hatfield in his paper discussed the subject chiefly from the metallurgical point of view. He emphasised the necessity for engineers responsible for the building of aeroplanes and engines, if they are to obtain anything like the best results from the materials now available,\* to study the characteristics and properties of those steels. They should understand the reason for the various heat treatments, and should appreciate the considerations which lead to the selection of any particular one as the means of placing the -steel in the final condition in which it may be expected to do the best service. There were two essentials in steel for aero work—(1) the use of high-class material, and (2) scientific methods in works practice.

Discussing the question of factor of strength, Dr. Hatfield said that, although it had been pointed out on many occasions that the use of the term " factor of safety " was misleading „ yet the erroneous use of the term still continued. It appeared

## Notes on "Civil Aviation"

to him that a true "factor of safety" should be the ratio between the stress which may be safely applied indefinitely under the actual working conditions to the stress actually employed, and not the ratio of ultimate stress of the material under a static test to stress thought to exist in practice, as calculated from imperfect data combined with many doubtful assumptions. This latter ratio, whilst very useful in formulating empirical rules, should really come under a very different name, such as, for instance, "factor of contingency," already proposed by Mr. Lanchester. The actual values of this factor, employed in modern design, have been arrived at largely by the method of trial.

Dr. Hatfield suggested that better results might be obtained, and fewer mysterious failures result, if the various contingencies to be allowed for were carefully examined and the "factor" placed on a more definite basis.

Dr. Hatfield also suggested that the several parts which had to be dealt with in aero work are really sufficiently small to permit conveniently of numerous quantitative destruction tests, and if more of these were made the engineer would be better able, in a practical manner, to obtain definite data upon which further progress in design might reasonably be expected.

26 April 1917 : FLIGHT : 'The Properties of Aerofoils and Aerodynamic Bodies.'

UNDER this title Mr. A. W. Judge has written a volume, which forms a companion to his "The Design of Aeroplanes," but which is, nevertheless, complete in itself to the extent indicated by its title. The merits of Mr. Judge's latest volume do not so much lie in any great originality or addition to present-day knowledge, as in the fact that he has collected and arranged in convenient form all the more important data already available on the subject of wing sections, bodies and struts. Extensive use has been made of the results published by the Advisory Committee for Aeronautics, and by Mons. G. Eiffel. Although these works are, of course, well known to those who have made a long study of aeronautics, there can be little doubt the rapidly increasing number of more recent students are not so familiar with them, and have in many instances found some difficulty in collating the various experiments, due chiefly to the different units employed in recording the results. Also, Eiffel's latest books have not yet been translated into English, a fact which, added to the difficulties of following with the desired closeness the expressions in metric units, may have prevented many students from making full use of the wealth of information contained in these excellent works. It is to these that Mr. Judge's latest book will especially appeal, as the author has converted Eiffel's results into the "absolute" coefficients employed by the National Physical Laboratory, thus making comparison of results obtained at the two institutions considerably simpler. A point which should help to recommend the book to those just taking up the study of aeronautics is that the mathematical side of the subject, although the theory of the cambered plane and the principle of aerodynamic similarity have been touched upon, has been kept very brief, and is so simply treated that anyone with a reasonably good education will have no difficulty in following it. The book, which is published by Whittaker and Co., is obtainable from the Offices, of "FLIGHT." The price is 15s. 6d. post free.

26 April 1917 : FLIGHT : A Roosevelt for the Flying Service. A REPORT from Ottawa states that Quentin Roosevelt, son of the ex-President of the United States, will take the aviation course at Camp Borden, and qualify for overseas service with the Canadian Flying Corps or with the American Expeditionary Force, if the latter is sent.

1917 : German submarines are reported to operate off Canada's East Coast.

May 1917 : Prime Minister Sir Robert Borden raises the issue of a distinct Canadian air arm. about a fifth of the RFC was Canadian. While visiting overseas, Borden appears to have heard some grumbling by Canadians about discrimination, lack of

## Notes on "Civil Aviation"

promotion and lack of formal recognition - See more at: <https://legionmagazine.com/en/2015/06/canadian-flyers-go-to-war/#sthash.Nujh0vay.dpuf>- See more at: <https://legionmagazine.com/en/2015/06/canadian-flyers-go-to-war/#sthash.Nujh0vay.dpuf>

Canadian air force personnel flew with British units. Discipline of British air units was governed by the United Kingdom Air Force (Constitution) Act 1917.

The Air Force (Constitution) Act, 1917, (U.K.) 7 & 8 Geo. V, c. 51 forms the Second Schedule to the Air Force (Constitution) Act, 1917.) which includes the Air Force Act.

The United Kingdom Air Force (Constitution) Act of 1917 is a copy of the Army Act - replaces word for word the "Army" with "Air Force" .

Since 1917 military law applicable to British Air Forces has remained virtually identical to the law governing the British Army.

Canadian personnel enlist and fly with British units.

Discipline of British air units is governed by the United Kingdom Air Force (Constitution) Act of 1917.

(McDonald, "The Trail of Discipline: The Historical Roots of Canadian Military Law" at 19.)

May 1917 : United States War Department selects the British designed DeHavilland 4 as the multipurpose battle plane it would build under license; however, a commission headed by Col. Raynauld C. Bolling and Capt. Virginius E. Clark, sent to Paris by the secretary of war to consult with the Allies' aviation experts, determined that not only was the DH-4's standard engine underpowered for the airplane to perform as well as the U.S. Army wanted it to do, but that so too were all other existing American and European engines. The Bolling-Clark group identified the need for development of a new engine for the DH in June 1917, precisely the time that an initial layout plan for Langley Field was being finished by Albert Kahn's architectural firm of Detroit. Within the month, an engineering design of the new "Liberty" engine was ready By 17 July 1917 Henry Ford and the Packard Motor Company had a prototype Liberty engine running.

### 30 May 1917 : THE UK CIVIL AERIAL TRANSPORT

- COMMITTEE: Lord Northcliffe (Chairman).—Proprietor of the "Times," "Daily Mail," and numerous other publications.

Was the first newspaper proprietor to grasp the possibilities of aviation, and has given large sums in prizes in the endeavour to advertise flying among the British Public. During the war he has used his newspapers to support the various agitations for adequate aircraft equipment, and has thus been of material assistance to the Flying Services.

Major Baird, M.P. (Deputy Chairman) .—Recently nominated to reply for the Air Board to criticisms in the House of Commons. Is not known to have been interested in aviation previously, but has endeavoured to inform himself on the subject in the short time available.

Is said to have qualified for his Aviator's Certificate, and has done a good deal of cross-country flying as a passenger. Has, apparently, implicit faith in Official Designers, and has still a great deal to learn about flying, both historically and technically.

The Duke of Athole.—Chairman of the Royal Aero Club. As Marquess of Tullibardine was interested in the early experiments with the inherently stable Dunne » aeroplane at Blair Atholl, and was the chief financial support of the Blair Atholl Aeroplane Syndicate, which was formed to develop the knowledge of inherent stability long before the existence of that quality was discovered by Government officials. Has been a highly valued supporter of aviation in general for many years, and has flown as a passenger, but one can hardly support the statement in the "Times" that "he has had actual experience as an airman."

## Notes on "Civil Aviation"

Coeonel Lord Montagu.—One of the earliest supporters of aviation in this country, and possesses foresight concerning the development of aviation amounting almost to the gift of prophecy, as shown by his speeches in the House of Lords so far back as 1909. Rendered highly valuable service to the Empire during the agitations for adequate aerial forces early in 1916, by his outspoken and well-informed criticism, and especially by his resignation, from the "Derby Committee" as a protest against its impotence. As a Peer of the Realm his criticism impressed on the British Public the fact that similar criticisms by mere commoners were not mere vulgar agitation. Does not profess to be a practical aviator, not being a pilot, so the "Times" scarcely seems correct in describing him as "one of the leading experts on questions of airmanship."

Lord Sydenham, G.C.S.I.—As Sir George Sydenham Clarke earned the reputation of being one of the most distinguished soldiers and administrators of the Empire. A firm believer in the possibilities of aircraft, and as one of the leading authorities on Military Science as well as on Colonial Administration is particularly worthy of trust and consultation where the employment of aircraft by Governments is concerned. Is a man of high principles, and has the courage of his convictions, as was shown by his resignation from the previous Air Board as a protest against its lack of executive power. Should have occupied an important position in the present Air Board.

Mr. Baefour Browne, K.C.—A distinguished lawyer, an authority on patents, an amiable gentleman, and a member of the Government Enquiry Committee which in 1916 endorsed so many criticisms of the Administration of the Royal Flying Corps.

Mr. A. E. Berriman.—Formerly an aeronautical and motor journalist and writer. A clever mathematician. At present technical adviser on aeroplane and aeroengine construction to the Daimler Motor Car Company of Coventry.

Mr. G. B. Cockburn.—One of the pioneers of British Aviation. Was the only British competitor at the great aviation meeting at Reims in 1909, where he flew the first Farman biplane ever built. Continued thereafter

to experiment at his OWN expense on Salisbury Plain. In 1911 devoted some six months of his time, entirely at his OWN cost, to teaching flying to the first four officers permitted, to fly officially by the Admiralty on Short biplanes lent free of charge by Mr. Frank McClean. [Note.—So far as can be gathered, neither Mr. Cockburn nor Mr. McClean ever received even so much as a letter of thanks from their Lordships of the Admiralty for their patriotic generosity.]

Later, when the Aeronautical Inspection Department R.F.C. was formed under the late Lieut. -Col. Fulton, C.B., his close friend, Mr. Cockburn, at his urgent request, joined him as inspector of aeroplanes, and in the onerous duties he has continued to carry out ever since with marked ability and moral courage. On every aspect of aviation Mr. Cockburn's views are of the highest value, and his appointment to this committee

is a singularly happy selection.

Mr. G. Hon' Thomas.—With the exception, perhaps, of the late Sir George White, was the only business man to have faith in the commercial future of aircraft in the earliest days. Did much to impress this country with the possibilities of flying by introducing the best French engines and aeroplanes and pilots. Set up the beginnings of his present vast concern, the Aircraft Mfg. Co., Ltd., at a time when every official' discouragement was, given to British pioneers.

Is now head of the biggest aircraft and aero-engine combination in the world, as the result of his foresight. Possesses unlimited faith in the future of aerial transport, and possesses the mental capacity and organising ability to make his faith a business asset.

Mr. Claude Johnson.—Managing Director of the Rolls-Royce Motor Car Company, who have recently produced a highly successful aero-engine as the result of that Government encouragement which purely aeroengine firms lacked before the war.

Mr. Joynson-Hicks, M.P.—Member of Brentford Division of Middlesex. Ha's been for years a strenuous critic of Governmental apathy towards the Flying Services. In 1913 and early 1914 twice convicted the War Office of lying about the number of aeroplanes available for the Royal Flying Corps. Consistently attacked Lt.-Col. Seely, when Minister for War, on aerial\* affairs. Supported energetically the 1915 and 1916 agitations for adequate equipment of the Flying. Services, and has rendered valuable service in these matters.

Professor F. W. Lanchester.—Designer of the original Lanchester motor-car. Is, or at any rate was recently, connected in a technical capacity with the Daimler motor-car firm. Has contributed copiously to aeronautical journalism, and has lectured largely on the subject of the excellence of Government aeroplanes. Has addressed political voters in the Government interests against the doctrines ' of aeronautical reformers.

Is known to have designed an aero-engine which did not function, and an aeroplane which did not fly, but is not publicly known to have designed either form of mechanism with success. Is a prominent member of the Government Advisory Committee for Aeronautics. Lieutenant-Colonel Mervyn O'Gorman, C.B.

---

Formerly «a consulting engineer concerned with the electrical profession and the motor-car' trade. In 1909 became, during half his time per week, Superintendent of the Army Aircraft Factory at Farnborough, which later became the Royal Aircraft Factory. After the outbreak of war took up full-time employment at that establishment, and was appointed Lieut. -Col. (T.F. temp.), on the Formation of a Territorial Unit R.F.C. known as Hampshire Aircraft Parks—from among the employees , of the R.A.F. After the agitations of 1916 and the investigation of the R.A.F. organisation by the " Burbidge Committee," :was transferred to Adastral House as technical adviser to Lieut. -General Sir David

## Notes on "Civil Aviation"

Henderson, Director-General of Military Aeronautics. -

Major-General Ruck, C.B.— An able soldier and organiser. Chairman of the Aeronautical Society of Great Britain—Which should be most carefully , distinguished

from the Aeronautical Institute, a name which is apt to be confused with it.

Under his chairmanship the Society'- has acquired a new lease of life, and is doing most valuable work.

Mr. J. D. Siddeley.—Managing Director of the Siddeley-Deasy motor-car firm. Formerly of the Rover Cy'de Company, and later of the Wolseley Motor Company. Has recently become concerned with the production of aero-engines.

Mr. T. O . M. Sopwith.—A pioneer of British Aviation, and. in his day one of our most skilful pilots. Won. the De Forest ,£4,000 prize in 1911 for the longest flight . out of Great Britain on an all-British machine, using a ' Howard Wright biplane .and an E.N.V. engine. Later flew in America. On his return began to build aeroplanes, and consistently beat all performances by official , productions. Revolutionised, ideas of design by pro- - ducing the famous "tabloid" single-seater, and has" since at frequent intervals produced war aeroplanes far j

surpassing contemporary enemy designs,, only to have his own designs adopted in quantities months later\*

-

when the enemy had almost reached the same level. '

Has been equally brilliant as a pilot, an originator of design, a producer in quantities, and as a business man.

Possesses extraordinarily mature judgment in combination with youthfulness of idea.

Mr. H. G. WELLS.—Described by the "Times" as.

"novelist and man of. science, whose 'War of the , Worlds ' was almost prophetic with reference to many aerial developments of to-day." Apart from the fact that the "War of the Worlds " dealt with the visit 'of supposititious Martians fo this world and that the title is evidently a' mistake for " The War in the Air," the-- description seems unfitting. LTnless one includes the study of the manners and customs of drapers' assistants among the sciences, one fails to see Mr. Wells' claim to be a man of science. Most of his scientific allusions seem to be based on a smattering of the kind which mne might acquire from a cheap encyclopaedia. The late lamented Jules Verne wasHar more scientific and far more prophetic, if less successful in depicting the sordidity of the lower middle classes.'

Mr. Wells' chief claim to fame seems to be as a sociologist—of a somewhat , entomological kind—and more recently his sociolog}' seems to have tfended Towards republicanism. One fails utterly to see any reason whatever for his inclusion on this Committee.

Mr. H. White-Smith.—Secretary and a Director of.

.

the British and Colonial Aeroplane Co., Ltd., the first

great business to be founded exclusively for the production of aircraft. Was concerned in the foundation of his firm in conjunction with his uncle, the late Sir George White, Bart. Is Chairman of the Society of British Aircraft Constructors. A business man—with an exceptionally fine training, a pioneer of aircraft construction, a man of sound judgment and of foresight, with the ability to set forth the views of aircraft constructors in a moderate manner such as cannot offend the most hardened official, his appointment is one which will be welcomed by all.

Mr. W. Tyson Wilson, M.P.—Labour member for West Houghton (Lancs). Said by the "Times" to be one of the founders of the Bolton Building Trades Federation. Has recently asked in the House a few questions on aircraft of a kind which made one imagine that they were designed to help Ministers to get out statements to the advantage of the Government. Otherwise has no concern with aircraft, unless one argues that the Building Trade is as much entitled to representation as is the Motor Trade, especially in view of possible contact between commercial aeroplanes and suburban villas after the war.

Sir Laurence Guillemard, K. C.B.—Representing the Treasury and Board of Customs. Stated by the "Times" to have been Chairman of the Board of Customs since 1908—

w

will doubtless pay special attention to aerial smuggling.

Colonel J. W. Pringle, R.E.—Representing the Board of Trade. One believes that this officer has been largely concerned with the investigation of railway collisions. The appointment therefore seems eminently

|

sound in view of future possibilities of aerial transport.

The Earl of Drogheda.—Representing the Foreign Office. Has long been intensely interested in aeroplanes, and has the best possible information on the

!

latest developments constantly available to him. He possesses keen judgment, and is personally immensely popular with all who meet him either officially or unofficially, so that in our international dealings in aircraft affairs after the war, as well as in our preparations at present, he should be a most valuable member of the Committee.

Mr. G. E. A. Grindle, C.M.G.—Representing the Colonial Office. One has to confess complete and lamentable ignorance of the qualifications of this doubtless estimable official.

Mr. G. E. P. Murray, C.B.—Secretary of the Post Office, representing the Postmaster-General. Another excellent appointment.

The India Office will be represented by Lord Montagu, who will doubtless do it justice, but one would have preferred to see Lord Montagu's imagination freed from all local ties, and to have seen some experienced Indian official appointed specially for India's benefit.

## Notes on "Civil Aviation"

- Sir Thomas Mackenzie, High Commissioner for New Zealand, and the Rx. Hon. W. -P. Schreiner, High Commissioner for South Africa, will represent their respective nation's interests, but one would like to see natives of those countries who have had aviation experience taken into consultation. For instance, Captain J. J. Hammond, R.F.C., could doubtless say much about the possibilities of New Zealand. Lieut. John Weston, R.N.V.R., a Burgher of the Free State, who has flown ever since 1910, who is one of the very few men who hold certificates as pilots of aeroplanes, airships, and balloons, and who has built and repaired his own aeroplanes and engines in South Africa, should be of high value to the Committee.

It is hoped that Canada and Australia will also nominate representatives. One hopes they will nominate some able man who knows something of practical aviation, and will not be content with purely political [ appointments.

Captain Vyvyan has been nominated by the Fifth Sea Lord of the Admiralty to represent the R.N.A.S., which otherwise seems poorly represented when compared with R.F.C. interests.

Brigadier-General Brancker will represent the R.F.C., an obvious and wholly praiseworthy appointment. As one who has never failed to express his faith in the future of flying, as an experienced pilot, as an able soldier, as a man of ideas, and as an administrator and organiser, General Brancker's appointment can only be productive of good results.

The Meteorological Office has also been asked to name a representative. One hopes that his ideas on aviation will be less foggy than those of the members of that distinguished office who have hitherto delivered themselves in public on the subject.

Mr. D. O. Malcolm, whose connection with aviation

, is not made public, is announced as the Secretary of the Committee, whose offices will be at Winchester House, St. James's Square, S.W.

Purely Unofficial.

It was stated officially that one or two additional names will be subsequently announced, and one hopes that these choices will be wisely made.

One notable omission so far is the name of anyone concerned with purely marine work, such as is entailed

in big flying-boat problems. As the only officer in the R.N.A.S. whom Dr. MacNamara was able to mention in the House recently as having produced a seaplane fit for service, Commander John Porte's name seems a necessary addition. Commander Porte was one of our earliest and best pilots, he has had plenty of business experience, and he has been proved to be a capable and far-sighted constructor. The pre-war Transatlantic Wanamaker-Curtiss-Porte boat has more than justified its existence<sup>1</sup>

, and it is the obvious machine for river transport of the future.

Commander Porte knows more about the problems of

## Notes on "Civil Aviation"

producing big flying boats than does any living man, but as he is now altogether in the Service there should be a civilian representative of the same interests, and here the choice seems to fall obviously on Mr. S. E. Saunders, of Cowes, who built the hulls for the first Sopwith "Bat-boats," which were so brilliantly successful, and has built many others since. Essentially a "marine engineer," Mr. Saunders should be a most valuable acquisition to the Committee.

Another notable omission is that of all "lighter-than-air" representatives. Personally one feels that at first many people would rather journey aurally by airship than by aeroplane, and that airship lines to Paris may for long compete with aeroplanes. The evident representative of the "lighter-than-air" branch, from a Service point of view, should be Colonel Maitland, whose quiet and convincing method of discussion, whose vast experience, and whose sound judgment should be of very great value. Also, in view of the fact that he was the only civilian airship constructor and pilot to achieve results, and as the great pioneer of British airships, Mr. E. T. Willows, should certainly be called upon for his mature knowledge.

There are other omissions, some even more surprising than some of the inclusions, and certain of these are as surprising as anything that has happened in the war. For instance, one is surprised that Mr. Butcher and Mr. Charles Bright were omitted, after the notably good work which they did on the Air Enquiry Committee as exemplified by the Committee's Report.

But probably enough has been said for the moment, till we see how the Committee shapes when it gets to work. There are sufficient able and honest men on the Committee to prevent it from ever being a real danger to the community, or even to the future of flying, and one hopes that they will so guide the whole mass that, whatever powers may ultimately be conferred upon it may be used to make up to some extent the loss of progress which has been caused by officialdom in the past.

—C. G. G

June 1917 : Aircraft Production Board established in America. Bolling Mission sails for Europe to gain information for an American aircraft programme.

June 1917 : 958 English companies are engaged on the manufacture of aeroplanes. 301 of these are direct contractors to the Crown, and 657 are sub-contractors" American journal "Flying".

June 1917 : General Sir Sefton Brancker, Deputy Director General of Military Aeronautics, submitted proposals to centralise the technical training of men, women and boys in a new school to be located at Halton, Buckinghamshire.

16 June 1917: The first contingent of American aviation engineers (93 civilians) sail to England to study British and French aircraft manufacture.

20 June 1917: Aeroplane weekly. "

d ielegrapn enffmeers, of Woodland Works, Chad- well Heath. He was a member of tlft Institute of Electrical Engineers.

About the tinjie of the outbreak of war h4 returned rom Canada, where he had been engaged on important electrical undertakings, and at once offered himself for service - the R FC refUSED ft

a commission on medical grounds, but joined R-F.C as a first-class air mechanic. Within a few momhs he received his commission and pilot's certificate, and shortly After- wards went to the front. There he remained for about twelve months, during which time he was recommended for the Military Cross, which he eventually received at the hands of the King at Buckingham Palace on February 14th last. Early this yea? he was recalled, having been selected to give instruction in'the manoeuvring of the latest types of aircraft, and it was while dutles that he was killed.

## Notes on "Civil Aviation"

25 June 1917 : AT the inquest on Lieut. Jacob at Birmingham on June 25th, nfer Birmingham, a statement by Lieut. Villiers, who was injured and is in hospital, was read. He said that after climbing to 3,500 ft. they looped once, and -were preparing to loop again when he found the controls were jammed. The machine side-slippec and fell 2,800 ft. He tried to break the fall by pulling into two trees, but failed.

25 June 1917 : : A verdict of " Accidental Death " was returned at an inquest at Plymouth re the death of Flight Sub-Lieut. H. L. Cowe, R.N.A.S., fatally injured when his seaplane nose dived from a height of 1,000 ft.

26 June 1917 : : A verdict of " Accidental Death" was returned at an inquest at Hounslow re the deaths of Capt. H. B. Hamber, R.F.C., and Air-Mech. Stanesau. through their aeroplane nose-diving into a field at Harlington. Air-Mech. Stanesau was killed outright, Capt. Hamber later died from his injuries. It was shown in evidence that Capt. Hamber went with Air-Mech. Stanesau to the assistance of another pilot who had come down. After seeing him safely off, Capt. Hamber and Air-Mech. Stanesau reascended. Capt. Hamber's machine was observed to turn sharply, fall for some distance, resume a level course, and finally crash to the earth from a height of between 300 and 400 ft. Major Chadwick, R.F.C., stated that the Accidents Committee had held an official enquiry, but could advance no theory as to the cause of the crash.

25 June 1917 : 2nd Lieut. J. H. E. Barron, 42, of the Royal Flying Corps, was flying a biplane at Hendon when it fell about 50 ft. The machine was smashed and the officer killed. The accident was attributed to the officer trying to turn the machine as he was rising.

25 June 1917 : Capt. G. W. T. Lindsay, R.A., and 1st Air-Mech. C. E. Sharman were killed instantly when their aeroplane fell from a considerable height in a field near Bristol, UK.

26 July 1916 : The Aeroplane Weekly records the issue of the first annual report of the United States National Advisory Committee for Aeronautics.

18 August 1917 : Air Mechanic Ingledew signs an affidavit that he was crew aboard H.M. Seaplane 9860, under the command of Flight Sub-Lieutenant Charles Mossop, on patrol 27 miles north of Cape Barfleur, sights, attacks and sinks what is believed to be German submarine UB-32, there were no survivors of the 35 officers and men on board. Lieutenant Mossop was later killed on active service on August 12, 1918, and Mr. Ingledew was the sole survivor of the engagement with the submarine serving as an air mechanic and as a flight cadet in the RAF station, Cherbourg. Prize Bounty for Sinking a UB-32 was awarded in the Prize Court on Monday 05 June 1919 - Lord Sterndale awarded ^ 175 prize bounty to the pilot and mechanic of H.M. Seaplane 9860, at the rate of ^ 5 a head of its crew of 35. The occupants of the seaplane were Flight Sub-Lieutenant C. S. Mossop, R.N.A.S., D.S.C., and A. E. Ingledew, at the time serving as an air mechanic and as a flight cadet in the R A F . station, Cherbourg.

## Notes on "Civil Aviation"

September 1917 : Sanction was obtained to fund the setting up at Government expense, of three new UK National Aircraft Factories, to be operated under the control of the Department of Aircraft Production.

June 1917 : UK : General Sefton Brancker, Deputy Director General of Military Aeronautics, submits proposals to "centralise the technical training of men, women and boys" in a new school to be located at Halton.<sup>89</sup>

June 1917 : UK : Cranwell station houses<sup>90</sup>:

- A. 6,000 air-men mechanics
- B. 2,000 boys at the Boys Training Depot, West Camp.
- C. 1,700 instructors and other staff.
- D. 2,000 women training in a variety of aircraft trades.

June 1917 : UK : Hugh Trenchard's view on the RFC / RAF:<sup>91</sup>

1. An ever-more technical service needing High Quality - "Skilled" mechanics
2. Similarly skilled men in the civil market who had served "full apprenticeships" could command good wages.
3. Similarly skilled men in the civil market served 5 year apprenticeships.
4. The fledgling RAF could not hope to compete with the civil market for these skilled technical trades-men
5. the only way to recruit high quality mechanics was to train them internally.
6. Start by recruiting well educated boys and train them as the nucleus of the RAF:
  1. Pre-selection examinations by their local education authorities at age 15-16.
  2. Pass the four-part the Civil Service Commissioners examination (As future Officers, the boys were joining the civil service in the United Kingdom as Crown employees):
    1. mathematics,
    2. experimental science,
    3. English,
    4. general paper
  3. Must pass the Military - RAF medical examination.
  4. Once accepted, Boy Mechanics attested for 10 years' regular service with a further two years in the reserve as RAF trades-men upon their entry into the program - their term of service commencing upon completing their apprenticeship.

7. The RAF offered incentives to the apprentices in the form of:

- A. Able to buy themselves out of the Service for £20 within the first three months (£100 thereafter)
- B. Complete their ordinary British education subjects:
  - A. English,

## Notes on "Civil Aviation"

- B. Literature and history
- C. Mathematics,
- D. Physics, and in addition
- E. Receive education on the Theory of Flight.
- C. Receive practical hands-on workshop training in repair and maintenance of Aircraft / Engines / Components.
- D. Receive Air experience - flying for boy mechanics provided on the North Airfield in the Boys' Wing's own aircraft:
  - A. a Vickers Vimy,
  - B. a DH9A, 2 Avro 504s,
  - C. a Bristol Fighter with a Falcon III engine.
- E. Complete their trades apprenticeship in 3 yrs instead of the 5 yrs that civilian tradesmen required.
- F. Complete their trades apprenticeship in one of 5 trades and / or specialisations:
  - 1. Fitter
    - A. Fitter - Aero Engines
    - B. Fitter - Armourer
  - 2. Carpenter
  - 3. Sheet Metal Worker
  - 4. Electrical
- G. Possible cadetship at the RAF Staff College for the best of the apprentices (exemplary completion of their apprenticeship by passing their school examinations as well as their trade board examinations):
  - A. pilot training while at the RAF Staff College
  - B. permanent commissions upon graduation from the RAF Staff College
  - C. Required top scores in their Ordinary British Education examinations
  - D. Required top scores in their trade's examinations which consisted of:
    - A. An Oral examination
    - B. Practical testing of their bench and assembly work
    - C. A Written Examination
- H. pre-selection for early promotion.
- I. Boy Mechanics were provided with free food, lodging and uniforms, and they were paid:

Product	Per gallon		
	£	s	d
Aviation petrol, exclusive of tin,	-	3	5
Castrol oil " R " lubricating oil, inclusive of tin	-	10	3
Oil, mineral, thick and thin, inclusive of tin	-	4	8
Castor oil, pure pharmaceutical, inclusive of tin	-	7	11
Castor oil, treated, inclusive of tin	-	8	1

- 1. 1 shilling & 6 pence per day if under 18 (1921)
- 2. 3 shillings per day if over 18 (1921)
- 3. Note that Rates of pay for RAF trades-men (1921) were:
  - 1. Aircraft-man 2nd Class: 4 shillings per day
  - 2. Corporal: 7 shillings & 9 pence per day
  - 3. Sergeant Major 1st Class: 13 shillings per day
  - 4. Cranwell Officer Cadet: 5 shillings per day
  - 5. Flying Officer: £1 & 3 shillings per day
  - 6. Wing Commander: £2 per day
  - 7. Air Chief Marshal: £7 per day

- 8. Apprentices must complete their apprenticeship by passing their school examinations as well as their trade board examinations. They are graded based upon their results and then assigned a posting to the Force.
- 9.
- 10.
- 11.
- 12.

## Notes on "Civil Aviation"

13. These skilled RAF trades-men would form 40% of all ground-crew and be 60% of the "most skilled" tradesmen in the Air Force.

14. Added benefit - their training would "foster a spirit in the RAF" on which so much would depend.

14 August 1917 : Sinking of S.S Athos by german u-boat results in deaths 500+ Chinese enroute for france.- Chine declares war on germany..

October 1919 : The Apprentice "scheme" (Programme) was promulgated to Local Education Authorities. 235 boys were accepted for the 1st three-year apprenticeship.

September 1920 : 242 boy Boy Mechanic apprentices arrived at Cranwell. (Source Ref : The 103rd Entry Association Newsletter No 8 "TRENCHARD'S BRATS BLOW OUT" By Gp Capt W J Taylor OBE RAF DD Spt Pol 2 (RAF))

January 1922 : 5th Boy Mechanic Apprentice Entry arrives at Halton - Halton's 1st. "Boy Mechanic Apprentice" re termed to "Aircraft Apprentice". The principal trades were further sub-divided into particular specialisations, such as "Fitter - Aero Engines", or "Fitter - Armourer". Having been allotted to a trade and kitted out, apprentices were also allocated to a Section (later to become known as a Wing), which served to sub-divide the huge organisation. (Source Ref : The 103rd Entry Association Newsletter No 8 "TRENCHARD'S BRATS BLOW OUT" By Gp Capt W J Taylor OBE RAF DD Spt Pol 2 (RAF))

By the end of the 1920s, the trade of "Rigger - Metal" had been introduced to prepare apprentices for work on the new generation of all-metal aeroplanes then under development. The majority of apprentices began their training at Halton, although those destined for the electrical trade went to Flowerdown, near Winchester. Having been allotted to a trade and kitted out, apprentices were also allocated to a Section (later to become known as a Wing), which served to sub-divide the huge organisation that had grown out of the former Rothschild estate. (Source Ref : The 103rd Entry Association Newsletter No 8 "TRENCHARD'S BRATS BLOW OUT" By Gp Capt W J Taylor OBE RAF DD Spt Pol 2 (RAF))

1 April 1916 : The Royal Naval Air Service Central Training Establishment Cranwell opens under the command of Commodore Godfrey Paine CB MVO Royal Navy. Cranwell includes a Boys' Training Wing to train young RNAS ratings as air mechanics and riggers.

by 1918 there were 500 RNAS boys in training at Cranwell, with numbers planned to rise to 1,500.

With the formation of the RAF in April 1918, boys' training was to be concentrated at Cranwell but, as the new brick buildings at East Camp were not yet completed, tents were used for the 300-plus RFC boys who arrived in April - from Halton of all places.

In time the boys' numbers were to rise to a total of 2,500.

Prince Albert was appointed to RNAS CTE Cranwell on 1 January 1918, and arrived in February 1918. He served initially as Officer in Charge of Boys, and later as OC 4 Sqn in West Camp. became the first member of the Royal Family to gain his pilot's certificate. He was also the only member of the Royal Family (and future King) to be married in RAF uniform.

RAF Boy Mechanic and Apprentice Training, 1918-1926 the new Air Ministry intended from the outset to create a permanent home for technical training at Halton it was decided to use Cranwell for the training of boys for the RAF until there was enough permanent accommodation at Halton.

Plans called for a student population of 2,000, with an instructional staff of 25 officers and 340

## Notes on "Civil Aviation"

airmen.

The new barrack blocks and other accommodation, begun by the RNAS, provided the wherewithal to do this, giving the boys (for the first time) hot water, real beds, mattresses and sheets. Prince Albert's Boys' Wing became a Boy Mechanics School and then a Boys' Training Wing, before being renamed as No 2 School of Technical Training (Boys) in March 1920. In April 1921 it became the Boys' Wing of the Cadet College Cranwell, which remained its name until October 1925 when it became No 4 (Apprentices) Wing. As the name suggests, by this time the training of boys had become the RAF Apprentice Scheme.

### The Apprentice Scheme

(originally known as the Boy Mechanic Scheme) was promulgated to local education authorities in November 1919, and formally opened on 26 April 1920.

The first entry of 235 boys, selected against 300 vacancies with plans for 1,000 per year, set off for Cranwell on 18 January 1921.

If desired,, initially in the old RNAS workshops in West Camp.

Indications are that the latter was broader, though not as thorough, as the training that would be provided at Halton.

Apprentice schedule						
Monday	Tuesday	Wednesday	Thursday	Friday	Saturday	Sunday
classrooms	classrooms	classrooms	classrooms	classrooms	morning – drill	
workshops	workshops	workshops	workshops	workshops	morning inspection - barracks	morning – church parade
		afternoon - sports			morning inspection - boys	afternoon - allowed out of camp
		allowed out of camp - after sports			afternoon - allowed out of camp	
Boys over 18 - allowed to smoke - only while off camp.						
no social interaction – in those days officers and airmen seldom met except on duty.						
air-men seemed to be extremely conscious of their status and certain well-defined rights that officers were at pains to respect.						

## Notes on "Civil Aviation"

Cranwell remained 'overspill' for apprentice fitters and riggers until 1926.

In 1924 there were still 981 boys in training at Cranwell, as by December of that year there was still only accommodation at Halton for 2,000 apprentices against the eventual need for 4,000. In October 1925, the Boys' Wing became No 4 (Apprentice) Wing and the last remaining Apprentices (Entries 9-14) moved from Cranwell to Halton in August 1926 – taking with them the tradition of the apprentice Pipe Band.

1925 : All apprentice training was now concentrated at Halton, with the exception of electrical and wireless training at Flowerdown, near Winchester, and armament and gunnery training at Eastchurch, near Chatham in Kent. The last entry to complete training at Cranwell was No 8, among whose 600 boys was Frank Whittle, who had joined as an apprentice rigger in September 1923. Whittle was amongst 18 Cranwell boys who were awarded cadetships at the Cadet College; three of these went on to win College Prizes, and one was the first aircraft apprentice to be awarded a Wakefield Scholarship to the College. The Cranwell boys' Wing had also produced over 60 corporals and some 600 Leading Aircraftmen (LACs) between 1920 and 1926. With the departure of No 4 (Apprentice) Wing in 1926 there was no Boy or Apprentice training at Cranwell until the arrival in August 1929 of the Electrical and Wireless School (E&WS) from RAF Flowerdown. an RFC School for Wireless Operators was formed in 1915 in the Town Hall in South Farnborough. In 1918 with the formation of the RAF these units were combined to become No 1 (T) Wireless School RAF at Flowerdown, renamed as the Electrical and Wireless School in July 1919. From 1922 the Electrical and Wireless School played its part in the RAF Apprentice Scheme, with the top 40 apprentices in each intake being sent to Flowerdown for training in what were seen as the most technically challenging trades. it was not until 1929 that the School (at that time coincidentally under the command of Gp Capt A L Godman, who had been the first Assistant Commandant of the RAF Cadet College at Cranwell in 1920-21) moved to East Camp at Cranwell. The Electrical and Wireless School trained officers as well as apprentices, and, from 1934, boy entrants were also introduced after a reorganisation of the electrical and signals trades. By 1936 the School was divided into two wings: No 1 Wing – training airmen as wireless operators (1,103 men under

training); and No 2 Wing – 152 aircraft apprentices training as Instrument Makers; 573 aircraft apprentices training as wireless operator/mechanics; 575 boy entrants training as wireless operators; officers on the 14-month Officers' Long Signals Courses, and a variety of refresher courses.

No 1 E&WS had its own aircraft, which flew from the North Airfield at Cranwell.

By 1939 these included Westland Wallace and Wapiti, Vickers Valentia, Tiger Moths and Miles Magisters. By the outbreak of war in September 1939 there were 2,500 officers and men under training in East Camp, compared to 150 or so in West Camp. Courses included:

RAFVR Officers Signals 6 months.

Aircraft Apprentice 2 years.

W Op/Mech

Boy Entrants W Op 1 year.

Airmen W Op/Mech 32 weeks.

Airmen W Mech 8 weeks.

Air Gunners W Op 12 weeks.

Airmen Teleprinter Op 5 weeks.

Nobel Prize winner 1979 received the Nobel Prize for Medicine for his work on computer-assisted tomography – what we know today as the CAT body scanner.

Cpl (sir) Godfrey Hounsfield was a Radar

Mechanic Instructor at Cranwell where,

in his spare time, he sat and passed the City and Guilds examination in Radio Communications.

T E Lawrence served at Cranwell as AC2

Shaw 1925-26, and observed: "But there is

rising up a second category of airman, the Boy Apprentice . . . Soon the ex-boy will be

the majority, and the RAF I knew will be superseded and forgotten . . . The airmen

of the future will not be owned, body and soul, by their service. Rather, they will be

the service, maintaining it, and their rights

in it, as one with the officers . . . The ex-Boys

are professionally in the RAF as a privilege,

making it their home. Soon, when they

have made their style felt, officers will only enter their airmen's rooms accompanied, by invitation, guest-like and bare-headed, like us in an officers' mess . . . The era of a real partnership in our very difficult achievement must come, if progress is to be lasting."

22 September 1917 : RFC Flight Lieutenant Norman Ashley Magor of Montreal, flying an H-12 attacks surfaced German submarine UB-32 in the North Sea, dropping two 104-kilogram bombs from an altitude of 240 metres; they exploded just behind the conning tower. UB-32 submerges, leaving a quantity of wreckage on the water - See more at: <https://legionmagazine.com/en/2016/02/the-first-air-war-at-sea/#sthash.af5DtQi1.dpuf>

28 Sept 1917 : Flight Lieutenant Basil D. Hobbs of Sault Ste. Marie, Ontario lying an H-12 attacks surfaced German minelaying submarine UC-6 in the North Sea, dropping a 104-kilogram bomb from an altitude of 180 metres; coring a direct hit on the stern with a 104-kilogram bomb. The flying-boat crew observed a large tear in the hull. Hobbs dropped another bomb, which exploded five metres off the bow. His target was sinking as he left for base - See more at: <https://legionmagazine.com/en/2016/02/the-first-air-war-at-sea/#sthash.af5DtQi1.dpuf>

October 1917 : Handley Page begin design work on the V/1500 long range bomber. 15 are built by war's end.

December 1917 : Handley Page employs 1120 workers. (2500 by 1919)

21 December 1917 : UK : an "Air Council" is set up by an Order in Council with Lord Rothermere (a newspaper magnate) as Secretary of State for Air.

November 1917 : Canadian Aeroplanes Limited employs 2,400 people and produces more than 50 aircraft a week. Valued at nearly 14 million dollars, the aircraft produced were mostly "slightly modified Canadian Curtiss JN-4s. (The total number of JN-4s produced is estimated at 1,210 complete planes plus parts equal to about 1,600 more; 30 Felixstowe F-5 flying boats designed by Commander John C. Porte of the Royal Navy were also built by Canadian Aeroplanes Limited for the American government in 1918-19. Production is so efficient that \$1,000 profit is made on each plane. The US version of the "F-5" utilised Liberty engines, which were noted by the letter "L" in its' type designation.

138 F-5Ls were produced by the United States Navy's Naval Aircraft Factory:  
60 by Curtiss, and  
30 by Canadian Aeroplanes of Toronto. .

In April 1919, one of these (Canadian Aeroplanes of Toronto?) F-5L flying boats, flown by Lieutenant H. B. Grow, set a flight endurance record of 20 hours and 19 minutes. Incidentally, George Page, a rather well-known individual in the US aviation industry, who solo'd in 1913, was one of the first to fly scheduled routes to foreign destinations as a pilot for American Trans-

## Notes on "Civil Aviation"

Oceanic [1920-21], and became Director of Engineering for the entire airplane division of the Curtiss-Wright Corporation in 1943. From his headquarters in St. Louis, George Page designed some sixty aircraft for the company including the C-46 "Commando".

1917-18 : Toronto Canada : Royal Army's Royal Flying Corps (later Royal Air Force) "Canada scheme" (Programme). The British Army's RFC and the Imperial Munitions Board established a recruitment system, an aircraft factory, and a network of bases in 1917 that trained pilots and observers and kept everything in running order. It was essentially a British operation in Canada—senior officers were all British—although the system was increasingly manned by Canadians, many of them veterans of the 1916-17 air campaigns deemed un-fit for combat. By November 1918, some 60 per cent of the instructors and 12 of the 16 training squadron commanders were Canadians. Major Albert Godfrey of Killarney, Man., commanded the prestigious School of Aerial Fighting at Beamsville, Ont. - See more at: <https://legionmagazine.com/en/2015/06/canadian-flyers-go-to-war/#sthash.Nujh0vay.dpuf>

December 1917 : Hugh Trenchard is appointed Chief of the British Imperial Air Staff, UK Air Ministry.

1917 : England : a British Handley-Page machine carried a pilot and 20 passengers to a height of 7,180 feet and another had travelled from London to Constantinople carrying 6 ¼ tons of freight

1917 : The Sopwith Snipe, the most powerful and advanced of the British Sopwith rotary-engine fighters, was intended as a replacement for the famous Sopwith Camel. It would undoubtedly have enjoyed the success of the Camel as a fighter but its wartime career was curtailed by the signing of the Armistice. It continued to serve as a fighter with the Royal Air Force (RAF) until 1926.

The Canadian ace Major W.G. Barker of Dauphin, Manitoba won his Victoria Cross flying Snipe Serial No. E8102 in one of the most spectacular air battles of WW 1, fought over Foret de Mormal near Valenciennes. William George Barker was born in Dauphin, Manitoba, in November 1894. He initially joined the Canadian Mounted Rifles and fought in the Second Battle of Ypres. When "Willy" first transferred to the RFC he went as a mechanic, but flew several missions as a machine gunner. In April 1916 he was commissioned as a Lieutenant observer and in late 1916 he returned to England for pilot training.

Witnessed by hundreds of ground troops, Barker, badly wounded and against overwhelming odds, managed to down 4 enemy aircraft before crash landing behind British lines.

The fuselage of Barker's VC winning Snipe is part of the National Aviation Museum's collection and is on display at the Canadian War Museum.

Only 9 Junkers W34 were imported to Canada due to the high cost of its metal construction and the heavy tariff imposed on German aircraft.

Canadian Airways was the primary Canadian operator.

A Junkers W34 was the first east-west trans-Atlantic flight in 1928. It landed on Greenly Island in Labrador after a 37-hour flight.

1950 : CF-ATF 1960 enters storage. construction number 2718 manufactured in 1931 had been and operated by various Canadian operators.

1962 Junkers W34 CF-ATF was flown from Kamloops, BC to the Sydney BC Air Museum. (The 1962 "Canadian" flight was the last flight of any of the Junkers F13/W33/W34 family of aircraft - anywhere!)

Much of the work to open up Canada's north in the 1920s and 1930s was performed by Fairchild FC-2s, 2Ws, and 2W-2s. FC-2W-2s flew Canada's first international passenger service between Montreal and New York.

1928, 2 Canadian Airways FC-2W-2s were the first to reach Junkers W.33 "Bremen", which crashed in the Strait of Belle Isle after the first east-to-west trans-Atlantic flight.

## Notes on "Civil Aviation"

The Fairchild's wings fold back for convenient storage, which meant that in the Arctic the airplane could be put undercover with a small snow-fence and a tarpaulin.

*The specifications of the British Government, for example, provide for two lights on the instrument board, carefully shielded from the pilot's eyes.*

Another light is placed at the bottom of the fuselage, or car of the aeroplane in case of need. This may be of service in adjusting the machinery or to operate bomb-dropping devices.

A special light shines on the compass and one portable torch is carried by each machine. If an aeroplane is not equipped with a special motor for supplying current, dry batteries are carried that may be thrown overboard when exhausted.

A single firm in the United States had orders for twenty-five large airboats to be delivered in the spring of 1917. The cheapest of these cost \$8500 while the more sumptuously fitted craft sold for \$10,000.

The sport, by the way, is likely to be expensive.

A pilot familiar with the complicated engines used in these craft commands a salary of around \$4.0 a week, and the machinery must be fed only high-grade gasoline.

As late as 1914, or the year before the War, the wireless outfits were bulky affairs, weighing from three to five pounds for every mile of transmission.

The aeroplanes of that period could carry comparatively little weight so that wireless apparatus of effective range could not be taken aloft.

The system has been so perfected that to-day the wireless sets weigh only one pound for every mile of transmission, and the carrying capacity of the aeroplanes meanwhile have been greatly increased.

The first official flight to Washington was made by Congressman O. D. Bleakley, of Pennsylvania in the autumn of 1916, "driven" by Sergeant Ocker of the Flying Corps,

Mr. Bleakley took the air at Philadelphia at two thirty one afternoon, flying at an altitude of about a mile.

The distance from Baltimore to Washington was covered in twenty-five minutes, making less than three hours for the entire trip. The landing was negotiated without mishap on the polo grounds.

The congressman, who is over sixty years of age, was enthusiastic about his flight.

*"We can all remember the early days of flying when a fee of several thousand dollars was demanded by an aviator for flying a few miles.*

*Today, thousands of air-pilots are engaged in the aviation corps of many armies at small salaries.*

*It is safe to prophesy that these chauffeurs of the air may be hired within a few years at a cost of around fifty dollars a week." - U.S Congressman O. D. Bleakley - Pennsylvania*

Being called "chauffeurs of the air" and the thought of getting paid "fifty dollars a week" when others of the day were naming their own price - and announcing this for all to know - for their service as a pilot more than likely ruffled a few feathers .....

Flying Corps - Canada

Since the beginning of 1917

Aeroplanes are now being manufactured in Canada for use in the war.

High class Aeroplane-Training Schools are in operation

Under an arrangement between the British and Canadian governments,

Canada has secured both extensive flying schools and airship factories.

The Imperial War Office has established Royal Flying Corps "Reserve Squadrons" in Canada to train replacement pilots in which young Canadians are being trained for service in the Imperial Army's flying corps.

## Notes on "Civil Aviation"

Canadians already serving in the Imperial Air Corps are doing so with "marked distinction".

Source : Canada's Effort IN THE GREAT WAR TO MARCH, 1917

The Imperial Munitions Board - Canada

The proportions of the business conducted by the Imperial Munitions Board:

February, 1916 : The Imperial Munitions Board - Canada:

1. employs a head office staff of 150, and
2. 2,300 factory, machine shop and testing inspectors.
3. engages 454 firms in the production of shell parts and explosives and in their assembling and loading.

March, 1917 : The Imperial Munitions Board - Canada:

1. employs a head office staff of 700, and
2. 4,000 factory, machine shop and testing inspectors.
3. Has, With financial assistance from the Canadian Government, erected important aeroplane factories at Camp Borden and other points.
4. engages 630 firms from Halifax, NS to Victoria, BC employing upwards of 200,000 persons in the production of shell parts and explosives and in their assembling and loading. The weekly expenditure is \$5,000,000.
5. keeps all firms engaged and working under a comprehensive plan to avoid confusion and waste. **The task of supervision is a heavy one.**

Source : Canada's Effort IN THE GREAT WAR TO MARCH, 1917

The "Canadian" Munitions Resources Commission [Colonel Thomas Cantley - Chairman]:

1. has contributed greatly towards the pronounced success of the Munitions business in this country.
2. has had the supply of raw materials for the manufacture of munitions constantly under review and its activities have, therefore, proved substantially useful to the Canadian public as well as to the cause of the Allies.
3. has taken early steps to furnish the industry with the necessary quantity of tool steel or high speed steel.
4. After circularizing the domestic munition makers, made arrangements with the British Ministry of Munitions for an adequate supply of [tool steel or high speed steel] an essential material.
5. is promoting the production of tool steel within the Dominion.

**1917 BRITISH WAR CABINET REPORT**

The period began with a reconstruction of the administrative machinery at the War the centre. It had become increasingly evident that Reore-ani \*^® older system under which the supreme direction sation. ^ ^ ^ ^ ^ war rested with a Cabinet consisting of the departmental chiefs under the Chairmanship of the Prime Minister, was not sufficiently prompt and elastic for the conduct of a war which involved the mobilisation and direction of the resources not only of the United Kingdom but of the British Empire.

Even the formation of a smaller Cabinet Committee of the departmental Ministers chiefly concerned in the war did not meet the needs of the case. With the advent of the new Government, a modification was introduced whereby the supreme direction of the war was entrusted to a small War Cabinet, freed from all administrative duties, and yet in the closest touch with all departmental Ministers, while administrative responsibility was placed in the hands of Ministers who were left free to devote their whole time to this aspect of governmental work.

By this arrangement the War Cabinet were able to give all their attention to the task of co-ordination and direction, and so make more effective use of the immense resources which the Empire had gradually produced during the preceding years. It also made it easier to create a number of much needed new "administrative departments".

The most important of these departments were:

1. the Ministry of Shipping,
2. the Ministry of Labour,
3. the Ministry of Food, and
4. the Ministry of Pensions,

to which were added at later dates:

5. the Ministry of Reconstruction ,
6. the Ministry of National Service, and
7. the Ministry of the Air.

## **ADMINISTRATIVE ORGANISATION**

### **A. The War Cabinet.**

The most important constitutional development in the United Kingdom during the last year has been the introduction of the War Cabinet system.

This change was the direct outcome of the war itself. As the magnitude of the war increased, it became evident that the Cabinet system of peace days was inadequate to cope with the novel conditions.

The enlarged scope of Government activity and the consequent creation of several new departments, made a Cabinet, consisting of all the Departmental Ministers meeting under the Chairmanship of the Prime Minister, far too unwieldy for the practical conduct of the war.

It was extremely difficult for so large a body to give that resolute central direction which became more imperative the more the population and resources of the nation had to be organised for a single purpose—the defeat of German militarism. Even the development of a comparatively small War Committee did not entirely meet the needs of the case, as the final responsibility rested not with them but with the Cabinet.

With the change of government, therefore, a new method of governmental organisation was introduced.

The system of the War Cabinet distinguishes between:

1. the body, which is responsible for the supreme direction of the war, and
2. the Ministers, who have charge of the great administrative departments of State.

The general direction of the policy of His Majesty's Government during the war rests with the War Cabinet, whose members with one exception, are relieved of the day to day pre-occupations of administrative work, and whose time is, therefore, entirely available for initiating policy and for the work of co-ordinating the great Departments of State.

The introduction of the War Cabinet system has resulted in considerable modifications of the administrative system of the Government. In the first place, it freed the various departmental Ministers from the constant necessity which rested upon them under the old Cabinet system of considering those wider aspects of public policy which often had nothing to do with their

## Notes on "Civil Aviation"

departments, but for which they were collectively responsible.

They are, therefore, now able to devote a far larger part of their time to those administrative duties, which have become more exacting as the national activities have expanded under the pressure of the war. Secondly, it has made possible an increase in the number of Ministerial offices so as to effect a better distribution of functions.

The new Ministries created since the introduction of the War Cabinet are:

the Ministry of Labour,  
the Ministry of Shipping, the Ministry of Food, the Ministry of the Air, the Ministry of National Service, the Ministry of Pensions and the Ministry of Reconstruction.

It has been felt for some time that, in view of the ever increasing part played by the Dominions in the war, that it was necessary that their Governments should not only be informed as fully as was possible of the situation, but that, as far as was practicable, they should participate, on a basis of complete equality, in the deliberations which determined the main outlines of Imperial policy.

Accordingly, one of the first acts of the new Government was to send a telegram on December 14th inviting the Dominion Prime Ministers, not to an ordinary Imperial Conference but to a Special War Conference of the Empire, in the following terms :

" They therefore invite your Prime Minister to attend a series of special and continuous meetings of the War Cabinet in order to consider urgent questions affecting the prosecution of the war, the possible conditions on which, in agreement with our Allies, we could assent to its termination, and the problems which will then immediately arise. For the purpose of these meetings, your Prime Minister will be a member of the War Cabinet."

Canada was represented by:

1. the Prime Minister, Right Hon. Sir Robert Borden, and
2. the Minister of the Overseas Military Forces, Hon. Sir George Perley,

They were accompanied by:

3. the Minister of Public Works, Hon. Eobert Eogers, and
4. the Minister of Marine Fisheries and Naval Service, Hon. J. D. Hazen,...

For the first time in the history of the British Empire there were two Cabinets sitting in London, both properly constituted and both exercising well-defined powers.

One Cabinet, designated the 'War Cabinet' chiefly devoted itself to such questions touching the prosecution of the war as primarily concerned the United Kingdom.

The other Cabinet, designated the 'Imperial War Cabinet' has a wider purpose, jurisdiction and personnel.

The Prime Minister of the "United Kingdom" presides over each of them.

Air Board.

The Derby Committee was followed by a decidedly more definite step in the direction of co-ordination with the appointment of the first Air Board in May, 1916, under the Presidency of Lord Curzon.

On this Board the Army Council and the Board of Admiralty were directly represented in the persons of"

1. Sir David Henderson (then Director-General of Military Aeronautics), and
2. Rear-Admiral (now Sir) F. C. Tudor, then Third Sea Lord.

The Air Board differed from the preceding Committees in intention, composition and duties, which were intended to be considerably wider in scope than those of a mere mediator between the two services in matters of supply.

The Air Board was empowered:

1. to discuss matters of policy "in relation to the air",
2. to make recommendations to the Admiralty and War Office, and,
3. in the event of those Departments declining to act upon its recommendations, to refer the matter to the War Committee.

It was further announced in the House of Lords by Lord Curzon that the Air Board would review, among other questions:

1. the possibility (which had been mooted at the time of the appointment of the Derby Committee) of the amalgamation of the supply and design branches of the two services, as well as

## Notes on "Civil Aviation"

2. in the further background, the desirability or possibility at a future date, of creating a single Department under a single Minister.

The first Air Board thus possessed a far wider ambit of suggestion than either of the two earlier Committees, and it enjoyed the superior prestige attaching to it from the Presidency of a Cabinet Minister who was also a member of the War Committee. No executive functions were, however, attributed to the Air Board.

The next stage was reached with the formation of the second Air Board under the New Ministries and Secretaries Act, 1916, following upon a report by Lord Curzon to the War Committee, in which a considerable extension of the powers of the Board was recommended.

Lord Curzon had retired from the Presidency of the Air Board upon his becoming a member of the War Cabinet under the Premiership of Mr. Lloyd George, and he was succeeded on the board by Lord Cowdray in January, 1917.

A month later the Air Board was able to submit for the approval of the War Cabinet a draft of the Charter defining its functions and duties which, after discussion, had been settled with the Admiralty and the War Office as follows:

1. The Director of Naval Air Services was given a seat on the Board of Admiralty as Fifth Sea Lord, and
2. the Ministry of Munitions was made responsible for the supply of :
  1. all heavier-than-air craft for both services
  2. all heavier-than-air craft engines for both services
  3. the supply of all heavier-than-air craft accessories for both services,
3. in accordance with the aerial policies determined by the services in concert with the Air Board, the Air Board became responsible for:
  1. the design of the aircraft between the two services, and
  2. for the allocation of the aircraft between the two services.

Two members of the Ministry of Munitions were added to the Board:

1. the Controller of Aeronautical Supplies and
2. the Controller of Petrol Engines.

In February 1917, the Departments of the Controller of Aeronautical Supplies, of the Director-General of Military Aeronautics, and of the Director of Naval Air Services were transferred to the Air Board Office.

The various authorities concerned with aviation were thus for the first time housed under one roof.

Such an arrangement (though subsequent developments have led to the occupation of other adjacent buildings) was clearly of a nature to facilitate the amalgamation not only of the departments of design and supply but also of the combatant services themselves if events proved such a measure to be desirable.

It is now necessary to discuss the factors which led to the transformation of the second Air Board into the fully equipped and independent - Ministry which is, at the date of the Report, in course of organisation.

At the time of the formation of the second Air Board, the requirements of the two services in the matter of aircraft were far from satisfied, and during the first six months of its existence the whole of its energies were devoted to increasing supply in order to meet those requirements.

By the middle of the summer of 1917 the situation had improved so much that the Board was in a position not only to look forward to the day when the needs of the two services would have been met but also to anticipate the creation of a substantial surplus of aircraft beyond those needs. It then became necessary to take measures for the utilisation in the most effective manner of these additional aircraft.

This gave rise to "questions of policy" which the Board, constituted as it was, was unable to solve. An Air War Staff became a necessity in order to consider problems of aerial offensive and defensive distinct from those connected with the operations of the army and the navy. The need for such a body was pointed to by the obviously increasing importance of these problems.

The speed, range and carrying capacity of aircraft were reaching a stage of development almost unsuspected at the beginning of the war. It was possible to envisage from the results of bombing operations already practised on lines of communication and other places behind the enemy's lines the effect which the extension of these operations might have upon the determination of

## Notes on "Civil Aviation"

a struggle which, as regards the conflicts of the opposing armies on the western front threatened to reach, if not a deadlock, at all events a condition where victory might only ensue by a long and costly process of attrition.

From the point of view of defence, the new arm of His Majesty's forces presented problems pregnant with at least equal importance. The proud and ancient inviolability of these islands was being challenged in a new and startling fashion, and the seriousness of the problem was added to by the fact that the geographical position of the capital of the Empire rendered it particularly inviting to attack from the air. The menace of the lighter-than-air craft seemed in a fair way to be overcome, but it was clear that the possibilities of attack by bomb-carrying aeroplanes were not yet either measured or mastered, and any arguments based on the assumption that the uses of aircraft were purely ancillary to military or naval operations were being refuted by the logic of fact and experience.

The Air Board, however, possessed neither the staff nor organisation to enable it to cope with these problems. The President of the Air Board was without that body of technical advice which alone would enable him to form a correct judgment as to the relative importance of the different methods of employing aircraft.

For technical advice of this kind he could look only to the naval and military members of the Board who sat there mainly as representatives of the Board of Admiralty and of the Army Council.

These considerations led to Lord Cowdray's addressing, on July 28th, 1917, to General Smuts (as the member of the War Cabinet charged with the general supervision of air matters) his view that the Air Board should be turned into a permanent Ministry, that it should have a War Staff to consider the best use to be made of aircraft not needed directly by the operations of the army and the navy, and that the surplus aircraft should be considered a distinct unit from the air contingent attached to the Expeditionary Force.

On August 24th the War Cabinet decided to accept in principle the establishment of an Air Ministry, and also decided that a further Committee should meet at once to work out a "scheme" (Programme) for giving effect to this decision. This body consisted, under the chairmanship of General Smuts, of representatives of the Admiralty, War Office, Treasury and Air Board, and was known as the Air Organisation Committee. The appointment of the Air Organisation Committee was a necessary administrative corollary to the decision taken by the War Cabinet on the question of principle.

The absorption of the two branches of the air service into a "single service" would at any time have been a matter of complexity, and the task was one of which the delicacy was enhanced by the fact that it was to be brought about in the middle of a great war and at a time when those concerned in the amalgamation were carrying a burden of responsibility and administrative work, the daily performance of which could suffer no interruption or delay.

It was essential, therefore before any legislative action was initiated that the ground to be covered should be carefully plotted out, and this was the task which fell to the Air Organisation Committee.

The nature of its inquiries may be indicated under the following statement of some of the questions which were dealt with :

1. the legislation needed for the establishment of an Air Force and of an Air Council to administer it ;
2. the constitution of the Council, its membership and the appointment of duties between the members ;
3. the organisation of the Air Ministry and the duties of its officials;
4. the question of supply in all branches, the rates of pay, conditions of service and pension allowances, the relation between the Air Ministry and Air Force and the War Office and Admiralty and Army and Navy ;
5. the preparation of King's Regulations and other matters relating to discipline etc.

On the majority of these questions the Air Organisation Committee was able to arrive at an agreement with the departments concerned. It is, however, only right (if a just perspective is to be maintained) to emphasise the importance of the contribution to the unification of the two services which had been made when their headquarters' staffs became housed under one roof.

The opportunities for daily conference on almost every subject of aeronautical administration which naturally ensued—together with the link provided by a joint system of supply and design—was probably an essential preliminary to the task of unification.

The Ministry of Air.

Following upon the discussions of the Air Organisation Committee, the Air Force Bill was introduced into the House of Commons in November 1917., It met with no opposition of principle in either House and received Royal Assent on November 29th.

## Notes on "Civil Aviation"

The "scheme" (Programme) of the Air Force Act contemplates that "*the whole of the personnel and equipment of the R.F.C. and R.N.A.S. should be in due course absorbed by the Air Force under the control of an Air Council presided over by a Secretary of State and exercising functions analogous to those of the Army Council.*"

**NOTES:** Similar to the UK, the Canadian Department of Militia and Defence was responsible for Canadian Army purchases and the Department of Naval Service, for those of the Royal Canadian Navy (RCN).<sup>92</sup>

In May 1915, a War Purchasing Commission responsible to the Privy Council was appointed to oversee all Canadian war purchases as well as all contracts placed by international allies with businesses and industries across Canada, except for those of the British government that fell within the scope of the Shell Committee and its successor, the Imperial Munitions Board. The creation of the War Purchasing Commission allowed the Canadian government to control and coordinate defence procurement and war production in Canada more effectively and efficiently.<sup>93</sup>

### 2.3 The Imperial Munitions Board (1915–1919)

In November 1915, the Shell Committee was replaced by an Imperial Munitions Board directly responsible to the British Ministry of Munitions. It coordinated all British government orders in Canada for foodstuff, strategic raw materials, and manufactured products, including war materiel. The Imperial Munitions Board completely reorganized the Canadian industrial war effort and operated its own network of "national factories" to furnish any products that private companies were unable to produce. Canadian war production expanded significantly under its leadership. When the war ended in November 1918, more than 675 factories across Canada had worked on Imperial Munitions Board contracts.<sup>94</sup>

## 3 The Interwar Years, 1919–1939

### 3.1 Return to Pre-War Procurement Practices (1919–1939)

In Canada, the centralized system of procurement and war production set up during the First World War was abandoned in 1919 with the dissolution of the War Purchasing Commission and the Imperial Munitions Board. The Canadian Departments of Militia and Defence and of Naval Service became, once again, independently responsible for Canadian Army and RCN procurement, respectively.

The Canadian Air Board established in 1919 (*renamed "the Royal Canadian Air Force", or RCAF, in 1924*<sup>95</sup>) was responsible for its own purchases.<sup>96</sup>

In 1923, the Canadian National Defence Act came into effect, amalgamating the Canadian Department of Militia and Defence, the Department of Naval Service, and the Air Board into a new Department of National Defence (DND). The amalgamation was effected for reasons of economy and to improve the coordination of defence policy in Canada.

While the establishment of DND brought Canada's army, navy, and air force together under a single minister, the three armed services remained separate and independent legal entities, with their own chiefs of staff, headquarters, budgets, human resources, and procurement practices.<sup>97</sup>

When Canada declared war on Germany on 10 September 1939, the Mackenzie King government decided to further centralize defence procurement and production under a separate federal government department with its own minister and much wider powers than the pre-war Defence Purchasing Board. The Department of Munitions and Supply Act, passed by the Canadian Parliament on 12 September 1939, provided for the eventual establishment (when it was deemed necessary) of a new

## Notes on "Civil Aviation"

"Department of Munitions and Supply" that would direct the purchase, production and distribution of Canadian defence products.<sup>98</sup>

In the interim, a Canadian "War Supply Board" responsible to the Minister of Finance was created by order in council on 15 September 1939 and replaced the Defence Purchasing Board on 1 November 1939. The powers of the War Supply Board extended beyond those of the Defence Purchasing Board and included the mobilization and organization of Canadian industry for the war effort. It was also empowered to coordinate all defence contracts placed by the British and French governments in Canada. Responsibility for the War Supply Board was eventually transferred to the Minister of Transport, on 23 November 1939.<sup>99</sup>

[END of NOTES <sup>100</sup>]

It was fortunately not necessary to provide the new force with a complete and original code of administration co-extensive with the codes by which the Navy and Army are governed and which are made up of an accretion of centuries of experience. The actual administration of the Air Force would clearly offer many analogies to that of the Army, and it was found practicable to adopt with modifications the Army (Discipline) Act to regulate the discipline of the Air Force. (Change the KR&O for the "Army" to read as KR&O for the "Air Force" and replace every instance of the word "Army" with the words "Air Force" and Bob's your Uncle!)

Similarly, the Crown is empowered by Section 13 of the Air Force (Constitution) Act to *apply, with any necessary modifications to the Air Force, any of the various enactments relating to the powers, rights and duties of the Army or of its officers and men*. It was not to be expected that the new department could spring forth fully armed from the decisions of the Legislature.

The provisions of the Air Force (Constitution) Act represented the fruits of a careful preliminary exploration by the Air Organisation Committee, but there remained important steps in the detailed organisation of the new Force which could not be undertaken until the Bill became law.

One of the first steps in reorganisation was a readjustment of the positions of the Technical Department of the Air Board, which was responsible for the design of aircraft, and the Aeronautical Supply Department, under the Ministry of Munitions, which was under the charge of Sir William Weir, who was also a member of the Air Board. These changes, made when the Air Force Bill became law, unified the functions of the two Departments.

The next step was to set up the Air Council and to define the duties of its members. This was done by "Orders in Council" issued December 21st, 1917 to set up the Air Council, and on January 2nd, 1918 to define the duties of its members.

On January 2nd, 1918 Lord Rothermere (who had been appointed President of the Air Board on November 23rd, following Lord

Cowdray's resignation) was appointed Secretary of State for Air.

The appointments of the other members of the Air Council were announced at the same time :

Lieutenant-General Sir David Henderson, K.C.B. (additional member and Vice-President) ;

Major-General Sir Hugh Trenchard, K.C.B. (Chief of the Air Staff) ;

Kear-Admiral Mark Kerr, C.B. (Deputy-Chief of the Air Staff) ;

Commodore Godfrey Paine, C.B. (Master-General of Personnel) ;

Major-General W. S. Brancker (Comptroller-General of Equipment) ;

Sir William Weir (Director-General of Aircraft Production in the Ministry of Munitions) ;

Sir John Hunter, K.B.E. (Administrator of Works and Buildings);

Major J. L. Baird, C.M.G., D.S.O., M.P. (Parliamentary Under-Secretary of State).

The Air Council was now engaged, in consultation with the Admiralty and the War Office and other Departments concerned, in completing arrangements preparatory to the assumption of full administrative and executive responsibilities.

It is convenient here to refer to two matters in which some misunderstanding may have existed as to the seat of responsibility:

## Notes on "Civil Aviation"

- (1) Home defence against air raids.
- (2) The control of lighter-than-air craft.

The former is under the control of the Field-Marshal Commanding the Home Forces, and the Air Council is not responsible for it. Aircraft, anti-aircraft guns and searchlights for the defence of London have been united under the immediate command of a single General Officer.

Elsewhere in the United Kingdom the guns and lights are under the local General Officer Commanding-in-Chief, while the aircraft has been grouped under the General Officer Commanding a Brigade.

Section 3 of the Air Force Constitution Act, however, provides that units of the naval or military forces engaged in defence against aircraft may, by arrangement with the Admiralty or Army Council, be attached to the Air Force. The foregoing refers mainly to aeroplanes and seaplanes, the airship, and to a lesser extent, the kite balloon, having been administered on somewhat different lines. (•2) Up to the end of December, 1912, the Army and the Navy had both been experimenting with airships, but at that date the Army Council decided to relinquish this work, and, consequently, the military airships and personnel were transferred to the Admiralty on the 1st January, 1913, and henceforth airships were experimented with and administered solely by the Admiralty.

At the outbreak of war there were only five small airships in existence, and little progress was made until March, 1915, when the first S.S. (Submarine Scout) type airship was produced and a programme embarked upon. Since March, 1915 considerable development has taken place and non-rigid airships form an important part of the anti-submarine measures, while rigid airships are being constructed by the Admiralty with a much wider range of action than is possible for the smaller non-rigid air craft.

On the formation of the Air Force, though the principle was agreed to that ultimately airships should be transferred to the new authority, it was decided that until this branch of the service had become settled on a more solid foundation the responsibility for the design, production and administration should remain with the Admiralty. Admiralty personnel will be transferred to the Air Force while remaining with the Admiralty for production and administrative purposes. The kite balloon was originally taken up by the Navy in March, 1915, and their example was followed by the Army, whose first three land sections in France were manned by naval personnel.

It was later arranged that the second Air Board should be responsible for the whole of the supply of R.F.C. requirements, though the Admiralty remained responsible for the provision of a considerable portion of the demands for naval kite balloons. On the formation of the Air Force the whole responsibility for kite balloons will pass to the new body.

Reference should be made to some of the organisations subsidiary to the central authority whose evolution has been traced in the preceding paragraphs.

### Inventions.

The administrative separation of the two branches of the service reflected itself in the arrangements for dealing with aeronautical inventions, the consideration of which was divided between:

1. the Board of Invention and Research under the Admiralty,
2. the Munitions Inventions Department under the Ministry of Munitions, and
3. the Directorate of Military Aeronautics under the War Office.

This division of responsibility possessed obvious disadvantages in a matter where the co-ordination of all sources of knowledge and experiment was of prime importance, and one of the duties with which the first Air Board was charged was the organisation of a system of further interchange of ideas on air problems between the two services.

Proposals to this end were put forward by Lord Curzon without securing acceptance from some of the parties whose concurrence was essential, and a settlement of the problem was not reached until the middle of 1917, when an "Air Inventions Committee" was appointed by Lord Cowdray, to which was transferred all duties in connection with the examination of inventions relating to heavier-than-air craft. This Committee works in close cooperation with the Advisory Committee on Aeronautics.

### Civil Aviation.

## Notes on "Civil Aviation"

A Committee known as the Civil Aerial Transport Committee was appointed in April, 1917, under the chairmanship of Lord Northcliffe to consider :

1. "The steps which should be taken with a view to the development and regulation, after the war, of aviation for civil and commercial purposes, from a domestic, an Imperial, and an international standpoint", and
2. "The extent to which it will be possible to utilise for the above purposes the trained personnel and the aircraft which the conclusion of peace may leave surplus to the requirements of the naval and military air services of the United Kingdom and Overseas Dominions."

The Committee at the outset divided its enquiry into five branches and entrusted each to a special sub-committee, as follows :

1. Questions of law and policy.
2. Technical questions as to the performance of aircraft and the requirements of aerial services.
3. Business questions relating to the position of the aircraft manufacturing industry after the war.
4. Labour questions.
5. Problems of research and education.

Reports by all the five Sub-Committees have been drawn up and are now under consideration by the Main Committee.

### Medical Research

A Medical Research Committee, appointed in March, 1917, has performed valuable services to the investigation of the various physiological phenomena produced by flying at high altitudes and kindred subjects. It has been found by experience that flying men are subject to many peculiar disabilities, and considerable progress has been made in the methods of prevention and cure of these disabilities.

### Supply of Aircraft.

The above recital indicates generally what steps have been taken in matters of administration and control. It should be supplemented by some general account of the measures taken as regards supply of aircraft and the development of that supply.

In endeavouring to describe the measures taken to meet the aircraft needs of the Navy and Army, the writer is at once confronted

by the fact that *the information desired by the country is precisely the information desired by the enemy.*

What the country wants to know is:

1. what has been the expansion in our Air Services ;
2. whether we have met and are meeting all the demands of the Navy and of the Army, both for replacement of obsolete machines by the most modern types and for the increase of our fighting strength in the air ;
3. what proportion of the national resources in men, material and factories is being devoted to aviation ;
4. what the expansion is likely to be in the future.

These are precisely the facts which we should like to know with regard to the German air service, and for that reason it would be inadmissible for us to supply Germany with corresponding information about ourselves by publishing a statement on the subject.

It can be said that the expansion of our Air Services is keeping pace generally with the growing needs of the Navy and the Army.

The brilliant part played by the Royal Flying Corps and the Royal Naval Air Service in the battles of the Somme, Vimy, Messines and Ypres has been described by the Commander-in-Chief, who has also borne frequent testimony to the inestimable value of the work performed daily and nightly by the two air services. It is fair to say that not even the well-known superiority of our airmen over those of the enemy would have enabled them to have earned the Commander-in-Chief's praise in so unstinted

a measure unless they had been supplied with satisfactory machines and equipment from home. It is rather the fashion to criticise the quality of our machines. Most of the critics, however, are ignorant of the technical and manufacturing difficulties which have to be overcome in order to keep up a constant and increasing supply of the most up-to-date machines.

Not only are the technical difficulties and the resultant research and experimental work formidable in themselves, but the task of building up in war time, without seriously affecting the requirements of other services, a new industry of a most highly skilled character necessarily puts a heavy strain upon the organising and manufacturing ability of the country.

The growing realisation of the increasing importance of aviation as an artificer of victory has recently been reflected by the concession of first priority to labour and materials required for aircraft production.

## Notes on "Civil Aviation"

The nature of the duties performed by the Royal Naval Air Service, both in conjunction with the fleet and from naval bases, makes secrecy essential to success. It is, unfortunately, inevitable, therefore, that the public should remain in the dark on this subject; but the Germans, who in this matter are perhaps the best judges, have good reason to know and to regret the great and growing activities of the Royal Naval Air Service. All that has been said regarding the difficulties of supplying the requirements of the Air Forces operating over the land applies equally to the supply of those which operate over the sea. In both cases difficulties are being overcome and the outlook is improving.

The science of aeronautics is in a state of constant and rapid development; improvements in engines, aeroplanes and their numerous accessories are constantly being worked out. But the interval between the discovery of an improvement and its introduction into the service is, owing to technical considerations, very much longer than is commonly supposed. Experience shows that, as a rule, from the date of the conception and design of an aero-engine to the delivery of the first engine in series by the manufacturer, more than a year elapses; the corresponding period for an aeroplane is about one half as long. Consequently, plans have to be laid for a long period ahead, and these plans are liable to be upset by many uncertain factors. The hopes based upon the promising results given by the first experimental engines of a new design are frequently disappointed owing to difficulties of bulk manufacture or to defects only developed after long trial in the air; new types of aeroplanes favourably reported on when first tried are found on longer experience not to give complete satisfaction, and yet it is impossible, if we are to keep ahead in the keen struggle for aerial superiority, to wait for full experience before placing orders. Risks must be run, and new types must be adopted at the earliest moment consistent with reasonable assurance that they will constitute a substantial improvement on what is already in use. Orders must be placed, moreover, for considerable numbers and for delivery over many months, as the large output required for our present flying services can only be obtained by bulk orders permitting a high degree of subdivision of work.

The next step in the problem is the balancing of the engine and the aeroplane programmes. Owing to the much longer period required for the production of engines than of aeroplanes, orders for the former must be placed for relatively long periods ahead, before it is known what types of aeroplanes will be required when the engines become available.

The problem is complicated by the fact that manufacture and delivery rarely if ever proceed in accordance with anticipation. The output of a particular type may be delayed for weeks or even months owing to some technical difficulty of manufacture.

Moreover, as replacement of losses and expansion are proceeding simultaneously in the flying services, and the rate of wastage in different types of engines and of aeroplanes varies considerably according to circumstances, it is impossible to forecast with accuracy what engines will be available for the equipment of new types of aeroplanes after wastage has been made good. Nor is it possible to any great extent to adjust the programme by modifying orders once placed without disorganising supply.

The problem does not end here. Whenever a new type is introduced provision must be made for accumulating a sufficient "head of spare engines, spare aeroplanes and spare parts of innumerable kinds, to keep the squadron to be equipped with that type in a condition to make good the day-to-day wastage and carry out the constant repairs required.

Such being the nature of the problem, it is satisfactory to be able to record that during the year 1917 not only was the number of squadrons of aircraft on the various fronts increased in a notable degree, but there was a complete replacement of machines and engines of the older types.

The very great increase in output which is being obtained has placed a considerable strain on the workers in the aircraft and aero-engine factories of the country, a strain which is being met on the whole in a satisfactory manner.

The difficulties in connection with production are aggravated by the competing claims of many different types of aero-engines.

## Notes on "Civil Aviation"

Standardisation is the ideal but it is obviously difficult of attainment having in view the importance of not losing time in production and at the same time of keeping abreast with the very latest developments necessitated by the need for constant increase of horse-power and higher performance.

The Air Council are most keenly impressed by the need for concentration on a few approved engines, and they have the whole question of the reduction of numbers of types under constant and careful consideration.

Attention was drawn, on more than one occasion, by manufacturers to the importance of maintaining the interest of workers in aircraft factories in the highly important but generally monotonous work on which they are employed.

Engaged, as they frequently are, on the production by a repetition process of some small part of an aeroplane, these men and women find it difficult to realise that they are contributing effectively to one of our most valuable instruments of warfare.

It was accordingly arranged that Captain Ewart, E.F.A., well known as a writer by the name of "Boyd Cable," should visit various squadrons at the front and gather materials and photographs for lectures concerning the exploits performed with various types of aircraft for delivery to the workpeople engaged on the manufacture of those particular types.

Captain Ewart delivered several series of lectures which, judging from the reports received from the factories concerned, proved a very great success.

### Ministry of Munitions 1917 -

#### Aircraft.

The chief of the new supply functions which have fallen upon the Ministry of Munitions during the period under review is the responsibility for the provision of aircraft, the transfer of which was effected as from the 1st March, 1917.

This involved the absorption of a very large organisation and has resulted in greatly increased output. It will be remembered that this industry is almost entirely a creation of the war, most of the largest firms with which the Ministry now deals having actually been brought into existence since the outbreak of war, while further important extensions of capacity are now in progress.

When the Ministry of Shipping was formed, the Shipping Controller had taken over from the Admiralty the bulk of the work of the Transport Department of the Admiralty, and he had also assumed the responsibility for merchant tonnage construction. Merchant tonnage construction now reverted to the Admiralty.

In order to assist the Controller in his onerous duties, three new Deputy-Controllerships were created,

1. Dockyards and Shipbuilding,
2. Auxiliary Shipbuilding, and
3. Armament Production (including Aircraft).

*The design and production of all heavier-than-air aircraft, however, remained with the Air Board and Ministry of Munitions.*

The Royal Naval Air Service at the outbreak of war possessed a personnel of under 800; at the present moment the numbers approach 46,000 and are continually increasing.

Their materiel after the outbreak of war consisted of seven non-rigid airships, considerably less than 100 efficient seaplanes and aeroplanes, and no kite balloons.

At the present time there are some 176 airships and kite balloons, well over 2,500 seaplanes and aeroplanes, and a great number of motor boats and subsidiary appliances of all kinds.

Attention has been called to the work of the squadrons in Flanders. Mention must also be made of the great value of the air services in combating the submarine menace round our coasts.

## Notes on "Civil Aviation"

Here, again, detailed particulars of the services performed cannot justifiably be given, but as illustrating their extent it may be stated that in one week the aircraft patrol round the British coasts alone flies 30,000 miles.

The Royal Naval Air Service during the past year has also rendered much assistance to our armies in Macedonia, Palestine, and East Africa, and squadrons have been attached to our army on the Western Front, where they are believed to have destroyed or driven down out of control nearly 400 enemy machines during the last year.

The Commander-in-Chief, Sir Douglas Haig, has borne testimony to their efficiency and gallantry. In other fields of action, the bombing of the Turkish Fleet in the Golden Horn, in July, and the destruction of the bridge at Namur, in September, will be remembered out of innumerable gallant and heroic exploits.

Although now technically a part of the Army, and serving as a unit of the British Expeditionary Force on the Western Front, mention must be made of the Royal Naval Division, who are worthily upholding their tradition of Gallipoli, and are acknowledged to be second to none in the manner in which they carry out the duties and tasks allotted to them.

Royal Flying Corps.

To take some special services by themselves, the Royal Flying Corps has shown a very remarkable development. The number of units, for instance, formed in the past year was as large as the total number of units which had been formed previously in the whole 4 years of war.

In the matter of personnel, the number of both officers and other ranks has doubled, *the latter being largely drawn from unskilled and partially skilled workers in various metal and engineering trades.*

The increase in the supply of future flying officers is especially striking.

The monthly influx of cadets for training at Cadet Training Wings has increased tenfold, and boys too young for these are admitted to a preparatory training school.

Altogether the number of officers passing through the training squadrons as graduated pilots is more than 200 per cent, greater than it was in January, 1917. This growth in number has been achieved in spite of the fact that the length of time occupied in training has increased.

**The technical and equipment sides of the Corps have shown a similar development, the supply of aeroplanes having been doubled during the first nine months of this year.**

The importance of the work done by the Flying Corps in the field, as the eyes of our Army, can be only faintly imagined from the official communiques. These, however, show that in France, during the period mentioned, 876 enemy machines were brought crashing to the ground, and 759 others driven down out of control by our airmen, apart from invaluable services rendered in bombing the enemy's bases, locating his batteries, and taking photographs of his lines.

Aircraft.

The chief of the new supply functions which have fallen upon the Ministry of Munitions during the period under review is the responsibility for the provision of aircraft, the transfer of which was effected as from the 1st March, 1917.

This involved the absorption of a very large organisation and has resulted in greatly increased output.

It will be remembered that this industry is almost entirely a creation of the war, most of the largest firms with which the Ministry now deals having actually been brought into existence since the outbreak of war, while further important extensions of capacity are now in progress.

Scarcely less pressing was the expansion of aerial warfare, and this led to the second change which finally recognised the status of the new arm by the appointment of the Director of Naval Air Services to a seat on the Board of Admiralty as Fifth Sea Lord.

## Notes on "Civil Aviation"

The Royal Naval Air Service at the outbreak of war possessed a personnel of under 800; at the present moment the numbers approach 46,000 and are continually increasing. Their materiel after the outbreak of war consisted of seven non-rigid airships, considerably less than 100 efficient seaplanes and aeroplanes, and no kite balloons. At the present time there are some 176 airships and kite balloons, well over 2,500 seaplanes and aeroplanes, and a great number of motor boats and subsidiary appliances of all kinds. Attention has been called to the work of the squadrons in Flanders. Mention must also be made of the great value of the air services in combating the submarine menace round our coasts.

Here, again, detailed particulars of the services performed cannot justifiably be given, but as illustrating their extent it may be stated that in one week the aircraft patrol round the British coasts alone flies 30,000 miles. The Royal Naval Air Service during the past year has also rendered much assistance to our armies in Macedonia, Palestine, and East Africa, and squadrons have been attached to our army on the Western Front, where they are believed to have destroyed or driven down out of control nearly 400 enemy machines during the last year. The Commander-in-Chief, Sir Douglas Haig, has borne testimony to their efficiency and gallantry. In other fields of action, the bombing of the Turkish Fleet in the Golden Horn, in July, and the destruction of the bridge at Namur, in September, will be remembered out of innumerable gallant and heroic exploits.

Although now technically a part of the Army, and serving as a unit of the British Expeditionary Force on the Western Front, mention must be made of the Royal Naval Division, who are worthily upholding their tradition of Gallipoli, and are acknowledged to be second to none in the manner in which they carry out the duties and tasks allotted to them.

Lord Curzon had retired from the Presidency upon his becoming a member of the War Cabinet under the Premiership of Mr. Lloyd George, and he was succeeded in January, 1917, by Lord Cowdray.

January 1917 : Lord Cowdray assumes presidency of the Air Board

February 1917 : the Air Board submits a draft of the Charter defining its functions and duties for the approval of the War Cabinet. The Board, after discussion, had settled with the Admiralty and War Office.

1. The Director of Naval Air Services is given a seat on the Board of Admiralty as "Fifth Sea Lord"
2. the Controller of Aeronautical Supplies - Ministry of Munitions is added to the Board
3. the Controller of Petrol Engines - Ministry of Munitions is added to the Board.
4. the supply of all heavier-than-air-craft to both services is transferred to the Ministry of Munitions
5. the supply of all engines for heavier-than-air-craft for both services is transferred to the Ministry of Munitions
6. the supply of all accessories for heavier-than-air-craft for both services is transferred to the Ministry of Munitions
7. the Air Board becomes responsible for design of all heavier-than-air craft
8. the Air Board becomes responsible for design of all engines for heavier-than-air craft,
9. the Air Board becomes responsible for design of all accessories for heavier-than-air craft,
10. the Air Board becomes responsible for the allocation of the aircraft between the two services in accordance with the aerial policies determined by the services in concert with the Air Board.

In February, the Departments of the Controller of Aeronautical Supplies, of the Director-General of Military Aeronautics, and of the Director of Naval Air Services were transferred to the Office of the Air Board.

The various British authorities concerned with aviation were thus for the first time housed under one roof.

Such an arrangement (though subsequent developments have led to the occupation of other adjacent buildings) was clearly of a nature to facilitate the amalgamation not only of the departments of design and supply but also of the combatant services themselves if events proved such a measure to be desirable.

It is now necessary to discuss the factors which led to the transformation of the second Air Board into the fully equipped and independent Ministry which is, at the date of the Report, in course of organisation.

## Notes on "Civil Aviation"

At the time of the formation of the second Air Board, the requirements of the two services in the matter of aircraft were far from satisfied, and during the first six months of its existence the whole of its energies were devoted to increasing supply in order to meet those requirements.

By the middle of the summer of 1917 the situation had improved so much that the Board was in a position not only to look forward to the day when the needs of the two services would have been met but also to anticipate the creation of a substantial surplus of aircraft beyond those needs.

It then became necessary to take measures for the utilisation in the most effective manner of these additional aircraft. This gave rise to questions of policy which the Board, constituted as it was, was unable to solve.

An Air War Staff became a necessity in order to consider problems of aerial offensive and defensive distinct from those connected with the operations of the army and the navy. The need for such a body was pointed to by the obviously increasing importance of these problems. The speed, range and carrying capacity of aircraft were reaching a stage of development almost unsuspected at the beginning of the war. It was possible to envisage from the results of bombing operations already practised on lines of communication and other places behind the enemy's lines the effect which the extension of these operations might have upon the determination of a struggle which, as regards the conflicts of the opposing armies on the western front threatened to reach, if not a deadlock, at all events a condition where victory might only ensue by a long and costly process of attrition.

From the point of view of defence, the "new arm" of the service presented problems pregnant with at least equal importance.

The proud and ancient inviolability of these islands was being challenged in a new and startling fashion, and the seriousness of the problem was added to by the fact that the geographical position of the capital of the Empire rendered it particularly inviting to attack from the air.

The menace of the lighter-than-air craft seemed in a fair way to be overcome, but it was clear that the possibilities of attack by bomb-carrying aeroplanes were not yet either measured or mastered, and any arguments based on the assumption that the uses of aircraft were purely ancillary to military or naval operations were being refuted by the logic of fact and experience. The Air Board, however, possessed neither the staff nor organisation to enable it to cope with these problems.

The President was without that body of technical advice which alone would enable him to form a correct judgment as to the relative importance of the different methods of employing aircraft.

For technical advice of this kind he could look only to the naval and military members of the Board who sat there mainly as representatives of the Board of Admiralty and of the Army Council.

These considerations led to Lord Cowdray's addressing, on July 28th, 1917, to General Smuts (as the member of the War Cabinet charged with the general supervision of air matters) a letter setting forth his view that the Air Board should be turned into a permanent Ministry, that it should have a War Staff to consider the best use to be made of aircraft not needed directly by the operations of the army and the navy, and that the surplus aircraft should be considered a distinct unit from the air contingent attached to the Expeditionary Force.

On August 24th the War Cabinet decided to accept in principle the establishment of an Air Ministry, and also decided that a further Committee should meet at once to work out a "scheme" (Programme) for giving effect to this decision. This body consisted, under the chairmanship of General Smuts, of representatives of the Admiralty, War Office, Treasury and Air Board, and was known as the Air Organisation Committee. Its appointment was a necessary administrative corollary to the decision taken by the War Cabinet on the question of principle. The absorption of the two branches of the air service in a single service would at any time have been a matter of complexity, and the task was one of which the delicacy was enhanced by the fact that it was to be brought about in the middle of a great war and at a time when those concerned in the amalgamation were carrying a burden of responsibility and administrative work, the daily performance of which could suffer no interruption or delay. It was essential, therefore before any legislative action was initiated that the ground to be covered should be carefully plotted out, and this was the task which fell to the Air Organisation Committee.

The nature of its inquiries may be indicated under the following statement of some of the questions which were dealt with :—

1. the legislation needed for the establishment of an Air Force [and of an Air Council to administer it],

## Notes on "Civil Aviation"

2. the constitution of the Air Council, its membership and the appointment of duties between the members,
3. the organisation of the Air Ministry and the duties of Air Ministry officials,
4. the question of supply in all branches, the rates of pay, conditions of service and pension allowances,
5. the relation between the Air Ministry and Air Force and the War Office and Admiralty and Army and Navy,
6. the preparation of King's Regulations and other matters relating to discipline etc.

On the majority of these questions the Air Organisation Committee was able to arrive at an agreement with the departments concerned.

It is, however, only right (if a just perspective is to be maintained) to emphasise the importance of the contribution to the unification of the two services which had been made when their headquarters' staffs became housed under one roof.

The opportunities for daily conference on almost every subject of aeronautical administration which naturally ensued [together with the link provided by a joint system of supply and design] was probably an essential preliminary to the task of unification.

### Ministry of Air.

Following upon the discussions of the Air Organisation Committee,

November 1917 : The Air Force Bill was introduced into the House of Commons.

29 November 1917 : The Air Force Bill meets with no opposition of principle in either House and receives Royal Assent

The "scheme" (Programme) of the Act contemplates that the whole of the personnel and equipment of the R.F.C. and R.N.A.S. *"should be in due course absorbed by the Air Force under the control of an Air Council presided over by a Secretary of State and exercising functions analogous to those of the Army Council".*

It was not necessary to provide the new force with a complete and original code of administration co-extensive with the codes by which the Navy and Army are governed are made up of an accretion of centuries of experience.

The actual administration of the Air Force would clearly offer many analogies to that of the Army.

It was found practicable to adopt with modifications the Army (Discipline) Act to regulate the discipline of the Air Force.

*The Crown is empowered by Section 13 of the Air Force (Constitution) Act "to apply with any necessary modifications to the Air Force any of the various enactments relating to the powers, rights and duties"*

*It was not to be expected that the new department could spring forth fully' armed from the decisions of the Legislature.*

The provisions of the Air Force (Constitution) Act represented the fruits of a careful preliminary exploration by the Air Organisation Committee, but there remained important steps in the detailed organisation of the new Force which could not be undertaken until the Bill became law.

One of the first steps in reorganisation was a readjustment of the positions of

1. the *Technical Department of the Air Board* - responsible for the design of aircraft, and
2. the *Aeronautical Supply Department of the Ministry of Munitions* [under Sir William Weir - also a member of the Air Board]

Changes were made to unify the functions of the two Departments.

22 November 1917 : Lord Cowdray resigns as President of the Air Board.

23 November 1917 : Lord Rothermere appointed President of the Air Board. (FLIGHT 29 Nov. 1918) THE NEW AIR MINISTER : IT was officially announced on November 27th that the King has been pleased to approve of the appointment of Lord Rothermere to be President of the Air Council ; Lord Rothermere, who was Mr. Harold Harmsworth, is a younger brother of Lord Northcliffe; he will be fifty next April. He has built up several large businesses, including some prominent newspapers, such as, the Glasgow Daily Record, the Leeds Mercury, the Daily Mirror and the Sunday Pictorial. He has also been solely or partially concerned in such vast business concerns as the Anglo-Newfoundland Development Co. Lord Rothermere assisted to found the Union Jack Club, of which the usefulness has been fully proved since the war : and he founded the King Edward VII. Chair of English, Literature in the University of Cambridge—at present occupied by Sir Arthur Quiller-Couch. His first step in public service was his appointment as Director of the Army Clothing Department when grave deficiencies had been discovered, in that quarter, and his new appointment is doubtless partly in recognition of his success in reorganising the department. Lord

## Notes on “Civil Aviation”

Rothermere has suffered personally in the war. His second son died most gallantly while leading his men against the enemy a year ago. His elder son and heir has been twice wounded, and is at present serving at the front; and his third son, on leaving Eton, has joined the Royal Marines.

29 November 1917: Promotion for Second Lieutenants. AN Army Council instruction has now been issued embodying the decision that all 2nd Lieuts., if duly recommended, shall be eligible for promotion to the rank of lieutenant on completion of 18 months' commissioned service, if they have not previously been promoted to fill a vacancy. It will rest now and in the future with the commanding officer to recommend officers who have completed the qualifying period.

21 December 1917 : Order in Council issued to set up the Air Council

02 January 1918 : Order in Council issued to define the duties of the Air Council members and appoint members:

1. Secretary of State for Air - Lord Rothermere
2. Parliamentary Under-Secretary of State - Major J. L. Baird, C.M.G., D.S.O., M.P.
3. Vice-President - Lieutenant-General Sir David Henderson, K.C.B.
4. Chief of the “Air Staff” - Major-General Sir Hugh Trenchard, K.C.B.
5. Deputy-Chief of the “Air Staff” - Rear-Admiral Mark Kerr, C.B.
6. Master-General of Personnel - Commodore Godfrey Paine, C.B.
7. Comptroller-General of Equipment - Major-General W. S. Brancker
8. Director-General of Aircraft Production in the Ministry of Munitions - Sir William Weir ;
9. Administrator of Works and Buildings - Sir John Hunter, K.B.E.

The Air Council is now engaged [in consultation with the Admiralty and the War Office and other Departments concerned] in completing arrangements preparatory to the assumption of full administrative and executive responsibilities.

Two matters in which some misunderstanding may have existed as to “the seat of responsibility” for home defence :—

(1) Home defence against air raids is under the control of the Field-Marshal Commanding the Home Forces. Aircraft, anti-aircraft guns and searchlights for the defence of London have been united under the immediate command of a single General Officer. Elsewhere in the United Kingdom the guns and lights are under the local General Officer Commanding-in-Chief. As such, the Air Council is not responsible for Home defence against air raids

(2) The control of lighter-than-air craft for Home defence - has been grouped under the General Officer Commanding a Brigade. Section 3 of the Air Force Constitution Act, however, provides that “units of the naval or military forces engaged in *defence against aircraft* may [by arrangement with the Admiralty or Army Council] be attached to the “*Air Force*” -This refers mainly to aeroplanes and seaplanes. Airships, and to a lesser extent, the kite balloon have been administered on somewhat different lines.

Up to 30 December, 1912 : The British Army and Navy are both experimenting with airships.

30 December, 1912 : the Army Council relinquishes “experimenting with airships” to the Navy.

1st January 1913 : British Army airships and personnel are transferred to the Admiralty.

1st January 1913 : From this date onwards, airships are experimented with and administered solely by the Admiralty.

At the outbreak of war there were only five small airships in existence [in England] and little progress was made [in airship design / construction / operation] until March, 1915.

March, 1915 : the first S.S. (Submarine Scout) type airship is produced and a programme embarked upon.

March 1915 : Beginning in March, considerable airship development takes place.

1. Non-rigid airships form an important part of anti-submarine measures, but have a limited range of action.
2. Rigid airships are constructed by the Admiralty with a much wider range of action.

On the formation of the Air Force in 1918, though the principle was agreed to that ultimately airships should be transferred to the new authority, it was decided that until this branch of the service had become settled on a more solid foundation the responsibility

## Notes on "Civil Aviation"

for the design, production and administration should remain with the Admiralty. The personnel will be transferred to the Air Force while remaining with the Admiralty for production and administrative purposes.

The kite balloon was originally taken up by the Navy in March, 1915, and their example was followed by the Army, whose first three land sections in France were manned by naval personnel.

It was later arranged that the second Air Board should be responsible for the whole of the supply of E.F.C. requirements, though

the Admiralty remained responsible for the provision of a considerable portion of the demands for naval kite balloons. On the formation of the Air Force the whole responsibility for kite balloons will pass to the new ^ body.

Reference should be made to some of the organisations subsidiary to the central authority whose evolution has been traced in the preceding paragraphs.

Inventions.—The administrative separation of the two branches of the service reflected itself in the arrangements for dealing with

aeronautical inventions, the consideration of which was divided between the Board of Invention and Eesearch under the Admiralty, the Munitions Inventions Department under the Ministry of Munitions, and the Directorate of Military Aeronautics "under the War Office. This division of responsibility possessed obvious disadvantages in a matter where the co-ordination . of all sources of knowledge and experiment was of prime importance, and one of the duties with which the first Air Board was charged was the organisation of a system of further interchange of ideas on air problems between the two services.

Proposals

to this ead were put forward by Lord Curzon without securing acceptance from some of the parties whose concurrence was essential, and a settlement of the problem was not reached until the middle of 1917, when an Air Inventions Committee was

appointed by Lord Cowdray, to which was transferred all duties in connection with the examination of inventions relating to heavier-than-air craft. This Committee works in close cooperation with the Advisory Committee on Aeronautics.

Civil Aviation.

A Committee known as the Civil Aerial Transport Committee was appointed in April, 1917, under the chairmanship of Lord Northcliffe to consider :

- (1) " The steps which should be taken with a view to the development and regulation, after the war, of aviation for civil and commercial purposes, from a domestic, an Imperial, and an international standpoint.
- (2) " The extent to which it will be possible to utilise for the above purposes the trained personnel and the aircraft which the conclusion of peace may leave surplus to the requirements of the naval and military air services of the United Kingdom and Overseas Dominions."

The Committee at the outset divided its enquiry into five branches and entrusted each to a special committee, as follows :-

- (1) Questions of law and policy.
- (2) Technical questions as to the performance of aircraft and the requirements of aerial services.
- (3) Business questions relating to the position of the aircraft manufacturing industry after the war.
- (4) Labour questions.
- (5) Problems of research and education.

Reports by all the five Sub-Committees have been drawn up and are now under consideration by the Main Committee.

Medical Research.—A Medical Eesearch Committee appointed in March, 1917, has performed valuable services to the investigation

of the various physiological phenomena produced by flying at high altitudes and kindred subjects. It has been found by experience that flying men are subject to many peculiar disabilities, and considerable progress has been made in the methods of prevention and cure of these disabilities.

\*\*\*\*\* Supply of Aircraft.

The above recital indicates generally what steps have been taken in matters of administration and control. It should be supplemented by some general account of the measures taken aa regards supply of aircraft and the development of that supply.

## Notes on "Civil Aviation"

In endeavouring to describe the measures taken to meet the aircraft needs of the Navy and Army, the writer is at once confronted by the fact that the information desired by the country is precisely the information desired by the enemy. What the country wants to know is what has been the expansion in our Air Services ; whether we have met and are meeting all the demands of the Navy and of the Army, both for replacement of obsolete machines by the most modern types and for the increase of our fighting strength in the air ; what proportion of the national resources in men, material and factories is being devoted to aviation ; what the expansion is likely to be in the future. These are precisely the facts which we should like to know with regard to the German air service, and for that reason it would be inadmissible for us to supply Germany with corresponding information about ourselves by publishing a statement on the subject. It can be said that the expansion of our Air Services is keeping pace generally with the growing needs of the Navy and the Army.

The brilliant part played by the Royal Flying Corps and the Royal Naval Air Service in the battles of the Somme, Vimy, Messines and Ypres has been described by the Commander-in-Chief, who has also borne frequent testimony to the inestimable value of the work performed daily and nightly by the two air services. It is fair to say that not even the well-known superiority of our airmen over those of the enemy would have enabled them to have earned the Commander-in-Chief's praise in so unstinted a measure unless they had been supplied with satisfactory machines and equipment from home. It is rather the fashion to criticise the quality of our machines. Most of the critics, however, are ignorant of the technical and manufacturing difficulties which have to be overcome in order to keep up a constant and increasing supply of the most up-to-date machines. Not only are the technical difficulties and the resultant research and experimental work formidable in themselves, but the task of building up in war time, without seriously affecting the requirements of other services, a new industry of a most highly skilled character necessarily puts a heavy strain upon the organising and manufacturing ability of the country. The growing realisation of the increasing importance of aviation as an artificer of victory has recently been reflected by the concession of first priority to labour and materials required for aircraft production.

The nature of the duties performed by the Royal Naval Air Service, both in conjunction with the fleet and from naval bases, makes secrecy essential to success. It is, unfortunately, inevitable, therefore, that the public should remain in the dark on this subject; but the Germans, who in this matter are perhaps the best judges, have good reason to know and to regret the great and growing activities of the Royal Naval Air Service. All that has been said regarding the difficulties of supplying the requirements of the Air Forces operating over the land applies equally to the supply of those which operate over the sea. In both cases difficulties are being overcome and the outlook is improving.

The science of aeronautics is in a state of constant and rapid development; improvements in engines, aeroplanes and their numerous accessories are constantly being worked out. But the interval between the discovery of an improvement and its introduction into the service is, owing to technical considerations, very much longer than is commonly supposed. Experience shows that, as a rule, from the date of the conception and design of an aero-engine to the delivery of the first engine in series by the manufacturer, more than a year elapses ; the corresponding period for an aeroplane is about one half as long.

Consequently, plans have to be laid for a long period ahead, and these plans are liable to be upset by many uncertain factors.

- I. The hopes based upon the promising results given by the first experimental engines of a new design are frequently disappointed owing to difficulties of bulk manufacture or to defects only developed after long trial in the air ;
- II. new types of aeroplanes favourably reported on when first tried are found on longer experience not to give complete satisfaction, and yet it is impossible, if we are to keep ahead in the keen struggle for aerial superiority, to wait for full experience before placing orders.
- III. Risks must be run, and new types must be adopted at the earliest moment consistent with reasonable assurance that they will constitute a substantial improvement on what is already in use.
- IV. Orders must be placed, moreover, for considerable numbers and for delivery over many months, as the large output required for our present flying services can only be obtained by bulk orders permitting a high degree of sub-division of work.

The next step in the problem is the balancing of the engine and the aeroplane programmes.

## Notes on "Civil Aviation"

Owing to the much longer period required for the production of engines than of aeroplanes, orders for the former must be placed for relatively long periods ahead, before it is known what types of aeroplanes will be required when the engines become available.

The problem is complicated by the fact that manufacture and delivery rarely if ever proceed in accordance with anticipation.

The output of a particular type may be delayed for weeks or even months owing to some technical difficulty of manufacture. Moreover, as replacement of losses and expansion are proceeding simultaneously in the flying services, and the rate of wastage in different types of engines and of aeroplanes varies considerably according to circumstances, it is impossible to forecast with accuracy what engines will be available for the equipment of new types of aeroplanes after wastage has been made good. Nor is it possible to any great extent to adjust the programme by modifying orders once placed without disorganising supply.

The problem does not end here. Whenever a new type is introduced provision must be made for accumulating a sufficient "head" of spare engines, spare aeroplanes and spare parts of innumerable kinds, to keep the squadron to be equipped with that type in a condition to make good the day-to-day wastage and carry out the constant repairs required.

Such being the nature of the problem, it is satisfactory to be able to record that during the year 1917 not only was the number of squadrons of aircraft on the various fronts increased in a notable degree, but there was a complete replacement of machines and engines of the older types. The very great increase in output which is being obtained has placed a considerable strain on the workers in the aircraft and aero-engine factories of the country, a strain which is being met on the whole in a satisfactory manner.

The difficulties in connection with production are aggravated by the competing claims of many different types of aero-engines. Standardisation is the ideal but it is obviously difficult of attainment having in view the importance of not losing time in production and at the same time of keeping abreast with the very latest developments necessitated by the need for constant increase of horse-power and higher performance.

The Air Council are most keenly impressed by the need for concentration on a few approved engines, and they have the whole question of the reduction of numbers of types under constant and careful consideration.

Attention was drawn, on more than one occasion, by manufacturers to the importance of maintaining the interest of workers in aircraft factories in the highly important but generally monotonous work on which they are employed.

Engaged, as they frequently are, on the production by a repetition process of some small part of an aeroplane, these men and women find it difficult to realise that they are contributing effectively to one of our most valuable instruments of warfare.

It was accordingly arranged that Captain Ewart, E.F.A., well known as a writer by the name of "Boyd Cable," should visit various squadrons at the front and gather materials and photographs for lectures concerning the exploits performed with various types of aircraft for delivery to the workpeople engaged on the manufacture of those particular types. Captain Ewart delivered several series of lectures which, judging from the reports received from the factories concerned, proved a very great success.

### Ministry of Munition - I.

#### Administration,

The Act establishing the Ministry of Munitions was passed on June 9th, 1915, and special powers were conferred upon the Minister of Munitions by an Order in Council dated 16th June, 1915, the Munitions of War Act, 1915, and subsequent Acts and the Defence of the Realm Acts.

Mr. Lloyd George took up his work as Minister of Munitions on May 26th, 1915, the nucleus of the new Department being formed by the Staff of the Cabinet Committee on Munitions, together with that of the special organisation established at the War Office under Lord Kitchener for the development of munition supply, known as the Armaments Output Committee.

To these were rapidly added certain older sections of the War Office organisation, such as:

1. the branch dealing with contracts for warlike stores and
2. Lord Moulton's Committee for the production of high explosives.

## Notes on "Civil Aviation"

This process of transfer from the War Office was carried further in latter months, and by the end of 1915 the scope of the Department covered the supply of :

1. Arms,
2. Ammunition,
3. Explosives,
4. Optical Munitions,
5. Materials,
6. Trench Warfare Supplies,
7. Munitions Contracts,
8. Munitions Finance,
9. Inspection,
10. Invention,
11. Design and the Administration of the Royal Ordnance Factories,

these functions being in the main duties which had formerly been exercised by the War Office.

During 1916 the Ministry of Munitions was entrusted with further responsibility for:

1. the storage of Gun Ammunition,
2. Supply of Tanks,
3. Supply of Tractors for Heavy Howitzers,
4. Supply of Railway Materials for the Army,
5. Supply of Mechanical Transport Vehicles, and
6. the Supply of Chemical Glass and Laboratory Ware.

Since December, 1916, these functions have been further extended to include the highly important department in charge of the supply of heavier-than-air Aircraft for both Land and Naval services, as well as the development of Agricultural Machinery Supply on behalf of the Board of Agriculture.

Since June, 1917, the Ministry of Munitions has also been responsible for the Supply of Fuel Oils.

" THE WAR CABINET REPORT FOR THE YEAR 1917 - Presented to Parliament by Command of His Majesty. H.M. STATIONERY OFFICE at the following address:  
Imperial House, Kingsway, London, W.C.2, Printed under the authority of His Majesty's Stationery Office  
By DARLING and SON, Limited, Bacon Street, E.2= Cd. 9005.] 1918.

29 November 1917 : FLIGHT : Promotion for Second Lieutenants.

*AN Army Council instruction has now been issued embodying the decision that all 2nd Lieuts., if duly recommended, shall be eligible for promotion to the rank of lieutenant on completion of 18 months' commissioned service, if they have not previously been promoted to fill a vacancy. It will rest now and in the future with the commanding officer to recommend officers who have completed the qualifying period.*

The King at the N.P.L. A BUSY morning was spent by H.M. the King on November 23rd at the National Physical Laboratory, Teddington, and the instructional workshop in the Twickenham district. It was explained to the King that the workshop had been established to meet the serious shortage of suitable labour for the requirements of engineering firms for work of high standard, principally the construction of aeroplane engines.

They were most successfully training, in a very short time, highly specialised workers.

Aeroplane engines, in various stages of completion, were examined by the King, who took great interest in the measures taken to ensure dead accuracy.

In spite of the difficulties it had been found possible to teach girls to make and gauge important parts of aeroplanes to the thousandth of an inch.

At the N.P.L. the King, who opened the Laboratory in 1902, was received by the Director, Sir R. T. Glazebrook. His Majesty saw aeroplane parts being tested in the wind channel and witnessed the delicate operation of gauging the gauges. Towards the end of the visit the King was shown three similar looking bars of metal, one of ordinary steel, another of aluminium and a third of a new and secret alloy. The third was not much more than a featherweight in comparison with the first, and it was explained that by a series of exhaustive tests and experiments an extraordinarily light metal had been produced which, in many of its attributes, was equal to the finest steel.

## Notes on “Civil Aviation”

end of 1917 : American built DH-4s with Liberty engines flying regularly above Dayton Ohio ; a few months later they were have been crated and are in transit to European airfields for action alongside the already battle hardened fleets of Spads, Sopwith Camels, and Nieuports however Liberty-powered DH-4 had no major roles in winning the war<sup>101</sup>

<sup>101</sup> ENGINEER IN CHARGE - pg 19

**CANADIAN AVIATION - 1918**

1918 : Women over 30 gain the right vote in the British Empire.

02 January 1918 : the Air Board (UK) is reconstituted as Independent Air Ministry created within British Ministry of Defence (MOD). The new Air Ministry is lead by Lord Rothermere.  
Offices were still located in the Hotel Cecil until the new Air Ministry was transferred to its new permanent office at Adastral House in the Kingsway, London.

January 1918 - Sir Hugh's successor was an officer whom the R.F.C. knew, and whom they trusted as they trusted General Trenchard himself. Major-General J. M. "Jack" Salmond, in France, and had seen his work as a Squadron- Commander, as a Wing-Commander, and as a Brigade Commander.

The younger generation knew him as G.O.C. the Training Division at home, an officer who had organised a system of training which gave a young pilot more military training and many times more hours in the air in six months than had been possible under the old system in a year.

Major-General Sir Hugh Trenchard is made Chief of Air Staff. Trenchard resigns on 13 April 1918.

January 1918 : RNAS ends Canadian recruiting, some **635 men were raised**. See more at: <https://legionmagazine.com/en/2015/06/canadian-flyers-go-to-war/#sthash.Nujh0vay.dpuf>

? 1918 : UK Government appointed "Civil Aerial Transport Committee" recommends subsidies to ensure the success of British "Civilian" aviation post WW1.

American Billy Mitchell : commands the American Air Service in France in 1918. Mitchell meets and is impressed by Trenchard. Mitchell returned to America to preach Trenchard's doctrine "independence of air power" in the 1920s.

spring of 1918 : the government of Prime Minister Robert Borden presses for the development of a Canadian "air wing", consisting of eight squadrons, for service with the Canadian Corps in France.

1917-1918 : 7,453 mechanics recruited in Canada for RFC / RAF. There was no air recruiting office in the Department of Militia, but British officers on the Governor General's staff found numerous young men volunteering to join the flying services - See more at: <https://legionmagazine.com/en/2015/06/canadian-flyers-go-to-war/#sthash.dOC4VryN.dpuf>

9 January 1918 : Frank Wilton Baillie knighted "Order of the British Empire" (OBE), the first Canadian to receive this honour. OBE was created to recognize service in WW1.

January 1918 : The UK Air Ministry formed "to cater for all aviation interests", Service and Civil(ian)

January 1918 : the UK Advisory Committee for Aeronautics (on which the USA's "NACA" had been modelled) becomes the "Aeronautics Research Committee" (& shorn of much of its power, independence and drained of funds is then) and placed under jurisdiction of the Aircraft Factory -

1918 : 5 German submarines are known to operate off Canada's East Coast. flying-boat stations were established at Dartmouth and Sydney, N.S. The aircraft and personnel were members of the United States Navy, but it was intended that a Royal Canadian Naval Air Service (RCNAS) would take over. The service was authorized on Sept. 5, 1918, and started recruiting and training ground technical personnel, but with the armistice on Nov. 11, 1918, the RCNAS was promptly disbanded - See more at: <https://legionmagazine.com/en/2015/06/canadian-flyers-go-to-war/#sthash.Nujh0vay.dpuf>

1918: Lieutenant-General Sir Richard Turner, commander of Canadian forces in England, had picked up on Borden's idea of a Canadian Flying Corps. He was supported by Sir George Perley, Canadian High Commissioner to the United Kingdom, in lobbying for such a body.

## Notes on “Civil Aviation”

17 February 1919 : AERIAL NAVIGATION BILL : HC Deb Imperial Parliament - London, England vol 112 cc666-87  
666

§

Order for Second Reading read.

§

The UNDER-SECRETARY of STATE for AIR (General Seely) :

it is a temporary measure, we have asked the House to pass this Bill is that unless we get legislation of this kind it is impossible to permit civilian flying at all, We are advised by the Law Officers of the Crown that we have not the power in the Air Ministry to make Regulations for civilian flying without legislation. this Bill to the House as being necessary in order to enable the science of flying to be pursued other than by the military.

The Bill provides that the Secretary of State shall have power to make certain Regulations, and, in order to forestall criticism of those Regulations, I would say that the object of them is solely to secure the reasonable safety of the public.

We have no desire to impose upon civilian flying any restrictions which would in any way tend to prevent people from evolving new types or doing anything which they think will advance flying.

But, of course, it is necessary to have power to secure the safety of the public, and this we shall obtain by the provisions of the Bill. The reason why this is only a temporary measure, and why it is proposed only to take power to act under it until the first day of next year, is that it will be necessary later in the Session, by permission of the House, to introduce a larger Act regularising flying in accordance with the provisions of a Convention, which we hope will be agreed to by the Allied Powers, at a Convention which will shortly meet in Paris.

We have already made considerable progress in agreement with France, America, and other Allied nations, and I trust we shall come to a general agreement as to the regulation of flying.

This will then be embodied in a Bill which I shall ask leave to bring before the House. In the meantime, this Bill will enable us to give permission to civilians again to commence to fly. I earnestly hope it may have a quick passage through the House, for he would be a rash man who set any limit to the possibilities of flying in the future; and the sooner we permit those who are interested in it to fly, under proper safeguards for the public safety, I think the better for all concerned.

Rebuttal by Mr. JOYNSON-HICKS : I would like to point out to the House that for the first time, new Regulations are going to be brought forward dealing with civilian flying of possibly the most far-reaching character. The Regulations that are going to be made by my right hon Friend at the present moment, though only temporary, will probably form the foundation of the subsequent Regulations or of the Bill which he propose to introduce later on.

19 March 1918 : Hugh Trenchard resigns from UK Air Ministry after Lord Rothermere lies to the RNAS about delivery of 4000 new aeroplanes which did not exist. I do want to pro-test against this form of legislation—because it is really legislation—being carried out at the whim of the Secretary of State [...] he simply introduces an enabling measure to enable himself or the Secretary of State for Air to make any kind of regulations he thinks fit, and those regulations will be in force for a year, and probably form the basis of future legislation. These regulations are bound to interfere with the liberty of the subject in every possible way. They are bound to deal with registration, and the grant and suspension of licences for flying. As my right hon. Friend knows, prior to the War, no licence was required. The old Acts of 1911 and 1913, whose rights are carefully preserved, were merely Acts enabling the Secretary of State to prescribe certain areas over which flying should not take place [...]. I do not know whether the House is aware that there has been sitting a very strong Committee, which has drawn up a model Bill. Probably my right hon. Friend has that Bill and knows the contents of it. The House, however, does not know it. It was the strongest Committee—although I was a humble member myself—I ever sat upon. Representatives of the War Office, Navy, Air, Foreign Office, Treasury, Home Office, Board of Trade and His Majesty's Customs, were upon it. In addition, there were some flying men and some lawyers. The whole question of the regulation of flying in this country was gone into, and a most elaborate Bill was drawn up. I think we sat for over a year dealing with this measure, which, I venture to say, could be brought into the House and carried almost in a single sitting. It was completely accurate in all its details. Instead of adopting that, however, my right hon. Friend comes forward and asks us to give him, or his Secretary of State, the right to make any kind of regulation he thinks fit. [...] Although my right hon. Friend has disarmed me by his statement as to the temporary character of his Bill, there are one or two questions I want to ask him as to the regulations he is going to make, more particularly with regard to flying over other people's property. While it may be perfectly right for Parliament itself to take away the right of a man to prevent flying over his own property, I suggest it is not right and proper to leave those rights merely in the hands of a Secretary of State. What provision is he going to make? At the present moment I very gravely doubt whether, by an Order made under this Bill, it would be possible for the Secretary of State to take away the right of any man to prevent flying over his own land. Of course that matter must be dealt with. At the moment the law undoubtedly is—I do not want to press the legal point of view—but the position undoubtedly is that a man who owns a piece of land or house owns

## Notes on "Civil Aviation"

the air above it right up to the sky. [Hon. Members: "No!"] I am very sorry there are any hon. Members who do not know the law. I thought all Members of Parliament would have known that. That has got to be dealt with, and it is desirable that it should be dealt with, because we could not have one eccentric owner of a particular piece of land, which might be under an aerial highway, stopping flying over it. But is my right hon. Friend proposing to deal with that by regulation under his Bill? If so, I suggest he should consult the Law Officers of the Crown as to whether it would be possible to deal with that by mere regulation under the Bill. Then what is my right hon. Friend going to do about territorial waters, or what one might now call territorial air? He preserves in his Bill territorial rights, but a three-mile limit is no earthly good in regard to the air. [...] He takes power under the Bill to provide for "the registration, identification, inspection and certification of aircraft." My right hon. Friend, by regulations, is going to take upon himself the certification of every aircraft which is allowed to fly in this country. He knows that an aeroplane may be certified to-day and may be quite unfit for use to-morrow, and yet that aeroplane is to be let loose with a Government certificate, which any passenger who chooses to go in the aeroplane is bound to treat as an official certification of its air-worthiness [...] I venture to suggest my right hon. Friend should consult the proposals of the committee to which I have referred, which suggested that merely the type of aircraft should be certified as being an air-worthy type, and that it would be quite out of the question to attempt to deal with the certification of the air-worthiness of any individual machine. Then, of course, the same thing applies to "the licensing, inspection and regulation of aerodromes". Is he going to give a certificate with regard to every aerodrome that is perfectly safe, because that, I take it, is what certification means. When I was on another Committee on the Air Force a little time ago we came across certain aerodromes which the Committee unanimously condemned as unsafe, but of which the military authorities felt bound to continue the use. Naturally at that time, during the War, we civilian members of the Committee could not possibly protest, but there are aerodromes to-day in this country which are not safe for ordinary purposes, and I think my right hon. Friend must take very great care as to what steps he is going to take about certifying certain individual aerodromes. The last point I am going to ask is this: What steps is he going to take by his regulations, or otherwise, in regard to the question of damage by aeroplane accident? Suppose, for instance, an aeroplane comes into collision with another aeroplane and both men are killed, there is no possibility of finding out who is at fault. The machine drops and kills someone on the King's highway, or does damage to one of His Majesty's subjects. At the present moment everybody knows that if damage occurs on the highway from a motor car or ordinary vehicle, the injured person has to prove there was negligence. I do not know whether that is going to be the case in regard to aircraft. It is a very serious question indeed. That Committee, to which I have referred, reported that, in their opinion, an aeroplane should be treated as liable for all damage it creates, and that it should not be necessary for anybody to prove, or attempt to prove, negligence, because it would be impossible. I have no doubt that my right hon. Friend has considered these points in the regulations he proposes to make, but before the House parts with the Bill I think I may be entitled to say, for the benefit of the newer Members, that the Clause in the Bill which says that the regulations shall lay for twenty-one days on the Table of the House, during which time an Address may be presented to His Majesty, is a mere farce. There is no real possibility, as my right hon. Friend knows, of objecting to these things laid on the Table of the House, simply because one can never get the time of the House in order to do it. Therefore, before parting with the Bill, I ask my right hon. Friend to be a little more explicit and give us a little more information on the points I have raised.

Comment by Mr. MOSLEY : I must crave the indulgence of the House this evening not only on the usual account of a maiden speech, but I must ask it to condone in me that very serious offence which the great Chatham once described in this House as "the atrocious crime of being a young man." That dictum from the mighty past weighs rather heavily upon me this evening from the consciousness that I am to-day the youngest Member of this Assembly. The House, however, is considering a subject which, I think, we may claim as belonging principally to the youth of to-day, but, we may say with some confidence, to all generations of the future. I have not that experience which is possessed by some other hon. and gallant Members in this House; in fact, my total experience of flying amounted only to about a year, and I must confess, like thousands of others, that my brief contact with the air, and, on one occasion, at least, with her sister element the earth, left a rather more decided mark upon my body than my activity imprinted on the development of aviation. As one, however, who has an undoubted belief in the potential aerial supremacy of our country, I feel impelled this evening to draw attention to the greatest pitfall which could lower us from our present undoubted superiority in the air.

The war-time epidemic of bureaucratic control has had this nation in its grip for a long time past, and we may deduce from the Bill that we stand in very grave danger of its paralysing influence being extended to embrace the youngest child of the British public, our newly-found Air Force. It is universally admitted, I believe, to-day, that State control is beneficial in some spheres where the free play of individual competition and interest may jeopardise the safety and comfort of the community as a whole, but my contention is that the air is the very last conceivable sphere of human activity to be brought too closely beneath the eye of the clerk in Whitehall. We find in this Bill the very ominous phrase, "Inspection and certification of aircraft." There is a shrewd suspicion in the mind of the trade concerned, that inspection infers the arbitrary right of the State to supervise and intervene at every step of the daily business of the private exploiter of aviation. Surely the easiest and most effective means to the attainment of the desired end—the safety of the public—would be the imposition of the very heaviest penalties in any case of accident which could be attributed to negligence. This, of course, would not only prove less irksome to the private exploiter of aviation, but would actually contribute a greater guarantee to the public that every precaution had been taken. By adopting this course the Government would lay the whole onus of responsibility for public safety upon the shoulders of the company, who would naturally take every step to

## Notes on "Civil Aviation"

see that their own staff was kept at a proper state of efficiency, rather than run the risk of mishap, which would not only ruin their business, but actually curtail the liberty of those responsible.

If the Government undertake the work of supervision, little or no blame can be laid at the door of the company should anything go wrong. I am confident that the public would prefer to repose its safety upon the thoroughness and reliability of the work of the man with a halter around his neck in the shape of heavy penalties if anything go wrong than entrust their person to the tender care of some Government official or inspector who works upon the time system. All new types admittedly must be tested by the Government before being released for the purpose of public conveyance, but if this word "certification" imply any desire on the part of the Government to confine firms engaged in this work to any particular officially approved design. I am confident that the restriction will strike a very severe blow indeed at the industry of aerial manufacture in this country. Imagine in a few years' time some enterprising manufacturer introducing a novel design to the Government Department. Consider the hunt that would ensue through dusty tomes for precedents, and the abrupt refusal when it was discovered that no analogous type has been used in the great War.

Perhaps I exaggerate, but I am confident that many Members of this House will agree with the view that officialdom seldom approaches a novelty with any great predisposition in its favour. I have no very great knowledge of technique, but those who possess that knowledge inform me that it is quite possible that the distance covered by aerial progress in the next decade may be commensurate with that traversed in the last. Surely that ought to open a whole new vista of the utmost development. If one, however, may judge our expectations from officialdom in the future in the light of past kindnesses received from the same quarter, then British manufacturers will embark upon this great new stage in their business with a millstone round their necks. No great exercise of the imaginative faculty should be required to foresee the day when the aviation tank and the aeroplane will have driven the Infantry and other similar units from the battlefield, whilst the furious speed and mobility of the aerially-armed plane, with a weight-lifting capacity which will enable it to carry heavy armaments, will have banished the battleship and the merchant ship from the ocean. If this view be correct—and it is widely believed I understand amongst people who should know—our official perspective in regard to aerial matters appears to be somewhat deficient. In fact, the suggestion that the present position of the air and the War Department should be reversed appeals to be not wholly outside the realms of humour.

In his speech on the Address the right hon. Gentleman the Secretary of State for War (Mr. Churchill) told the British public not to be led into too extravagant expectations in regard to the future of the air. As I have explained already, my political memory is not long, but I have always been led to believe, in fact I have almost been brought up on the idea, that what the right hon. Gentleman suffered from was a paucity of that invaluable political asset called imagination. On this occasion, however, I must warn him that predecessors of his at the War Office fell into exactly the same error, in refusing to credit the possibilities of such rapid extension of the activities of aircraft as we have seen. That regrettable occurrence was described by my right hon. Friend the Member for Chatham (Lieut.-Col. Moore-Brabazon) in his speech on the same day. It was only one of a series of incidents of this nature. In fact, at every step of aerial development that Cerberus at the gate of progress, Officialdom, has refused to credit the possibility of the next step. The development of this great new sphere of our ascendancy, which admittedly contributed largely to the recent glorious termination of hostilities, was achieved almost entirely by individual effort and sacrifice, in the face of an official lethargy and passive opposition which have seldom been rivalled even in the long record of these things which stand to the credit of British bureaucracy.

In dealing with this great problem success may mean the greatest tribute that has yet fallen to British initiative and energy, while one failure will in all probability mean the hot surrender of that hard-won commercial supremacy of the race, the fruit of centuries of individual effort and enterprise. Let us always, then, remember the empiricism of British bureaucracy, which has invariably been failure, and that British individualism has frequently pulled success through. Our Colonial Empire stands a glorious memorial of British individualism, and by no means one of State intervention. The peculiar genius of our race has always manifested itself in strange new enterprises where the individual stood alone, uninspired save by a spirit of adventure in entering new realms and ranges of human activity. In fact, we may say that from the days when Queen Elizabeth refused to countenance the adventurous schemes of Drake, down to the comparatively recent struggle to impress upon the official mind the supreme importance and immeasurable possibilities of aviation, our history has been one long story of individual enterprise and success surmounting every obstacle thrown in its path by official ignorance and apathy. I venture this evening to suggest, with all respect to the Government, that they should safeguard the public in every possible way by the imposition of the most stringent penalties in cases of proved negligence; that they experiment in matters of design by means of that very excellent staff and machinery which they now possess; but that, above all, they allow full play, without irksome or unnecessary restrictions, to that supreme manifestation of the genius of our race—individual initiative and enterprise—which has so frequently proved successful, while, on the other hand, the activities or in activities of State authority have proved a lamentable failure. I appeal to the right hon. Gentleman to allow the private manufacturer to look to the Government for protection and inspiration rather than for restriction and oppression.

Sir F. FLANNERY : The House is to be congratulated upon the accession of the hon. Member for Harrow, and upon the  
675

fresh and fluent contribution that he has made to the Debate to-night, with the suggestion in it of the contributions he will make to future Debates. I should not have ventured to speak, certainly not from the standpoint of my hon. Friend, who is the youngest Member, while I am sorry I am amongst the older Members of the House, but that I desire to speak from the standpoint of one

who has been engaged during the War in the manufacture of aeroplanes, and who has all his life had to do with exact forms of Government inspection and Government interference, so-called, which is set forth in the Bill, and to which the hon. Member for Harrow appears to have a rooted objection. No one, so far as I have heard, has yet referred to the fact that the general provisions of this Bill are identical with the existing provisions and experience of some generations now of the relationship of the Government of the manufacture and carrying on of navigation by sea, and travelling by railway and railroad on land. No omnibus can run the streets of London without having had a certain amount of Government inspection and Government certification. No passenger ship, in fact no ship of any kind, can navigate the sea without having passed the inspection of a Government officer in respect to its safety so far as foresight and skill can secure it for those who will take passage in such ship. No railway train can possibly start, even with the hon. Member who has spoken on board, without every precaution having been taken by signals, and in the construction of the locomotive and coaches under Government inspection, for the purpose of ensuring the safety of the passengers. Is it then to be suggested that with all those precedents and all that experience of these precautions and the safety which has arisen from them, and which is well known, notwithstanding disadvantages—which I admit—that this new and extremely dangerous type of navigation in the air is to be set at large without any precaution by way of Government inspection to secure the public safety? I venture to say that the Government would be criminally and morally responsible for the many lives that were at stake if we were to adopt such a principle as that which my hon. Friend has risen to advocate. I sincerely hope that the Government will, of course, agree to Amendments which will be moved in Com-

676

mittee, but I trust they will stick to the general principle of the Bill, and will see that proper precautions by way of inspection and certification, the testing of materials, and the examination of designs will be undertaken. I do ask my right hon. Friend to take this from me, as one having life-long experience in the matter, that he should do everything in his power to prevent the strangling of improvements which at one time so discredited the Board of Trade in their system of inspection, both as regards railways and steamships. There was a period, thirty-five years or so ago, when no improvements, however obvious, however well-vouched for, would be considered by the Board of Trade until, in some illicit way, such improvement had been tried and had been demonstrated to be satisfactory. When this Bill becomes an Act let such organisation as my right hon. Friend will, I hope, establish be guided by the highest possible and the most progressive scientific men that he can find. Let there be an experimental department if necessary. Let the Government officials not be obstructionists, but lead in the van of progress and encourage rather than obstruct. Having done that, having put their imprimatur upon that which is safe and their ban upon that which is unsafe, they will contribute to progress, and ensure the safety of those who will travel by what, I believe, will be one of the regular sources of transit in the immediate future.

Lieut.-Colonel MOOREBRABAZON I apologise for again troubling the House so soon after my recent speech, and I have been told that it is not a very proper proceeding. However, I would not like this opportunity to go by without saying one or two words upon this Bill. Aviation may be divided under two heads, military and commercial. The other night we discussed a little the military side of it, and the Prime Minister, I regret to say, has caused a very excellent Minister, the right hon. Gentleman the Member for Dundee (Mr. Churchill), to lead a double life, for he is not only Secretary of State for Air, but he is also Secretary of State for War. To-night we are looking upon this subject more from the commercial side rather than from the military point of view. We welcome any Bill and will help any Bill such as this which does allow civilian flying, for that is a great thing which we want, and want quickly. We must recognise and this House must realise, however, that we are giving to the Government a blank

677

cheque in aviation, for that is what this Bill really means. [Hon. Members: "No!"] Under the system proposed the manufacturers of this country must stop immediately, but I understand that the Under-Secretary for Air has already consulted with the trade and has promised some modifications.

I want to ask for two assurances on points of general principle which, if the right hon. Gentleman will agree to, I am sure we can allow this Bill to pass. I want him to allow these people to design their own machines without control. Up to the end of the War no aeroplane was allowed to go up unless it had received the complete assent of the experts of the Air Ministry. I maintain that now we have got comparatively to peace, initiatives and all sorts of designs must be allowed to be developed wherever they like.

Inspection has not helped aviation as much as people think, for it started badly. Lord Kelvin said that dynamic flight was an impossibility. The Government designed machines, and even with all the help they got from scientific gentlemen the Government machines have not been the same success as machines made by private firms, which have knocked the Government machines out. This contemplated inspection of design is what I object to, and I ask that the Government should allow machines to be built and tried, and when they come forward, as firms will do, with machines ready, that the Government shall look at them and see whether they are safe from the public point of view.

The second point I would ask the right hon. Gentleman is, that the State shall not be allowed to hamper the industry by excessive inspection on the ground of the safety of the public—I do not mean after the machine is built, but during the construction of the machine. The risk of disaster must always be felt, and no regulation will ever get rid of that. We have seen in the case of ships, with all their wonderful watertight compartments, the "Titanic" sink. Commercial aviation is a commercial proposition, and if people are going to carry passengers in their machines they are going to have to pay if they kill people in those machines, and the right body to regulate and inspect machines is Lloyd's, and not the Government. The whole thing comes down to a commercial proposition, and you will have to bring Lloyd's insurance people into it. If the right hon. Gentleman can give me

678

later assurances on those two points I think that there will not be very much opposition to this Bill.

§

Mr. BARTLEY DENNISS There is no doubt that this Bill is absolutely necessary, and one matter which is strongly in its favour is that it is only a temporary provision. It is too soon to allow the British public to be put at the mercy of every rash individual who chooses to go in for aeroplanes either for sport or for commercial purposes. This is not the first Bill to deal with safety, for we have had before one Bill in 1911 and another in 1913 dealing with safety.

§

Mr. JOYNSON-HICKS No.

Mr. DENNISS There was the Air Navigation Bill of 1911, which was for the protection of the public—

§

Mr. JOYNSON-HICKS Have you read that Act?

Mr. DENNISS Yes, every word of it. The other Act was in 1913 which brings under the Defence of the Realm Act the coastlines and territorial waters of the realm. This is not a Bill to legalise military flying because that has already most elaborate provision. The object of this Bill is to deal with commercial or civilian aircraft, and that being so, I look at this measure with a great deal of doubt and hesitation. It is perfectly right and proper that for the present at least pilots' licences should be given by the Government pilots and aircraft should be registered and certified, because there is no other body at present which is capable of performing these very important duties. The first two lines of the first Clause of the Bill are enough to inspire one with a great deal of doubt as to whether or not this Bill may not be used to crush the commercial use of aircraft altogether because it says: "It shall be lawful for the Secretary of State by Order to regulate aerial navigation over the British Islands and the territorial waters adjacent thereto, and in particular...." "(a) the grant, suspension and revocation of licences to pilots and other persons engaged in the navigation of aircraft." It is the most general Clause I have ever seen. It allows the Air Council, which is the authority under the Bill to stop all aircraft and flying in this country. It can prevent them going out of the country or coming in or flying over the country. That being the case unless these regulations are inspired by people who are thoroughly

679

in sympathy with the commercial aspects of the aircraft industry then I am afraid that industry must very much suffer. We remember well what happened in the case of the motor traffic. We remember how the first motor vehicles were not allowed to use the public roads unless they had a man in front of them with a red flag, and they were not to go over four miles an hour. That ought to be a warning to the House. That was the first Government idea as regards motor traffic, and it completely put England behind the Continent in the manufacture and development of motor traffic. What I am afraid of is that this Bill may do something like the same thing with regard to aircraft.

Regulations have already been made with regard to sending expeditions to India. First, they go to Karachi, and then to Delhi. This has been done entirely under military auspices. I should like to know whether the right hon. Gentleman will allow the aircraft industry to run a flight of aeroplanes to Australia from this country, or will he restrict them absolutely to military men and military pilots. An association with which I am connected is anxious to make a trial of flying from London to Australia. The route as far as Karachi has been mapped out by the Government. Then to Delhi, afterwards to Calcutta and Singapore, touching the islands of Java, landing at Port Darwin in Australia. Then east or west or directly south to Adelaide, following the telegraphic line, running directly north and south. I want to know whether the Air Council will reserve to themselves all the rights of experimental flying from the United Kingdom to the various Dependencies. That is a matter which they might kill entirely by regulation.

§

8.0.P.M.

§

I had some little experience in the early part of the War as to the way in which the War Office look upon aircraft. I had occasion in 1915 to call at the War Office to introduce to the Transport Department a Bosch magneto, and the man who could make them, and at that time they were very much needed by the British Army; in fact, the transport was crippled for want of them. I saw an officer in the War Department and he told me he thought he could get five hundred a week at the time. I pointed out to him that Mr. Churchill was proposing to have a fleet of a thousand aeroplanes to be sent over the big towns of Germany, and that was a very

680

intelligent anticipation of Mr. Churchill in 1915. "Oh," said the major at the head of the Department, "nothing of the kind. Aeroplanes are of no use at all, except perhaps for scouting." And he turned down the proposition altogether. He said, "We cannot give up making our motors for our transports in order to make aeroplanes." The right hon. and gallant Gentleman says that he is not at the Air Ministry, but I hope that he does not know to whom I am referring, because I do not want him to know. That was the way in which, in 1915, I was met with regard to aircraft, and that sort of thing may happen in every Government Department. Therefore, while congratulating the hon. and gallant Member for Harrow (Mr. Mosley) upon his eloquent speech, and the way in which he developed this particular point, namely, the dead hand of bureaucracy upon progress in commerce, I should like to have some assurance from the hon. and gallant Gentleman that he does not contemplate keeping that dead hand upon aircraft navigation for ever and ever, but that he will at the earliest possible moment turn it over to the civil authority. A great French flyer is contemplating making a flight from Paris to Australia, and, if any difficulty is put in our way by the War Office or Air Ministry, I

## Notes on "Civil Aviation"

am afraid that the French will be first in the field. I might call the attention of the right hon. and gallant Gentleman to the report of the Aerial Transport Committee, at the end of which it says: "It is a matter of urgent necessity to establish a system of propaganda throughout the Empire in order to convince the whole nation of the vast importance and possibilities of aerial transport, and to familiarise the governments and local authorities with the subject. There is evidence of the initiation of such a system in every country." Undoubtedly, Germany and France and America and other countries will leave us far behind if the dead hand of bureaucracy is permanently planted upon the industry. The greatest objection which I have to this Bill is that which I have mentioned before and which has been mentioned many times in connection with similar Bills. It is that these Regulations for all practical purposes are made without any power in this House of controlling them in any way. My hon. Friend the Member for Twickenham (Mr. Joynson-Hicks) says that the ownership of the air is in the owner of the land. It is an ownership from the centre of the earth right up into the skies as far as you

681

can get. I very much question whether that is still the law. I am myself a lawyer, and I may say that I differ from him. We had a Bill in this House with regard to oil found under land, and it was very much questioned whether the owner of the land had any right in the oil. That question has never yet been settled. I dare say the same thing would occur with regard to the air. I live in a small place with a few fields round me, and I have within two or three miles of me the largest aeroplane station in England. They have been continually coming over my ground, flying so low that they wave to me below—a most dangerous thing to do—and looping the loop. I do not believe if I went to the Law Courts that they would grant me an injunction and say that I could prevent them flying over my ground. I see that the title of this Bill is the Aerial Navigation Bill. We talk about the Air Ministry and the Air Council. Why, therefore, have this awkward Greek word "aerial." I wish the right hon. and gallant Gentleman would consider whether it would not be better to give us a simpler word.

§

Captain WEDGWOOD BENN I need not say that I have no intention of opposing this Bill. On the contrary, I take the opportunity of welcoming it for the one reason that it concentrates in the hands of the Air Ministry the various powers dealing with air-craft which it had been suggested might possibly be diffused among various Departments of the State. I want to ask the right hon. and gallant Gentleman who represents the Air Ministry one or two questions. Does the Bill give the Air Ministry the power required to enable it to undertake pioneer work in aerial navigation—the setting up of the aerial routes both in this country and in the Empire generally—which we suppose is going to be one of the chief duties of the civilian side of that Ministry's work? Secondly, is it not possible—this is rather a point that we may deal with in Committee—to limit the certification of aircraft to aircraft which are going to be used for public purposes, so that a private pilot will be at liberty to fly any aircraft? I say this because there will be a danger that unimaginative officials will not give either the encouragement or the scope to the private, adventurer which the progress of aerial navigation undoubtedly demands. It is said that there is a danger to the public, but it must be remembered that the danger primarily is to the pilot and pas-

682

senger in the machine rather than to the public, and we might suppose that alone would be a sufficient guarantee that no excessively dangerous experiments would be made. The hon Member spoke of us being powerless under this Bill. I am under the impression that the Orders must be laid on the Table of this House and must remain on the Table for twenty-one days within which it will be competent for any Member to move an Address for the revocation or alteration of any one of them.

Mr. DENNISS The hon. and gallant Member knows that it is quite useless in practice.

§

Captain BENN The hon Gentleman will excuse me, but he is mistaken. On the contrary, this is exempted business, and we can go on debating an Address moved with regard to anyone of these Orders until the next morning. The right hon and gallant Gentleman in this Bill has at least given us the power to deal with the Orders when he brings them forward. The last Clause of the Bill says that the Act shall continue in force for one year. One would suppose that meant that the Act would expire at the end of the year, and that if it were not then renewed other legislation would be brought forward. The right hon. and gallant Gentleman knows, however, that there is a contrivance called the Expiring Laws Continuance Bill, and I should like to have from him the assurance that we shall not find in the Schedule of that Bill which is practically undebated the name of this Aerial Navigation Bill. I wish to ask those questions, and in the meantime to say that under the powers that he is taking much may be done by the Ministry over which he presides for the progress of this great science.

§

General SEELY I can only speak by leave of the House, but as briefly as possible I will answer the various points raised. We have considered the points advanced by the hon. Member for Twickenham (Mr. Joynson-Hicks), and especially we have had in mind the recommendations of the Aerial Transport Committee, of which he was a very prominent member. The provisional Regulations which we shall draft, and which are the only ones to appear under this Bill, will in almost all respects follow the lines of those recommendations. Again, in addressing myself to all the hon. Members who have spoken, I would emphasise that this is an interim measure, and that we must later

683

have a larger measure, which will put in the form of law the whole of the arrangements for the regulation of flying in the same way as there are propel, regular Acts—as for instance, the Board of Trade Act—to regulate either land transport or sea transport. I

## Notes on "Civil Aviation"

would again emphasise that this is a Bill by which alone we are enabled to give facilities for private individuals to fly. Without it they cannot fly, and it is principally for this reason that I commend it to the House. The hon. Gentleman particularly asked a question as to certification. We propose that certification should be done daily by persons appointed by the manufacturers, with the approval of the Air Ministry. Thus you will not have perpetual inspection by Government Departments, which would involve an immense number of inspectors, or mean that the thing would not be properly done.

§

Mr. JOYNSON-HICKS Does the right hon. and gallant Gentleman mean that every machine is to be inspected and practically certified every day? Supposing there is a line of aeroplanes running from London to Manchester, would they have to be inspected daily?

§

General SEELY Yes. The criticism made to me when I met the British Society of Aircraft Manufacturers was that the provision was hardly necessary, because, of course, every owner of aeroplanes must inspect them. I am sure it is a wise provision, and I also think it is wise to leave it to the manufacturers to make the inspection as part of their regular duty by persons approved by the Air Ministry. Subject to that, I believe it will work well. Those, I think, were the principal points which the hon. Gentleman put to me.

§

Mr. JOYNSON-HICKS There was the legal question about the right of flying over other people's land. What are you going to do about that?

§

General SEELY I was going to deal with that in some general remarks with regard to the legal aspect in replying to several hon. Gentlemen who have spoken. By this Bill, which I hope will become an Act, we shall be able to do the things named in Clause 1, but that does not by any means include any of the things which we must do if we are to have a proper code of law for the air. They must be put in the larger Bill. The question of penalties for the forging of certificates, for instance, cannot be dealt with under this Bill. The

684

ordinary common and Statute law, as we know it, will have to be the law for the time being. If we were to attempt to make a code of law for the air, it would mean a very large Bill and involve long Debates. Therefore, this Bill only sets out to do that which I have described in my opening remarks, namely, to enable civilians to fly, with a minimum of interference on the part of the State consistent with the public safety.

My hon. and gallant Friend the Member for Harrow (Mr. Mosley), the youngest Member of this House, made a speech to which I am sure we were all delighted to listen as coming from one who left a most distinguished regiment to fly over the Germans, and who flew as long as he could until he met with a sufficiently hard bang to force him to return to his other duties. We congratulate him on his escape and upon his return to this House. In his excellent speech, however, he did not take into account my opening remarks in which I laid emphasis on the necessity of avoiding bureaucratic control. I will reply to him and to my hon. and gallant Friend the Member for Chatham (Colonel Moore-Brabazon) at the same time by saying that the whole object of the Air Ministry, I can assure them, as long as I am there—and I know I can speak for my right hon. Friend (Mr. Churchill)—will be to see that the State helps and does not hinder, that it does its utmost to encourage new designs of every kind, that it does not profess to be a grandmother in any sense, and that all restrictions possible shall be removed.

We are determined the State shall only endeavour to open the way to skill and energy. It will not try to hamper or thwart independence of thought or action on the part of those engaged. When I came across the Regulations drawn up in the ordinary form, in which, following the precedent in regard to land craft it laid down that aircraft should be examined as to its suitability and safety, I struck out the word "suitability," because it seemed to me that the State had nothing to do with that. If somebody proposes to fly from here to Australia we should be only too delighted to help them in every way consistently with the general safety. If they want to fly on a kind of machine entirely new to us which we may think ill-adapted for the purpose, we shall not stop them so long as we are satisfied that the machine is reasonably safe. We shall have

685

nothing more to say on that point. As to the activities of the Aircraft Ministry, we intend to give the fullest information in our power as to new discoveries, making, of course, exceptions in regard to military secrets, but the public will be at liberty to take out their own patents and keep their own secrets. That seems to be peculiarly the duty of the State in this entirely new form of locomotion.

§

Lieutenant Colonel MOORE-BRABAZON May they build machines without submitting designs to the Air Ministry?

§

General SEELY Certainly. We shall only insist that they are reasonably safe, as is done in the case of ships at sea. We propose to follow exactly the precedent set in that case. If a man chooses to build a vessel, however fantastic in appearance, or design, if it is reasonably safe, the Board of Trade makes no objection. The State must do its duty to see that there is reasonable safety. There were three definite points put to me by my hon. Friend the Member for Leith (Captain Wedgwood Benn). The first was as to pioneer routes. The opening of pioneer routes is done by the military at the present time, and if the State is going to do it it will be the Royal Air Force which will take the duty. At the present time we can do what we please within the limits imposed by

## Notes on "Civil Aviation"

Parliament with military and naval aviation, and if the Treasury approve of the expenditure necessary for opening up new routes, say, from Cairo to Karachi, this Bill will not help us, but it will enable people to begin experimental flying.

With regard to certificates for machines which are not to carry passengers, I have been asked if everybody is to be entitled to break his own neck. I say undoubtedly he is so entitled. After all, the risk to those below is similar only to the risk people have of being run over by motor cars. I do not think it is necessary to require any form of inspection of machines to be flown by men themselves, nor is there any need that they should have certificates, as is requisite in the case of those who are going to carry passengers, goods and, it may be, mails. The principle that you must take care of yourself is a good one. We look forward to people doing in the future what they did in the early days of flying. They will really be pioneers. They will strike out entirely new lines,

686

making machines to their own designs—designs which all sorts of wise people may think to be useless and unsuitable for flying. Finally, I have been asked for a very definite pledge on a very technical point. I am very glad to give it. My hon. and gallant Friend wanted to be assured that this measure will not be included in the Expiring Laws Continuance Bill, which is generally passed without debate. It shall not be put into that Bill, and I hope as I give this assurance the House will help me to pass the bigger Bill which we intend to present to Parliament and which will enable this Bill to become obsolete. I think I have answered all the questions put to me.

§

Mr. JOYNSON-HICKS There was a question with regard to liability for accidents. Are we going to do away with the common law question of negligence? Suppose I am killed by an aeroplane from above, will my executors have to establish negligence on the part of the aeroplanist, or would compensation be given merely because I was killed?

§

General SEELY I put that point to the Attorney-General, and he was unable to answer it. I do not know how it stands. I think probably that negligence would have to be proved in the case of air accidents as in the case of land accidents. But that is merely my own obiter dictum. It is a long time since I was called to the Bar and I cannot claim that it is a sound opinion. I do not think this Bill will alter the position in that respect, but I will make a note of the point. It is a subject which must be included in the larger Bill which I shall bring in at a future date. If any hon. Members have any suggestions they would like to make on the general question and will send them to me in the course of the next few weeks, I shall be most happy to consider whether they come within the scope and intentions of the larger measure, and, of course, within the agreement for international flying. It is quite likely, this being a new Service, that there are points we may have overlooked. I do not know whether it would be reasonable to ask the House to take the Committee stage of this Bill tonight. I am entirely in the hands of the House, but, in view of the fact that we shall be discussing the larger Bill before very long, perhaps hon. Members might be not unwilling to accept this suggestion. Question put, and agreed to.

Bill accordingly read a second time.

687

Motion made, and Question proposed, "That the Bill be committed to a Committee of the Whole House."—[General Seely.]

§

Capta in BENN Is it proposed to take the Report stage to-day?

§

General SEELY If we have the Committee stage, I think we might leave the Report stage over.

§

Mr. DEPUTY-SPEAKER If the Bill be not amended in Committee, there is no Report stage.

§

Motion made, and Question proposed, "That this House will immediately resolve itself into the Committee on the Bill."—[General Seely.]

§

Mr. JOYNSON-HICKS I have been scribbling down a few Amendments while the right hon. Gentleman was speaking, and I am quite ready to take the Committee stage now if he and the Clerk at the Table will assist me with my rather badly written Amendments. There are no particular Amendments I wish to propose, but I desire to raise a few points which one has not been able to mention in Debate. If the right hon. Gentleman will accept the spirit in which they will be put, I shall not oppose the taking of the Committee stage now.

§

General SEELY I will certainly give every assistance in meeting the hastily-scribbled notes my hon. Friend has mentioned. I would not have suggested taking the Committee stage now but for the fact that all the matters which come up in the temporary Bill have been touched on in Debate. We might endeavour to get the Committee stage now, and take the Third Reading later if the House so desire.

§

Bill accordingly considered in Committee.

§

[Mr. WHITLEY in the Chair.]

## Notes on "Civil Aviation"

CLAUSE 1.—(Power to Regulate Aerial Navigation.)

HC Deb 17 February 1919 vol 112 cc687-92

687

§

(1) It shall be lawful for a Secretary of State by Order to regulate aerial navigation over the British Islands and the territorial waters adjacent thereto, and in particular, but without derogating from the generality of the above provision, he may by any such Order provide for—

(a) the grant, suspension, and revocation of licences to pilots and other persons engaged in the navigation of aircraft;

(b) the registration, identification, inspection, and certification of aircraft;

688

(c) the licensing, inspection, and regulation of aerodromes;

(d) the conditions under which aircraft may be used for carrying goods, mails, and passengers;

(e) the conditions under which goods, mails, and passengers may be imported and exported in aircraft into or from the British Islands, or from one of the British Islands to another.

(2) If any person contravenes or fails to comply with the provisions contained in any such Order he shall be guilty of an offence under the Aerial Navigation Act, 1911:

- Provided that if proceedings are taken by the Commissioners of Customs and Excise for contravention or failure to comply with any Regulation made under paragraph (e), the proceedings shall be deemed to be proceedings for the recovery of a penalty under the enactments relating to customs.

(3) Every Order made under this Section shall have effect as if enacted in this Act, but as soon as may be after it is made it shall be laid before each House of Parliament, and if an Address is presented to His Majesty by either House within the next subsequent twenty-one days on which that House has sat after the Order has been so laid, praying that the Order or any part thereof may be annulled, His Majesty may annul the Order or part thereof, and it shall thenceforth be void without prejudice to the validity of anything previously done there under or to the making of a new Order.

(4) The powers conferred by this Act shall be in addition to and not in derogation of the powers conferred by the Aerial Navigation Acts, 1911 and 1913.

§

Mr. JOYNSON-HICKS I beg to move, in Sub-section (1), after the word "State" ["a Secretary of State"], to insert the words, "with the approval of a Select or Grand Committee of the House of Commons." The point I want to press is that from a constitutional point of view we ought to know a little more of these Regulations before the House parts with this Bill. I do not ask that the right hon. Gentleman should consent to refer the Bill to a Grand Committee, but would it not be possible, before the Report stage or before the Third Reading, to show some of us the Regulations? We really are giving a blank cheque to the Government to make any Regulations they like. However friendly we may be to the Government, however much we desire to help them, yet they ought to give us some undertaking that we shall see the Regulations before the House finally parts with the Bill.

§

General SEELY I quite appreciate that my hon. Friend does not press this Amendment, because in its form it would be a rather novel procedure. The real point he

689

raises is whether the House cannot have some say in these Regulations before it finally parts with the Bill. I have the draft Regulations here. It would be a great convenience to get the Bill, in order to commence civilian flying. Would it not be well for me to ask hon. Members to take the Committee stage now, then for me to circulate the draft Regulations to those interested, and then to take the Third Reading? Those of us who have been many years in the House of Commons know that all sorts of pitfalls may be encountered. Any group of Members might object very much to this, that, or the other, and we might not be able to get the Bill through. I wish I could meet the wishes of my hon. Friends without losing the Bill. I am sure they appreciate, especially those of them who have been in previous Parliaments, that any Minister who wants to get a Bill for this purpose is likely to meet difficulties. Perhaps I could pass the draft Regulations round now, although I am afraid that would not give time for consideration. I am in the hands of the Committee, but I give my assurance that everything done under this Bill, and all that is proposed, are with the intention of giving the greatest possible latitude for civilian flying while insisting upon public safety. When the Regulations are laid my hon. Friends will have an opportunity of debating them outside the ordinary Rules of the House at any hour of the day or night. I respectfully suggest that it would be best to pass the Bill, then for me to lay the draft Regulations at the earliest possible moment, then by question and answer to elucidate doubtful points, and finally to accept my assurance that everything shall be done in this matter to help and not hinder.

## Notes on "Civil Aviation"

§

Major Sir HENRY NORMAN We are all desirous to help the Bill, which is evidently necessary. It is exceedingly drastic, but in view of what the right hon. Gentleman has said and the spirit in which he approaches all of us to take a special interest in the air, we naturally desire to help him to the utmost of our power. At the same time, we do not like to let the Bill go entirely without any idea of some of the more detailed aspects of the Regulations. Would it not be possible for the right hon. Gentleman to circulate his Regulations among those specially interests, or to any Member who specially desires to see them, between the Committee stage and the Report stage? There will have to be a Report stage, because

690

there is one purely verbal alteration which I want to suggest, which I am quite sure will be immediately accepted, I do not think the circulation of the Regulations will involve any delay.

§

Mr. JOYNSON-HICKS May I suggest another way out of the difficulty, namely, that the right hon. Gentleman should circulate the Regulations to the executive of the Parliamentary Air Committee? It is only a voluntary Committee, but everybody interested in flying is a member of it, and we shall be glad to discuss the matter with the right hon. Gentleman.

Captain BENN The right hon. Gentleman has already promised to accept one Amendment which necessitates a Report stage. May I remind him that although what he has said may be true of other Parliaments, this Parliament is a Parliament in itself, and that he has not been met by any form of obstruction. Our desire is to get the Bill, but we also desire to have an opportunity of considering it in detail, and, in particular, of considering the Orders to be made under it. I therefore suggest that the right hon. Gentleman should give us one or two Amendments—he has already indicated he is prepared to do that—and then let the Report stage be put down for another day. No one will obstruct the progress of the Bill. In the meantime perhaps the right hon. Gentleman would circulate these Orders he proposes to make to the Committee on Air, and also to the Air Force Committee, which comprises all Members of the House who have served in the Royal Air Force during the War.

§

General SEELY I should certainly think the best course will be to accept the suggestion made by the hon. Member opposite, and all we have to do is to make quite sure that there is a Report stage and pass rapidly through the rest of the Bill so that we may carry it out. I think that will probably meet the wishes of everyone. I will circulate the proposed Regulations—of course, they are only proposed Regulations now—to both the Committees which are referred to, and, of course, to any hon. Members who desire to see them. Then at a later stage we shall come to the Report stage and shall be able to approach it with full knowledge of what is done. Even in this, the model Parliament, obstruction may possibly hereafter be not entirely unknown, and I appeal to all my hon. Friends interested

691

in the Air Force to help us to get it through the important stage of Third Reading when the time comes.

§

Amendment, by leave, withdrawn.

Mr. DENNISS I beg to move, in Subsection (1), to leave out the word "aerial" ["to regulate aerial navigation"], and insert instead thereof the word "air."

§

General SEELY I entirely agree that the word "aerial" is a horrible word. It is so difficult to say. But at the same time it has been accepted for some time back as a proper term, and I cannot think of another. Air navigation, of course, has the objection that air is a substantive and not an adjective. My right hon. Friend tells me sea bathing has a substantive with it. It is perfectly possible that by the alteration of a title you may greatly inconvenience other possible words, but I will bear it in mind. If I can put it in on the Report stage I will. I share the hon. Member's objection to the term.

§

Amendment, by leave, withdrawn.

Captain BENN I bog to move, at the end of Subsection (1. b), to add the words, "used for carrying passengers, goods, and mails."

§

General SEELY That is certainly the intention, but it is a little dangerous to accept words at a moment's notice which may, of course, have the effect, if you are not careful, of prohibiting you from accepting others. I think if we could have the Amendment in these words, "especially those used for the carriage of passengers, goods, and mails," that would meet the case, and the House would have my assurance that that is the intention. Then we shall safeguard the State if it has to inspect at some other time for some other purpose.

§

Amendment, by leave, withdrawn.

§

Amendment made: At the end of Subsection (1, b), insert the words, "especially those used for the carrying of passengers, goods, and mails."—[Captain Benn.]

§

## Notes on "Civil Aviation"

Sir H. NORMAN I beg to move, in Sub-section (1, e), after the word "goods" ["The condition under which goods"], to insert the word "and."

As this Sub-section reads it shows a rather improper use of the English language. I want to suggest that it should read as follows: "The conditions

692

under which goods and mails may be imported and exported and passengers transported."

§

Amendment agreed to.

§

Further Amendments made: Leave out the words "and passengers."

§

After the word "exported," insert the words "and passengers transported."—[Sir H. Norman.]

§

Clause, as amended, agreed to.

17 February 1919 : HC Deb : Aerial Navigation Bill CLAUSE 2.—(Extension of purpose of Air Council.)

"The purposes of the Air Council shall include all matters connected with aerial navigation"

§

Motion made, and Question proposed, "That the Clause stand part of the Bill."

§

Mr. JOYNSON-HICKS I wish to ask a question as to the present position of civil aviation and the Air Council. We saw the other day that General Sykes had been appointed to deal with civil aviation and had resigned his position as a general officer. May I ask, not offensively, under what authority the Government appointed anyone to deal with civil aviation before passing this Bill. I have looked very carefully through the three Acts of Parliament which have been passed dealing with the air in 1911, 1913 and 1917, and there is no power at all to appoint anyone to deal with civil aviation. The Act of 1917, which constituted the Air Council, is purely a military Act.

The whole thing deals with the military position.

I see General Sykes is receiving some remuneration for his services.

I do not know how on earth it is done.

Someone has said, "This is a very curious Parliament and we do very curious things."

The Government has appointed this general officer to deal with a subject that he has no power to deal with under any Act of Parliament, and I assume they are paying a salary which they have no power to pay him at all. I should like a little information on that point. I am not quite sure how far the Air Council in its present form is the right body to deal with civil aviation. It is a purely military body, formed for military purposes and on a military basis, and you are going to put the whole control of civil aviation in this country—I am not using the term offensively—under a military autocracy.

I do not think that is right.

This Bill has come so suddenly and it is not being debated at any great length, but I think two Amendments ought to be made in this Clause.

I think the words "the purposes of the Air Council shall include all matters connected with aerial navigation" are a bit too wide. That power might include the manufacture of civil commercial aircraft and so forth. I think the words in the second line should be amended to include certification, inspection, and so forth. That would be ample to start with. Then I think there ought to be some civilian members on the Air Council. I would suggest a sub-section to the Clause to the effect that there should be civilian members attached to the Air Council to act only in connection with the question of civil aviation. The appointments would naturally be left entirely to the Government. I think the whole of the commercial side of aviation will feel rather seriously if they are put entirely in the hands of military officers. I have not the slightest word of complaint against the military officers of the Air Council, for whom I have the highest respect, but military officers do not always in a position of authority get on with the commercial world. I think it would be better that two or three members should be added to the Air Council for civilian purposes. Formally I move the omission of the Clause.

§

General SEELY In regard to the first point raised, namely, that there was no power to appoint Major-General Sykes as a member of the Air Council, the answer is that there was power to appoint him to look after civil aviation. We were so legally advised on the subject, but there was not power to appoint him a member of the Council. This measure when it becomes an Act will give us power to have a member of the Council for civil aviation. That is the object of the Clause. I can assure my hon. Friend that the vigilant eye of the Treasury would certainly never have allowed a salaried post to be improvidently made. That is one of the things on which they do keep the tightest outlook and the tightest hand, as I have reason to know. I think there is no doubt that legal power resided in us to appoint a controller of civil aviation. This Clause will give the man responsible for civil aviation a seat on the Air Council. In regard to the merits of that appointment, I would say that we were all exceedingly glad when General Sykes

## Notes on "Civil Aviation"

took the position, and I think the aviation world in general will be glad. When General Trenchard, I think with universal acclamation, came back as head of the military and naval sides of the Royal

694

Air Force, and General Sykes was approached with a view to his taking the civilian side, at any rate for the present, all those whom I was privileged to consult were unanimous in saying that with his peculiarly alert brain, which has been dealing for many months with the very problems on which aerial navigation is concentrating itself, namely, long distance flying in the air, we had an ideal man. It is quite true he is a soldier, but he has been a great many things besides, and the fact that he is now at his own request ready to serve civil aviation by severing his connection with the Royal Air Force, except so far as he remains on the retired list, will be an indication to the aviation world, to aircraft manufacturers, flyers and others, that he is whole-heartedly devoted to the interests of civilian flying. The reason why a soldier was selected is that just for the moment practically everyone who is interested in flying, with a few exceptions, has joined either the Flying Corps or one or other branch of the Service, and with hardly an exception all the pilots belong to the Royal Air Force. Thus for the moment it is almost certain that you will find the best man within the ranks of the Royal Air Force of the Army or the Navy. That that will continue to be so I do not say. I should say it will not, but at present it is the case.

With regard to making the Council more civilian in character, perhaps my hon. Friend did not observe that we have a considerable number of civilians on the Air Council. I shall, I suppose, shortly be demobilised. My right hon. Friend (Mr. Churchill) is already demobilised. A civilian, Lord Londonderry, who is a member of the Air Council, will represent the Department in the House of Lords. Then we have Sir Arthur Duckham, Sir James Stevenson and Sir John Hunter, the last still technically a member of the Council. Therefore, there is a large civilian element, and though some of these gentlemen are there specifically for the purpose of concluding contracts and generally winding-up the affairs of the War, one of them will certainly always remain, and I should think, as time goes on, it will probably be the case that the man to whom the destinies of civil aviation are confided will tend more and more to be a business man, a civilian, even though he may have served in the Royal Air Force. I hope that will satisfy my hon. Friend.

695

§

Mr. JOYNSON-HICKS There is also the question of the very wide scope of the Clause.

§

General SEELY I have made a note of that, and I hope the hon. Member will not press the point. I can assure him that we have no intention of going into the aircraft manufacturing business, and if we ever attempted to do it, what I say now would be brought up against us and make the thing impossible, for a Ministerial pledge is a Ministerial pledge that has to be kept as long as the Government survives. To confine it rigidly to the points specified would be inconvenient. I can assure the Committee that we have no ulterior motive whatever in making the Clause so wide. It is not unprecedented in its wide nature. It is necessary that the Air Ministry should have the power to act to the best advantage in all matters connected with aerial navigation or transport. We do not want to act in order to hamper the industry. On the contrary, as I have said more than once. But I think it is necessary that we should have the power whenever the occasion arises to make the necessary Regulations, that any other Government Department has, in regard to land or air transport.

Captain BENN I cannot support the hon. Gentleman behind me in regard to this Clause, because I understand it is a Clause by which the Air Council seeks power not only to deal with all these aerial matters, but to prevent other Government Departments interfering. That seems to be an extremely desirable thing. The air is an element that must be treated as a whole, and it must be controlled as a whole, so far as the State is concerned, in the hands of one authority. I would point out, however, that the civilian has a very proper and well-grounded suspicion of military control. The names of the most successful machines during the War prove how much we owe to the civilian manufacturer. I have no objection to the appointment of this brilliant officer (General Sykes) to the position of head of civil aviation, but the right hon. Gentleman must remember that the Government has been so constructed that the whole of this Air Ministry is put in what we think is a subordinate position to the War Office, and that emphasises tenfold the suspicion that the public must have of the military element in the Ministry. I hope myself that so far from military predominance after the War, this Ministry,

696

which deals with the most progressive of sciences, will be kept in touch with the most progressive of civilian opinion.

§

Clause 3 (Short Title and Duration) agreed to.

§

Bill reported; as amended, to be considered To-morrow, and to be printed. [Bill 6.]

25 February 1919 : HL : AIR NAVIGATION BILL.- Brought from the Commons; read 1a, and to be printed.

26 February 1919 : HL Deb : AIR NAVIGATION BILL : Order of the Day for the Second Reading read.

§

## Notes on "Civil Aviation"

THE PARLIAMENTARY UNDERSECRETARY OF STATE FOR AIR (THE MARQUESS OF LONDONDERRY) My Lords, in rising to move the Second Reading of this Bill I ask your Lordships' indulgence, for, although I have spent a certain number of years in both Houses of Parliament, it has not been my privilege to fill such an important position as the one I occupy now in bringing to your Lordships' notice the Second Reading of a Bill of this description. I feel that at this late stage of the evening I should not be entitled to go into the briefest possible survey of the important matters which have actuated us in moving the introduction of this Bill. But I should like to draw your Lordships' attention to the fact, which has been forced upon our knowledge in the last few years, that the science of the air—a subject we have to regard in its entirety—although it has come quickly upon us, is something which we have to consider as controlling much of our everyday life. A Bill of this description is a measure which even the present generation quite a few years ago would have said would be introduced in a future which none of us would possibly see. I am anxious this evening to impress

384

upon your Lordships the importance of the measure I am introducing.

Hitherto there has been a prohibition of civilian aviation. Consequently, unless a measure of this description is passed, the progress of the industry and of the science itself will be retarded, and we shall be placed in an inferior position in the competition for supremacy in the air which I think we can claim to have at this moment, and which I sincerely hope we shall maintain for all time. We know that there have been various experiments from the earliest times of history with a view to obtaining the mastery of the air, but until the period which stretches over the last ten years we have never been able to say that we have achieved that supremacy and conquered that force of gravity which hitherto has dominated the universe. We are in an analogous position to our forefathers some eighty years ago when railway travelling was first inaugurated in this country, and I think that we are entitled to say that we shall be able to look forward in the future to as great an expansion of this industry of aviation as we have been able to see in railway travelling from the early years of the last century until now.

In making these general remarks I would venture to say a word of caution, and that is that while we are all optimistic and believe that there are immense possibilities in this great science, still we feel that any hasty legislation, or any steps taken without due care and consideration, will retard the objects in view and hamper and hinder those great purposes which we hope to see carried to successful fruition at no distant date. In 1914 the sole functions of aircraft were reconnaissances for the Army and artillery observation, and since then we have seen during the various stages of the war the great progress which aviation has made, and also the great achievement of aviation as one of the decisive factors in bringing about the termination of the great struggle which we are glad has ceased, we hope for ever.

The Bill which I am introducing to-day, as your Lordships are doubtless aware, is an enabling Bill to allow the Government to introduce those Orders which will regulate for the future civil aviation. Your Lordships are also aware that during the war a strong Committee—the Civil Aerial Transport Committee—has made certain recommendations for the regulation of aerial

385

transport when re-opened, which include the licence to pilots and the registry of machines. This Bill is to authorise the issue of Orders which will define what steps shall be taken to carry out these purposes. To carry out these recommendations will require permanent legislation; consequently this Bill is only a temporary measure.

There is also the question of inter-State flying by civil aircraft, which is now being considered by representatives of the Allied Powers in connection with the Peace Conference, for which an International Convention must be prepared and approved by the Allied Powers. To secure the passing of this Convention, and of permanent domestic legislation, will take a certain amount of time, and His Majesty's Government had these two alternatives placed before them. The first was to make temporary provision by emergency legislation, and the second was to postpone the re-opening of civil flying until such time as the permanent Act embodying the findings of the Civil Aerial Transport Committee and the results of the International Conference on Aviation could be enacted. His Majesty's Government decided that it was desirable to adopt the first of these two alternatives, and to provide, by means of the Bill which is now before your Lordships, for the regulation of civil aviation, embodying in Orders to be made under the Bill those provisions of the recommendations of the Civil Aerial Transport Committee which are suitable for the occasion. I desire to press upon your Lordships that this Bill is an enabling Bill only, and that the actual re-opening of civil aviation will depend upon the enactment of the Orders which are provided by this Bill. It will also be realised that, having regard to the enormous development of aviation during the war, it was impossible to revert to the old system of practically unrestricted flying which prevailed up to the beginning of the war. The matter is one which concerns the safety of the public, and therefore your Lordships will appreciate the necessity of the control of flying by His Majesty's Government for that most important purpose. Before the war the safety of the public on the ground was alone considered. With the expansion of aviation which we see coming it is obvious that the safety of the public in the air—if I may use the expression—must also be safeguarded. It will be seen that

386

provision is made in this Bill for laying all Orders under it on the Table of both Houses of Parliament. That gives an opportunity to either House to raise objection to what is contained in the Orders with a view to revoking those Orders if need be.

As regards the Orders themselves, I should explain that they are being drafted in the Air Ministry, and that at every stage of them the fullest possible consultation is proceeding with representatives of the aircraft industry and with representatives of the House of Commons, where, as your Lordships are aware, there is a Committee which sits for the purpose of considering these matters as they advance stage by stage. If your Lordships consider it right to have a similar Committee in this House—I know well that a

## Notes on "Civil Aviation"

great number of your Lordships take a deep interest in aviation—any recommendation made by that Committee will, I need hardly say, be most carefully considered by His Majesty's Government.

I would also explain that the basis of the Orders is the interest of public safety, and that all the provisions of them are being framed with that object in view, and will be as little restrictive as possible bearing that object in mind. Your Lordships are aware that in the discussion in another place certain Amendments were proposed. The contention was that this Bill was a restrictive Bill, and was inclined rather to hamper and hinder the industry than to give it the free scope which is necessary at these initial stages to allow us to extend the industry and to maintain supremacy over all other nations. I should like to emphasise this point, that it is necessary that regulations of licensing and of registration should be made in the interests of the safety of the public. Apart from what is necessary for that purpose, the desire of His Majesty's Government is in no sense to hamper civil aviation in this country.

In asking your Lordships to give a Second Reading to this Bill I would also crave your indulgence for a further point with regard to the importance of the Bill, without which the prohibition of civil aviation remains, as it is at present, in its most stringent form. I would ask your Lordships' permission to allow this Bill to pass through all its remaining stages to-

387

morrow. It is a measure of great importance, and I apologise to your Lordships for asking you to adopt a course which is distasteful to all of us. But when your Lordships realise that during all this time there has been this hindering regulation which has cramped the activity of those who are energetically disposed to concentrate all their powers into giving us the opportunity of keeping that supremacy which we have maintained and are proposing to maintain to its fullest extent, I feel that your Lordships will agree that the sooner we can have this Bill passed into law the better. I beg to move.

§

Moved, That the Bill be now read 2a.—(The Marquess of Londonderry.)

THE MARQUESS OF CREWE My Lords, I rise to congratulate the noble Marquess opposite on the very capable manner in which he has performed his task of explaining this Bill in, I fear, a very empty House. I do not propose to discuss the terms of the Bill. The noble Marquess made an interesting suggestion, as I understood, that a Committee of your Lordships' House might be formed which would act with the Air Ministry for certain purposes of administration.

I have no doubt that there are not a few members of your Lordships' House who are well fitted by experience and interest in the subject to become members of such a Committee, and I merely mention the matter in the hope that the noble Marquess will take an opportunity of bringing his suggestion to the notice of the House, or to individual members of it in some form, lest in present circumstances his suggestion should escape the notice of those who might be interested in it.

As regards the intention of the noble Marquess to move on behalf of His Majesty's Government to-morrow that Standing Order No. XXXIX. be suspended, I personally have no objection to raise to that course, as I understand that the matter may be somewhat urgent. Of course, it is impossible to say whether some noble Lord may not desire to move Amendments, but I have no knowledge that any one does, and, so far as my friends and I are concerned, we shall raise no objection to the course proposed.

§

On Question, Bill read 2a, and committed to a Committee of the Whole House.

THE END CAME ALMOST SIMULTANEOUSLY ' WITH THE PASSING OF THE MOST CRITICAL MOMENT IN THE GREAT GERMAN PUSH IN MARCH, 1918. ON THE FIRST DAY OF THE PUSH, MARCH 21ST, THE R.F.C. WAS HELD UP ALMOST ENTIRELY BY DENSE FOG, BUT FROM THEN ONWARDS ONE MAY SAFELY SAY THAT THE AVIATORS HAD THE TIME OF THEIR LIVES.

THEY LOST THEIR AERODROMES, THEY LOST THEIR KIT, THEY LOST AEROPLANES BY THE HUNDRED, THEY LOST THEIR STORES, THEY LOST THEIR SPARE PARTS, THEY LOST THEIR TRANSPORT, BUT THEY NEVER LOST THEIR SPIRITS. IT WOULD BE WORTH SOMEONE'S WHILE TO WRITE A BOOK ABOUT THE R.F.C. IN THE RETREAT ALONE. NOTHING HAS BEEN MORE GALLANT, AND SOMEHOW NOTHING HAS BEEN MORE COMIC, IN THE HISTORY OF THE WAR.

SOMEHOW PEOPLE GOT AWAY FROM THE FORWARD AERODROMES, SOMEHOW THEY GOT BACK TO THE REAR, SOMEHOW THEY FOUND NEW MACHINES, AND WHEN THEY FOUND THEM THEY PROCEEDED TO TAKE IT OUT OF THE HUN FOR ALL THEY HAD LOST.

## The People on the Ground.

The people in the air were magnificently backed up by their own people on the ground.

No. 2 Aircraft Supply Depot, which had been built as if it were intended for a permanent aircraft factory, had to be evacuated.

1. The personnel and as much of the material as was possible was loaded up on trucks and dumped down on a bare plain by the sea. coast in pouring rain.
2. They had no sheds, and they had to find Bessonneau marquees where they could.
- 3.
4. Three days after they left their old home, and with only one Bessonneau as a workshop, they had turned out their first rebuilt machine, and from then onward they never stopped work day or night till the danger was over.
- 5.
6. The men slept in the open, under lorries and tenders, under shelters made of condemned wings.
7. They had no cooking arrangements, they lived as hardly as the retreating infantry.
8. And all the time they carried on the delicate and vital work of rebuilding and tuning machines and engines.
9. The squadron mechanics at the aerodromes worked till the last moment to get machines away.
10. At some aerodromes repairs were only done in time for mechanics to start up the engines and climb into the passengers' seats of the machines as Hun shells or bullets began falling in the sheds.
11. In some places ground officers and mechanics set fire to their sheds and bolted out of one side of the aerodrome as the enemy's infantry came in at the other.
12. It was a wonderful show, and one honestly believes that most of the R.F.C. people enjoyed it.
13. At any rate, not one to whom one has talked about the retreat would have missed it for a fortune.

01 April 1918 : RNAS consists of 67,000 (XXX) officers and (XXX) men, 2,949 aircraft, 103 airships and 126 coastal stations.

01 April 1918 : RFC consists of ??,000 (XXX) officers and (XXX) men, ??? aircraft, ?? airships and ???

01 April 1918 : RNAS merges with the Royal Flying Corps to form the Royal Air Force. The leading RNAS pilot is Canadian Raymond Collishaw with 60 victories. The same day, the Women's Royal Air Force (WRAF) is created. Between 01 April 1918 and 11 Nov 1918 a total of 31,090 women will volunteer to serve in the WRAF, their commitment to support their country. Most women serve in Britain, but about 500 will serve in Germany and France in 1919. The WRAF of WW1 is de-mobilised and disbanded in 1920.

01 April 1918 : UK AID Director, Lt-Col Bagnall-Wild, becomes a brigadier-general.

April 1918 : Hugh Trenchard summoned to Buckingham Palace to explain his resignation to King George V.

1. Trenchard tells the King: "Rothermere [a newspaper magnate] is impossible to work with"
2. Trenchard questions Rothermere's "basic competence to be a Government Minister, let alone lead the new "Air Ministry".

Trenchard's comments got back to the Prime Minister, Lloyd George.

15 June 1918 : Hugh Trenchard appointed General Officer Commanding, Independent Air Force [soon to be the Royal Air Force].

17 April 1919 : Secret Session of Canadian House of Commons : commons are told the "Allied armies face possible defeat".

19 April 1919 : Conscription bill is passed in Canada.

Spring 1918 : Canadian government proposes [to the UK Government] to form a wing of eight squadrons for service with the Canadian Corps, France.

## Notes on "Civil Aviation"

30 April 1918 : the Canadian High Commissioner in London suggests that the government consider forming a Canadian Air Force (CAF) in England. His proposal was based on the fact that so many Canadians were already serving in the Royal Air Force, and they had expressed a desire to serve in Canadian Squadrons. In considering the proposal, the Canadian government made a study in July and discovered that some 13,000 Canadians were serving in the RAF, of whom 850 were on secondment from the Overseas Military Forces of Canada. This study finally brought the Canadian Privy Council around to discussing the possibility of forming Canadian squadrons within the RAF, with the eventual aim being the formation of the Canadian Air Force.

by Summer 1918 : At least one-quarter (possibly one-third) of the RAF was Canadian. The British are reluctant to permit a major reorganization (and disruption) of their aerial service just as the war was reaching a successful climax.

23 May 1918 : BRIG.-GENERAL DUNCAN SAYRE MacINNES, C.M.G. D.S.O.. Royal Engineers (Born at Hamilton, Ontario, July 19. 1870 to son of the late Donald MacInnes, of Hamilton, Canada, a member of the Senate) He entered the Royal Military College, Kingston in 'September, 1887, and passed out "first", obtaining a commission in the Corps of Royal Engineers on July 16, 1891. On July 18, 1894, he became a Lieutenant; April 1, 1902, a Captain; in 1911 a Major; in 1915 Lt. Colonel ; and held the rank of Brig.-General at the time of his death. In 1895-6 he was in the Ashanti Expedition and was honourably mentioned and received the Star issued for the campaign. He was engaged in the erection of the fort at Coomassie where he afterwards acted as Resident. In 1900 the garrison of this fort successfully held out against 15,000 Ashantis and General Sir James Willcocks speaks of it in his book, "From Kabul to Kuraassi, " as "the best defensive post I have seen in West Africa." From 1905-1908 he was on the Staff in Canada, first as D.A.G.M.G. at Halifax, and then as D.A.A.G. During these years he was responsible for planning the defences of Halifax. In 1910 he was gazetted G.S.O. (3rd grade) under the Director of Military Training at the War Office ; Having graduated at the Staff College, Camberley, he was appointed a General Staff officer in the Department of the Director of Military Training at the War Office, and was also one of the War Office members of the Royal Engineer Committee. Subsequently he was appointed a member of the Directing Staff of the Staff College, an appointment he was holding when the war broke out. In 1912 he was secretary of the Royal Flying Corps Committee. The result of this Committee led to the formation of the Royal Flying Corps. In 1913 he was appointed G.S.O. (2nd grade), to the staff of the Staff College. On the outbreak of war he proceeded at once to France. After taking part in the retreat from Mons, for which he received the personal thanks of one high in command. He was wounded in November, 1914. The wound partially disabled his right hand. In 1915 he served at the War Office as Assistant Director, and in 1916-17, as Director of Aeronautical Equipment. In the following year he served as an Assistant Director in the Department of Military Aeronautics at the War Office, and in 1916-17 was Director of Aircraft Equipment. For his services he received the C.M.G. As Director of Aircraft Equipment Gen. MacInnes had to face a most arduous task. It fell upon him to evolve from the formless muddle of 1915 some regular scheme for organising and increasing aircraft production simultaneously.

All those who served with him at that period bear witness to his unflagging zeal and to the amount of personal effort which he expended. If hard work on the part of one man could have produced the necessary aeroplanes and engines Gen. MacInnes would assuredly have obtained them. Despite an infinity of natural obstacles and personal hindrances he succeeded in effecting remarkable increases in output, and, at the same time, he won the personal affection of all those who worked with him or under him. The intensity of his efforts nearly broke down his health, but before he left the War Office to take a command in the field he had done much spadework which afterwards proved of high value. Full recognition was given to his services when, at a dinner given to him on his departure, the Air Minister (only recently appointed Director-General of Aircraft Production) referred in the highest terms to the worth of his achievements in laying the foundations of aircraft production on a thoroughly sound basis. His name deserves to live in the history of military aeronautics as one of those who helped the R.F.C. out of its blackest days.

"The Aeroplane," of May 29. 1918;

and a General writes, "I think it is only those few people who worked with him in the early part of the war who really recognize how much the Royal Air Force owes to his untiring energy and splendid qualities. I never met a man who worked so hard and so conscientiously, and this in spite of the fact that he was suffering from the effects of a wound, and of general bodily ill-health brought on by the trying time that he had had during the retreat."

In March, 1917, he reverted to Colonel's rank in order to return to the Front, and became Commanding Royal Engineer to the 42nd Division. Nine months later he was appointed Inspector of mines at Headquarters, with the rank of Brig.-Gen. He was killed in action on 23 May 1918 and buried at Staples on May 25th.

## Notes on "Civil Aviation"

June 1918 : London, UK : 24 year old William Avery "Billy" Bishop appointed to the Staff of the Air Ministry,

June 1918 : Captain Brian Peck, an instructor in the Canadian-based RAF training scheme, together with a mechanic, Corporal E.W. Mathers [the Aerial League of the British Empire and the Royal Air Force]. <sup>103</sup>

23 June 1918 : The first airmail flight in Canada. A Military JN4 aircraft piloted by Captain Brian Peck, an instructor in the Canadian-based RAF training scheme, together with mechanic Corporal E.W. Mathers carry a mailbag with 150 letters from Montreal back to Toronto, complete with special envelope cancellations dating the flight <sup>104</sup>

28 June 1918 : world-wide League of Nations founded in Paris. <sup>105</sup>

09 July 1918-Katherine Stinson-Carries the first airmail for the Canadian government. Her Calgary to Edmonton air mail flight was the second-only such conveyance in the dominion and is logged as PF-7 in "The Air Mails of Canada and Newfoundland"

5 August 1918 the UK Air Ministry authorizes the formation of two RAF squadrons to be manned entirely by Canadians squadrons, one a fighter squadron and the other a bomber squadron. (Canadian Order-in-Council confirms the formation of the Canadian Air Force (CAF) on September 19 for "the purposes of the present war")

05 August 1918 : William Avery "Billy" Bishop transferred to "Canadian Headquarters", promoted to Lt. Col.

What would become of the fledgling CAF?

"In the immediate aftermath of the First World War, Canada's need for an air force was not readily identifiable," <sup>106</sup>

"The country faced no discernible external threat. Canadians had little appreciation for expenditures on such esoteric military commitment".

Broadly, the statement made by Canada of her position, in which the Imperial Government concurred, was that for matters of military operations the Canadian Forces in the Field had been placed by the Canadian Government under the Commander-in-Chief, British Armies in France ; in matters of organisation and administration, the Canadian Government still retained full responsibility in respect to its own Forces.

It was clear that matters of organisation and administration would frequently have a direct bearing upon military operations and discipline, and vice versa , and it was agreed that in such cases these matters should be made the subject of conference between the Canadian and Imperial Authorities.

General Headquarters, by the Canadian Corps, and by Canadian Units on Lines of Communication, with results which have proved highly satisfactory to all concerned.

The Headquarters of the Section under the command of Brigadier-General J. F. L. Embury, C.M.G., are on the Rue de la Chaine at Montreuil, where are the General Headquarters Staffs of the British Forces in France.

On the signing of the Armistice, the Section was fixed with greater responsibilities consequent upon the movement of troops from the Lines of Communication to England,

### Engineer Training.

The importance of efficient Engineer Units in the field cannot be over-estimated.

The greater the knowledge and skill of their personnel the more vital their value to the fighting troops.

<sup>106</sup> W.A.B. Douglas - official history of the Royal Canadian Air Force - Vol. 2

## Notes on "Civil Aviation"

Skilled workmen are essential, and carpenters, bricklayers, masons, iron-workers and men drawn from similar trades, were selected for the Canadian Service.

The Engineer for service in the field must, however, first be made a fighting man, and the military efficiency of the Canadian Engineer was established at the Canadian Engineers' Training Centre at Seaford.

Here his technical knowledge was adapted to his military duties and he was given instruction in such special subjects as the construction of trenches, dug-outs, headquarters, gun-emplacements, wire entanglements and concrete and timber shelters. Road repairing, water supply, bridge building, pontooning and the rehabilitation of devastated areas, were also included in the training of the Canadian Engineers.

In the mounted wing, recruits were taught to ride and drive and to operate the transport equipment of the unit.

### TRAINING OF INSTRUCTORS.

(a) Canadian Infantry Instructors 5 Fool.

The maintenance of large drafts of officers necessitated a constant supply of highly trained and competent instructors, both of commissioned and non-commissioned rank.

### CANADIANS AT IMPERIAL SCHOOLS.

While every effort has been made to render the Canadian Forces self-supporting it has, on occasion, been considered advisable to take advantage of the facilities offered by some of the schools of instruction provided by the Imperial Authorities in England.

In some cases this procedure was adopted in order to effect economy, notably in regard to Camouflage and Wireless Telegraphy, as there was not a sufficient number of Canadians requiring instruction in these subjects to justify the establishment of separate schools.

In other cases attendance at Imperial Schools was desirable in order to standardise instruction in special subjects.

One of the most important schools of instruction established by the Imperial Authorities during the War was the Senior Officers School at Aldershot, which was designed to prepare suitable officers for the position of Battalion Commanders.

The course was of three months' duration and the 135 Canadian Officers who passed through this school were all reported on very highly.

During the year prior to the Armistice, 11 Canadian Officers also attended the Senior Staff Course and 27 Officers the Junior Staff Course at Clare College, Cambridge, and in every case these officers were subsequently recommended as competent to fill appropriate staff positions.

It is, indeed, a matter for congratulation that Canadian officers and non-commissioned officers attending Imperial Schools have throughout acquitted themselves with credit.

### INSTRUCTORS FOR THE AMERICAN ARMY.

In January, 1918, a request was received from the War Office for the services of a number of Officer Instructors to proceed to the United States, together with a number of noncommissioned officers, to advise and assist in the training of the American Army for the Field.

A party of Specialist Instructors, consisting of twenty-five officers and

twenty-five non-commissioned officers, was

accordingly selected and despatched to the United States to work under the direction of the British Military Mission.

These officers were distributed amongst the various training Camps of the American Army and were attached to American Formations then in process of organization, their services in every case giving the highest satisfaction.

### SECONDED OFFICERS.

at the date of the Armistice the number of Canadian officers attached or seconded to the Imperial Troops or other Forces outside the Overseas Military Forces of Canada was 1,281.

Of these 1,281,

824 were seconded or attached to the Royal Air Force, of which

- 511 were Flying Officers,
- 57 were Administrative, Technical or Instructional Officers and
- 256 were under instruction in aviation.
- Every facility has been granted to Canadian officers desiring to serve with the Royal Air Force as Flying Officers, but

## Notes on "Civil Aviation"

- Service on ground duties:
  - has not been encouraged, except in the case of officers specially qualified, or
  - in the case of Flying Officers unfit for further service in the air.

On November 11, 1918,

384 Canadian officers were seconded to the War Office for Military duties. Of these

133 were seconded for duty on the Lines of Communication,

8 were employed with the Salvage Corps and

18 with the Labour Corps.

20 officers were holding other appointments with Imperial Formations,

9 were employed as Instructors at Army Schools and

27 were with the Railway Transport Service.

57 officers were with the special Military Mission, including:

the British Military Mission to the United States of America, and

the North Russian Mission.

14 were serving with the Royal Garrison Artillery, and

25 Medical Officers were on loan to the Royal Medical Corps.

73 officers were employed on various other duties.

8 officers were attached to the Admiralty and

67 officers, possessing special qualifications, were employed in various other Departments of the British Government.

The pay and allowances to officers seconded or attached for purely Military purposes is borne by the Canadian Military Funds ; but pay and allowances of officers seconded for semi-military or civil duties is refunded by the Imperial Government.

The general question of the incidence of the cost of the pay and allowances of Canadian officers, seconded or attached to the War Office, is now the subject of negotiations between the Imperial and Canadian Governments.

In view of the cessation of hostilities, the War Office has been requested to return all Canadian officers seconded or attached to the Imperial Forces, other than those serving with the Royal Air Force, as soon as their services can be spared, and no further attachments or seconding will be carried out.

The whole question of those officers who wish to remain in the Royal Air Force is receiving special consideration.

Originally, the administration of Military Law affecting the Canadian Troops in this country was carried out solely by the Imperial Authorities acting through the Army Council and the General Officers commanding the different Imperial Commands. Since December, 1916, however, this position was carefully but steadily modified by the adoption of the principles of control of Canadian troops in England by the Canadian Government through the Minister, Overseas Military Forces of Canada and his Military Advisers. The first modification arose in connection with the applicability to Canadian Troops of the Royal Warrant for their pay, etc., and early in 1917 it was established that Canadian Orders in Council and Canadian Pay Regulations should govern this subject exclusively.

Since then the principle has been extended to all disciplinary regulations. King's Regulations (Imperial) are still, it is true, in general use, but this is for the most part a matter of convenience and it is recognised that they are only applicable where they are consistent with Canadian Regulations bearing on the same subject. Army Council Instructions and Routine Orders are only made applicable to the Canadian Forces when considered desirable by the Canadian Authorities. No Imperial Order or Army Council Instruction is applicable to the Canadian Overseas Military Forces unless made so in Headquarters Canadian Routine Orders.

### DISCHARGES IN ENGLAND

Prior to the Armistice the discharge of Canadian Other Ranks in England might be roughly divided into two classes—those who were discharged in order that they might accept commissions or be re-engaged on some branch of the Imperial Service, and those who were discharged to civil life or to engage in work of National Importance. Those of the first class included soldiers whose applications for training with a view to commissioned rank in the Imperial Service had been favourably considered and those who had undergone a course of training at a Cadet School and had been granted a commission in the Imperial Army. It also included those who had been granted commissions under the Admiralty and those who had been appointed Flight Cadets in the Royal Air Force.

The second class consisted of men who might have been asked for by the Imperial Authorities for work of National

## Notes on "Civil Aviation"

Importance in such departments as the Ministry of Munitions, the Ministry of Food and the Ministry of Shipping. Such men were usually in a low category, and in most cases it was considered that they would be of greater value if they were employed on such work rather than if they continued to serve in a Military capacity. In the same class also came the very infrequent cases of men who were discharged in England on compassionate grounds and also those cases of soldiers boarded for discharge or invaliding to Canada on account of medical unfitness, who had applied for discharge in England.

In respect to the last-named cases it was the settled policy of the Canadian Government that members of the Canadian Forces found no longer fit for War service should be discharged in Canada, and that discharge would not be permitted in England except under very exceptional circumstances and where grave hardship would otherwise be caused to the individual concerned.

It is difficult to ascertain the number of Canadians who have been in the Royal Flying Corps, the Royal Naval Air Service, and later the Royal Air Force, at any given date, for the reason that they have entered these Services through so many different channels.

They have, however, entered through three main channels.

- 1) officers were seconded to the Air Forces from the Overseas Military Forces of Canada. These officers still remained Canadian officers, although so seconded, and were liable to recall, if necessary.
- 2) non-commissioned officers and men were discharged from the Overseas Military Forces of Canada for the purpose of entering the Royal Air Force. This they did in large numbers, receiving commissioned rank in it as soon as they qualified.
- 3) a very large number of cadets were enlisted by the Imperial Authorities in Canada. At no period were these latter under the direction of the Overseas administration, but were in the same position as if they had enlisted in England.

The following statement shows the numbers of Canadians who have entered the Royal Flying Corps, the Royal Naval Air Service, or the Royal Air Force in the manner indicated :—

1. Officers seconded or attached to the R.F.C., R.N.A.S., and R.A.F. up to December 31, 1918 1,239
  2. Other ranks of the Overseas Military Forces of Canada transferred to the above from June 1, 1916 to December, 31, 1918 2,721
  3. Cadets enlisted in Imperial Authorities to the above Services Canada by the and despatched 4,280
- Total 8,240

In addition to the above a number of other ranks, who subsequently received commissioned rank, were transferred to the Royal Air Force prior to June 1, 1916, but the exact figures are not known. Also a certain number of Canadians came over at their own expense to England and joined the Flying Services, while a certain number who came over to join British Regiments have also subsequently transferred to the Royal Air Force.

At the date of the Armistice there was a large number of cadets in course of training in Canada who, as a consequence of the Armistice, did not come Overseas. There were also a very considerable number of other ranks employed in Canada by the Royal Air Force, and although it is impossible to give exact figures, there have been in the Air Force probably well over 13,000 Canadians of all ranks.

Those mentioned in the first category of the above statement have been issued with pay from Canadian funds ; those mentioned in categories two and three are paid by the Imperial Authorities.

There have also been a number of Canadians who have served in the ranks in the Air Forces in England and France, amounting to approximately 350. Although the Royal Air Force was entirely under the direction of the Imperial Authorities, yet, in view of the large percentage of Canadians included in its personnel, it was felt by the Minister that it was proper that some action should be taken to recognise their Canadian identity, and to ensure that a record of Canadians in the Royal Air Force and of their exploits should be kept.

Accordingly negotiations were entered into with the Secretary of State for the Air as a result of which the following arrangement was come to :—

1. The Royal Air Force agreed to furnish the Minister with a Nominal Roll of Canadians in the Royal Air Force, and to advise him from time to time of all accretions to and deductions from it.
2. All Canadians in the Royal Air Force were to be permitted to wear a Canadian badge either on their shoulder straps or on their sleeve.
3. It was agreed to give Canadians representation on the Royal Air Force Headquarters and Staff.
4. A monthly statement of the exploits of Canadian Airmen was to be furnished to the Minister, with a view to its dissemination to the Canadian public.

## Notes on "Civil Aviation"

5. It was agreed in principle that Canada should have a Flying Corps of her own, which, while distinct in its organisation and administration, would form part of the Royal Air Force for the purpose of operations in the Field.

As a result of the above the position of Canadians in the Royal Air Force was put on a basis more satisfactory to the Canadian public, as well as to the officers themselves. It will be observed that the question of forming a separate Canadian Air Force was taken up at this time, and certain proposals agreed to. The Section succeeding this deals with that subject.

### Canadian Air Force <sup>107</sup>

In 1918 the question of forming a Canadian Air Force, distinct from the Royal Air Force, occupied the attention and received the careful consideration of the Minister. Previous to this year, for various reasons, it had not been considered in the best interests of Canada or the Empire as a whole to enter on a separate programme in this connection. As the war proceeded, and as it became apparent that a Flying Corps would be an essential and important part of any Canadian post-bellum military organisation, as well as likely to have a considerable influence on the development of commercial aeronautics in Canada after the war, it was resolved to take such steps as were necessary to provide Canada with, at least, a nucleus of such an organisation. It was fully realised that any such Force must of necessity be confined within small dimensions, because any attempt to withdraw Canadian personnel from the Royal Air Force in large numbers would have had a most prejudicial effect on the efficiency of that Force. Further, the expenditure involved in the maintenance of a large Air Force would have been very great.

**As mentioned in the last Section**, this matter had been the subject of discussion between the Minister and the Secretary of State for the Royal Air Force in the early part of 1918, and it had been agreed in principle between them that Canada should have a Flying Corps of her own.

This was immediately followed up by further negotiations, and a memorandum setting out tentative arrangements for the organisation of a Canadian Air Force was drawn up between the Minister and the Secretary of State for the Royal Air Force, and definitely settled July 8, 1918.

This memorandum was later embodied as part of the Order in Council which, subsequently, confirmed the agreement.

The provisions of the Order in Council were substantially as follows :

—

- (a) That authority be granted for the formation of a Canadian Air Force and of Service Units of such Air Force in accordance with the terms of the memorandum marked "A," which memorandum had been approved by the Secretary of State of the Royal Air Force.
- (b) That further Service Units of said Canadian Air Force be formed from time to time as and when the same might be approved by the Minister of Overseas Military Forces of Canada and the Secretary of State for the Royal Air Force.
- (c) That the Canadian Air Force form a part of the Overseas Military Forces of Canada and be subject to the provisions of the Militia Act of Canada.
- (d) That the Canadian Air Force be under the same establishment as may from time to time obtain in the Royal Air Force.
- (e) That the Minister of Overseas Military Forces of Canada be empowered from time to time to take any and all action that he might deem necessary for the formation, extension, organisation, and administration of the Canadian Air Force.

Provisions of Memorandum.—

The memorandum referred to, provided [inter alia / **among other things**]

- 1. That the formation of two Canadian Air Squadrons should be proceeded with forthwith.
- 2. That these Squadrons should be organised in England by the Overseas Military Forces of Canada in conjunction with the Royal Air Force.
- 3. That the type of Unit and equipment should be decided by the Air Council.
- 4. That the personnel of the Squadrons should be drawn as follows :— \*
- (a) Officers. From officers of the Overseas Military Forces of Canada who are seconded to the Royal Air Force and who were recommended by the Air Council ; and from officers of the Royal Air Force who were Canadian citizens and who are available and recommended for release by the Air Council, such released officers to be replaced at once by Overseas Military Forces of Canada.

---

<sup>107</sup> A. E. KEMP. REPORT of the "MINISTRY of Overseas Military Forces of Canada" pages, 1918 349 - 354 - LONDON : PRINTED BY AUTHORITY OF THE MINISTRY, OVERSEAS MILITARY FORCES OF CANADA.

## Notes on "Civil Aviation"

(b) Other Ranks. By the transfer of other ranks of the Royal Air Force who were Canadian citizens and who can be released by the Air Council ; and by enlistment, or transfer from other Canadian Services of men with suitable qualifications.

5. That the Canadian Government should assume responsibility for assisting in the formation of the Squadrons by the provision of necessary personnel and for the pay' and allowances of such personnel, as well as for the supply and reinforcements for Service Squadrons.

6. That the Air Council (Imperial) should assume the responsibility for the command and administration of the Canadian personnel when in a theatre of war or under training in Great Britain, and for the provision, maintenance, and replacing in all cases of machines, tools, technical equipment and supplies necessary to maintain the said Forces ; further, it was to be responsible for the necessary training facilities.

Organisation.—In accordance with the above a Canadian Air Force Section of the Canadian General Staff was created for the purpose of carrying out the organisation of the Squadrons. Steps were taken to procure the necessary personnel in accordance with the provisions of the memorandum, and a selection of officers was made, representative of the best traditions of Canadian aerial fighting. The other ranks were selected from Units of the Overseas Military Forces of Canada, special attention in the selection being paid to their civil occupation, so that the men most suited to mechanical work might be obtained. The types of Squadrons decided upon were a single-seater Scout Squadron and a day Bombing Squadron. These were organised in England, and when organised went into quarters at Upper Heyford, near Oxford. It was, of course, intended that these Squadrons should be trained and sent to France to take their place in the field as fighting Units.

Training.—Their training proceeded along the lines necessary to prepare them for that purpose, but as a result of the signing of the Armistice they were not required in France and their training was then specially directed to fit them for post-war flying, and to giving them instruction in other branches of aeronautics likely to prove beneficial to Canada in the future. Special attention was paid to wireless training, photographic training, aerial geographical training and cross-country flying. In addition, steps were taken to complete the organisation of the Canadian Air Force so that, though small, it might provide a fully-developed organisation on which might be based any future organisation in Canada.

To effect this the following establishment has been authorised :

- i. A Director of Air Service, who will be the Officer Commanding the Canadian Air Force and will advise the General Staff on matters relating to it. He will have to assist him in his duties a Staff Captain, and a Staff Lieutenant along with four other ranks.
- ii. A Wing Headquarters consisting of a Lieutenant- Colonel, who will have command of the two Squadrons, and who will have to assist him in his duties a Captain for administration, a Captain for technical duties, and a Lieutenant for armament along with five other ranks.
- iii. No. 1 Squadron (a Scout Squadron) consisting of 18 aeroplanes commanded by a Major with three Captains, Flight Commanders, and 18 Flying Officers of the rank of Lieutenant. In addition, one administrative and one technical Lieutenant are provided for. The other ranks for this Squadron total 159.
- iv. No. 2 Squadron (a Day Bombing Squadron) consisting of 18 aeroplanes with one Major Commanding, three Captains, Flight Commanders, 18 Flying Officers with three additional officers and 160 other ranks.
- v. A Technical and Suppty Branch consisting of a Headquarters, Technical Branch and a Supply Depot. The work of this Branch is described in part in the Section which follows—the Bureau of Aeronautical Information established in the summer of 1918 having been absorbed into this Branch.

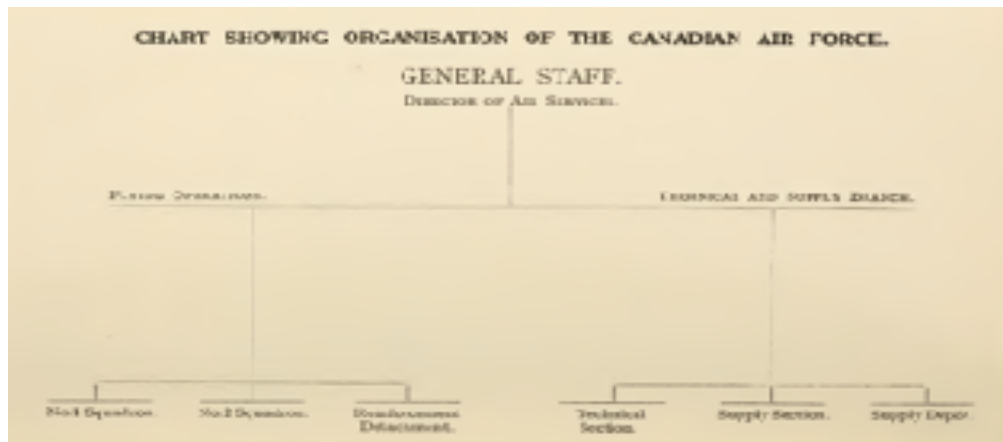

Bureau of Aeronautical Information (now absorbed in Technical and Supply Branch of Canadian Air Force).

In the summer of 1918 a small section was formed known as the Canadian Bureau of Aeronautical Information. It is now absorbed in the Technical and Supply Branch of the Canadian Air Force.

Its object was and is to collect all available technical information regarding the development of aeronautics during the war, both from Allied sources, and where possible from enemy sources.

It was seen that there was a large amount of valuable information on this subject, which could be collected during the progress of the war, but which would not be so easily obtained once peace had been signed and the aerial forces of the allies completely demobilised.

The work done consists of the collection and filing for future reference of drawings, plans, specifications, and all other technical information and data regarding aeroplanes, engines, accessories, and aircraft equipment in general.

This information should be invaluable to Canada after the war, not merely from a military point of view, but for the purpose of the aeronautical development generally, which will, without doubt, become a matter of great importance in the future.

To achieve the objects of the Bureau, it entered into arrangements with the Air Ministry whereby its representatives are allowed free access to the Technical Departments concerned, in order to make known its requirements, and to obtain any documents, publications, drawings, etc., which may be considered of value. In addition, a few officers have been sent on missions to France and Italy, to gather as complete information as possible regarding aeronautics in these countries.

Plans are on foot for the purpose of coming to an arrangement with the Air Ministry under which future aeronautical students from Canada may receive their final training as aeronautical engineers at the leading aeronautical establishments in the United Kingdom.

#### Present Equipment.—

The following equipment has been secured without charge for the Canadian Air Force in the manner indicated.

#### Aeroplanes.

Presented by the Imperial Air Fleet Committee. : 3

Presented by the Overseas Club and Patriotic League . . . . . 16

German aeroplanes in serviceable condition allotted by the Air Ministry . . . . 40

In addition 50 Curtiss machines have been presented to the Canadian Government by the Imperial Munitions Board, giving altogether a total of 109 machines available for the Canadian Air Force when it returns to Canada.

**“The short-lived Canadian Air Force...had been left in limbo by the Armistice.”**

By February 5, 1920, the two CAF squadrons (still cooling their heels overseas) had been disbanded and their personnel sent back to Canada.

5 August 1918 : Order-in-Council (UK or Canada?) establishes the “Royal Naval Air Service Canada”.<sup>108</sup>

15 August 1918 : British aviators brought down 339 German machines, and dropped 320 tons of bombs on enemy batteries and ammunition dumps during the past week.

22 August 1918 : a CAF detachment was formed at the school of Technical Training at Halton, England, to train the required ground crew for two Canadian squadrons (one a fighter squadron and the other a bomber squadron)

27 August 1918 : Ottawa to Dundas air-mail : In order to test the practicality of using aircraft to carry mail, the Post Office Department authorized three experimental Royal Air Force flights between Toronto [Dundas] and Ottawa in August 1918. There was no stamp issued for the first flight.

CLP 1 was mainly used on the second flight.

CLP 2 was issued for the third flight: it was similar to CLP 1,

CLP 2 had a value of 25 (cents) inserted in the bottom corners.

28 August 1918 : RNAS-C Dartmouth begins gearing up for operations six HS-2Ls. (Limited flights - not fully operational)

29 September 1919 : RNAS-C Sydney begins gearing up for operations six HS-2Ls. (Limited flights - not fully operational)

## Notes on "Civil Aviation"

22 August 1918 : CAF detachment RAF formed at the school of Technical Training at Halton, England, to train the required ground crew for the two "Canadian" squadrons. (Fokker D.VII fighters were taken over by the Canadian Air Force in England in 1919. Many were later sent to Canada (Fokker D. VII ser. nos. 8482/18, 8493/18)

Maj A.E. McKeever, CO No. 1 Sqn, CAF, Upper Heyford, UK, 1919 with Fokker D. VII with CAF markings. MIKAN No.339044, Major W.G. Barker, V.C. at Hounslow Aerodrome, UK, April 1919 with Fokker D.VII, MIKAN No. 3214714, Fokker D.VII (ser. no. 8493/18) No 1 & 2 Sqn, CAF, Upper Heyford, UK, 1919, MIKAN No. 3390430  
1919 : Sopwith Dolphin E4764, D5263, in service with the Canadian Air Force, England (MIKAN No.3390997)  
1919 : Sopwith Snipe, No. 1 & 2 Fighting Sqn, Canadian Air Force, Upper Heyford, England, 1919 (MIKAN No.3391011)

After the Armistice was signed in November 1918, Canada claimed 22 Fokker airplanes as trophies of war and for research and display.

Fokker D.VII A1b (Serial No. 6810/18) currently displayed at Brome County Historical Society (BCHS), 130 Lakeside Road.130 Lakeside Road., Knowlton, Quebec.

February 1917 : the first aircraft that the Canadian government retained for historical significance was a 1915 "Nieuport 12" (Nieuport Serial No. N-11504), (A4737) one of only two known to exist worldwide, a gift to Canada from the Government of France transported from France to Halifax by steamship it was exhibited across North America by the War Trophies Board to raise public support for the war effort.

1919 : Raf B.E.2d (Serial No. 5878) of 1915 vintage is sent to Canada as a war trophy.

04 September 1918 : Hoffer Motor Boat Co. (owned by J.B Hoffer) H-2 hydroplane built for the Dept of Lands and Forests crashes into a house, Bute Street, Vancouver, BC

05 September 1918 : A Royal Naval Air Service "in Canada" is approved by the Canadian government. The service is to be formed for home defence. It never sees active service.

1. 64 cadets are selected in September and sent to the Massachusetts Institute of Technology for the ground school instruction <sup>109</sup> that would precede flight training.
2. A dozen more cadets and six RCN ratings were posted to Britain to commence airship training.<sup>110</sup>

19 September 1918 the Canadian Privy Council approved the formation of the CAF in England, comprised of two squadrons and a CAF Directorate of Air Services. This directorate was a branch of the General Staff of the Overseas Military Forces of Canada.

<sup>111</sup>Lieutenant-Colonel William Avery "Billy" Bishop is the first commander of the CAF in England.

5 September 1918 the Royal Canadian Naval Air Service was approved by the Canadian government. Personnel were to be trained on lighter-than-air airships (dirigibles) and heavier-than-air airships (aircraft). By the signing of the armistice, the RCNAS had 81 cadets of whom 60 were under going training in the United States, with 13 in the United Kingdom and eight in Canada awaiting training. Additionally, six coxswains had enlisted for airship duties and were serving in the United Kingdom. (A History of the Air Services in Canada - Don Nicks)

December 1918 : Handley Page has produced 103 "large" aircraft.

5 December 1918 : RCNAS disbanded and all cadets and coxswains demobilized (A History of the Air Services in Canada - Don Nicks)

19 September 1918 : **A distinct "Canadian" branch of the Royal Air Force was authorized (see meeting re winnipeg june 3rd 1920)** . Two British squadrons designated No. 1 (Fighter) Squadron and No. 2 (Day Bomber) Squadron, and posting of Canadians to these units began. - See more at: <https://legionmagazine.com/en/2015/06/canadian-flyers-go-to-war/#sthash.Nujh0vay.dpuf>

## Notes on "Civil Aviation"

28 September 1918 : The Essential Characteristics of Successful and Unsuccessful Aviators with Special Reference to Temperament," by Capt. T. S. Rippon, M.R.C.S., L.R.C.P. (Lond.), R.A.M.C, attached R.A.F, and Lieut. E. G. Manuel, R.A.F, which were published in the Lancet.

October 1918 : High Trenchard appointed commander of the Inter-Allied Independent Air Force in recognition of his close relationship with Americans and the French Air Force.

03 October 1918 : Lancet Scientific report published in FLIGHT : THE TEMPERAMENT OF AVIATORS : " The Essential Characteristics of Successful and Unsuccessful Aviators with special reference to Temperament," by Capt. T. S. Rippon, M.R.C.S., L.R.C.P. (Lond.), R.A.M.C, attached R.A.F, and Lieut. E. G. Manuel, R.A.F.

The enormous number of pilots who have, qualified recently is a proof that the aviator is not a " super-man." It is true that we see certain men who perform marvellous " stunts," but when we come to talk to them and examine them with regard to physique and mentality we find that they are quite ordinary people. Flying is not now confined to the public school boy, the cavalry officer, or the athlete. We take many of our pilots at present from the lower middle classes and some from the artisan class.

Character.—He possesses resolution, initiative, presence of mind, sense of humour, judgment ; is alert, cheerful, optimistic, happy-go-lucky, generally a good fellow, and frequently lacking in imagination.

We found that the best type of pilot was seldom drawn from a sedentary occupation, that those who had lived a sheltered life were not so good as those who had roughed it, and we discovered the interesting fact that most pilots, before they joined, were in business or doing clerical work and possessed considerable sporting aptitude, and as soon as they had finished work would hurry to the cricket or football field.

"The fighting scout" —The fighting scout is usually the enthusiastic youngster, keen on flying, full of what one might call the " joy of life," possessing an average intelligence, but knowing little or nothing of the details of his machine or engine ; he has little or no imagination, no sense of responsibility, keen sense of humour, able to think and act quickly, and endowed to a high degree with the afore-mentioned quality, " hands." He very seldom takes his work seriously, looks upon " Hun-strafting " as a great game.

Mechanical knowledge. —The question whether this type should possess a knowledge of mechanism, and of the whys and wherefores of flying, is a very debatable point.

The authors, however, desire to express their definite conviction that the less the fighting scout pilot knows about his machine from a mechanical point of view the better.

From the very nature of his work he must be prepared to throw the machine about, and at times subject it to such strains that did he realise how near he was to the breaking-point, his nerve would go very quickly.

It has not been possible as yet to obtain a sufficient body of evidence in support of this statement, owing to the unwillingness of pilots to confess their ignorance of engines, for reasons of amour-propre. Some of the most experienced and prominent pilots of the present day, however, uphold our conviction.

The authors have also circulated other questions among pilots with a view to eliciting information on such points as What is the essential characteristic of a good pilot ? &c. On the subject of the physical and psychological aspects of flying they state that the physical condition should always be compared with the temperament of the individual, but the physical examination should always be preceded by the psychological.

November 1918 : air strategy in the 1920s, let us analyse a RAF proposed peace strength chart (Appendix 1), as laid down by the Chief of the Air Staff in a November 1918 paper. Figure 1 below, which is drawn from this Appendix, illustrates the proposed location of the squadrons. Most significantly, the Figure expounds the increasing importance placed by strategists on using air power in the empire, with **34 squadrons placed in colonial possessions**.

The Chief enthused that 'British possessions...are spread over a wide area and aircraft should prove of the greatest service'.

Aircraft were seen as a form of control without occupation, providing a cheap and ubiquitous means of imperial policing.

He (Chief) also opined that 'on the conclusion of peace all available aircraft material should be utilised...in the Dominions and India'.

November 1918 : United States : By the end of the war 300 US factories were manufacturing airplanes and engines. 175,000 workers were employed. Potential output of 21,000 aircraft per year. Between April 1917 and November 1918, US industry delivered 13,844 aircraft and 41,953 engines.

November 1918 : 27 Air Ministry A.I.D Aeroplane Acceptance Parks are in operation for final assembly and acceptance of new aircraft from the factories before delivery to operational squadrons. A number of Aircraft Repair Depots were also built geographically (in UK / France?) to carry out major repairs to enable aircraft return to the Air "Service" (CRS). Air Ministry A.I.D staff is 10,657 persons (not including in-the-field technical officers of the RFC / RNAS "On the Ground").

AID is the only aeronautical department created before the war to have survived it with its identity, organization and senior personnel substantially unchanged. The A.I.D substantially fulfilled its aims to:

1. ensure reliability of British aircraft by development and maintenance of quality standards,
2. foster increased aeronautical production,
3. improve aeronautical equipment.

The British aircraft industry as of the Armistice 1918:

- A. Extremely efficient
- B. Highly developed techniques for manufacture, inspection and repair
- C. Highly Trained and educated personnel (& tiered levels of responsibility)
- D. Excellent research & development facilities
- E. Large capacity for production

November 11, 1918 : WWI Armistice : Hostilities ceased at 11 o'clock. The Royal Air Force at the end of the First World War numbered 30,000 officers and 350,000 other ranks. The first-line strength of the RAF was 3,300 aircraft and 103 airships.

November 1918 : Within days of signing the armistice, the United States cancels \$100,000,000 in contracts for military aircraft and parts, cutting the US aircraft industry to an estimated ten percent of its wartime size. US manufacturing delivered 14,000 aircraft in 1918 (to a low of 263 in 1922). The United States - NACA annual report for 1918 recommends:

- A. Federal legislation to promote and regulate civilian and commercial aviation.
- B. Formation of a committee in conjunction with other government agencies concerned with aviation: the War, Navy, Commerce, and Post Office Departments - the Special Interdepartmental Conference on Aerial Navigation.

The issues:

1. What action should be taken to ensure a healthy aviation industry:
  1. as a commercial enterprise worthy in its own right and
  2. as a reliable source of military aircraft in the event of war?
2. As a means of transportation, how much regulation did flying require to make it:
  1. safe,
  2. attractive,
  3. profitable
3. What organization of government agencies would be most conducive to these ends?
  1. Disagreement on this question is intense, divisive, and bitter.
  2. This question delays passage of civil-aviation legislation for more than seven years.

## Notes on "Civil Aviation"

President Wilson endorsed this recommendation and forwarded it to Congress on 26 February 1918.

April 1919, Dr. Ames reported that:

1. reported that the great public interest in the subject demanded "much study" of it.
2. recommended the appointment of a "strong subcommittee" to make an "extensive study" of the matter. This suggestion won quick endorsement, but it was not until 25 November, after the end of the first session of the 66th Congress, that the Committee got around to appointing the Special Committee on Organization of Governmental Activities in Aeronautics, with Joseph S. Ames as chairman. Thereafter, things moved more quickly. Ames began gathering data and opinions from the United States and abroad. By early December, he had
3. concluded that the European experience clearly demonstrated what not to do:
4. do not form a central department of aeronautics as the British had done in their Air Ministry.

Carrying great weight with Ames was a recent report by Captain H.C. Mustin, a member of the Crowell commission that visited Europe in 1919 to study the aviation lessons of the war.

Ames stated he found "conclusive arguments against combining all aviation work in a central bureau or department" in Capt. Mustin's report. - A scientist, Ames takes umbrage at **the UK's placing of the scientific work under the control of "The Factory"**

This position soon solidified into a tenet of NACA policy - against combining all aviation work in a central bureau or department

(ref : NASA Archive : Ames to Walcott, 11 Dec. 1919, enclosing "Extracts from Report of Captain H.C. Mustin, U.S.N., to the Secretary of the Navy, on the Subject of Aviation Organization in Great Britain, France, and Italy." On Ames's search for information, see, for example, Ames to William Knight, 2 Dec. 1919, in 57 A 415 (66), 51471 19 1920.)

Mustin's evaluation placed emphasis on the question of aeronautical research.

It should be noted that the Crowell commission (of which Mustin was a member) generally endorsed the British model.

Billy Mitchel noted that the USN was trying to duplicate everything - the Crowell commission was in place during the demob post WW1.. they did not truly see all of the work done and the UK AM was already in place - and being cut... the Crowell commission / American Aviation Mission (Flight International has details) returned home in July 1919. The American Aviation Mission recommended that oversight of all aviation activities Military, naval and civilian be concentrated within a single dept of aeronautics - similar to the British. ( see and read : Billy Mitchell's War with the Navy: The Army Air Corps and the Challenge to Seapower - Thomas Wildenberg)

11 November 1918 : Armistice signed ending WW1.

11 November 1918 : Formation of the remaining 6 CAF squadrons UK terminated.

11 November 1918 : Armistice renders RNAS-C redundant

20 November 1918, No. 1 Squadron CAF (fighter) was formed at Upper Heyford, Oxfordshire, England - Sopwith Dolphins / S.E. 5a.

25 November 1918 : No. 2 (day bombing) Squadron CAF formed at Upper Heyford, Oxfordshire, England - deHavilland DH9

27 November 1918 : Canadian Senator George G. Foster of Knowlton, Ontario (George Buchanan Foster, Senator Foster's son was a RFC pilot who survived the war) sends a written request for unspecified "war trophies" to Dominion Archivist Col. A.G. Doughty. A month-long correspondence between the two men followed, and an agreement was made; the Brome County Historical Society would be the recipient of a Fokker D.VII plane if a building suitable for its display and safe keeping could be erected. in the summer of 1921, at which time the promised plane was shipped, in pieces, from Ontario's Camp Borden.

The shipping cost was \$125 and there was some delay in procuring someone qualified to assemble it.

Records indicate that the plane sent to Knowlton was one of 22 planes acquired by Canada as souvenirs of the war.

**McGill University, Acadia University and other educational institutions received the planes as gifts.**

The biplanes were promptly taken apart and studied.

**November 1918 : RAF strength 188 Sqns, 23,000 aircraft with service 291,000 persons (Men and Women)**

**November 1918 : John Armistead Wilson paper "Notes on the Future Development of the Air Service in Canada Along Lines Other Than Those of Defence." See more at: <https://legionmagazine.com/en/2004/09/the-imperial-gift/#sthash.1ZCw3UB7.dpuf>**

## Notes on "Civil Aviation"

- urged the government to embark on a national air policy, involving both regulatory functions and active flying operations.
- stressed that Canada's postwar flying would have to be focused on civil aviation

November 1918 : Major Clare C. MacLaurin report "Memorandum Regarding the Formation of a National Canadian Air Service".

- urged the government to embark on a national air policy, involving both regulatory functions and active flying operations.
- stressed that Canada's postwar flying would have to be focused on civil aviation See more at: <https://legionmagazine.com/en/2004/09/the-imperial-gift/#sthash.1ZCw3UB7.dpuf>

November 1918 - PRINTED BY ORDER OF PARLIAMENT, OTTAWA 1920 : TREATY OF PEACE BETWEEN THE ALLIED AND ASSOCIATED POWERS AND BULGARIA AND PROTOCOL SIGNED AT NEUILLY-SUR-SEINE NOVEMBER 27, 1919 For this Purpose, the HIGH CONTRACTING PARTIES have appointed as their plenipotentiaries : His MAJESTY THE KING OF The United KINGDOM OF GREAT BRITAIN AND IRELAND and OF THE BRITISH DOMINIONS beyond the seas, EMPEROR OF INDIA:

Mr. Cecil HARMSWORTH, M. P., UnderSecretary of State for Foreign Affairs ;

Sir Eyre CROWE, K.C.B, K.C.M.G Minister Plenipotentiary, Assistant Under-Secretary of State .for Foreign Affairs;

and for the DOMINION OF CANADA: The Honourable Sir George Halsey Perley, K.C.M.G., High Commissioner for Canada in the United Kingdom.:

### ARTICLE 91.

Until the complete evacuation of Bulgarian territory by the Allied and Associated troops the aircraft of the Allied and Associated Powers shall enjoy in Bulgaria freedom of passage through the air, freedom of transit and of landing.

### ARTICLE 92.

During the six months following the coming into force of the present Treaty the manufacture, importation and exportation of aircraft, parts of aircraft, engines for aircraft, and parts of engines for aircraft shall be forbidden in all Bulgarian territory.

### ARTICLE 93.

On the coming into force of the present Treaty all military and naval aeronautical material must be delivered by Bulgaria and a\ her expense to the Principal Allied and Associated Powers.

Delivery must be effected at such places as the Governments of the said Power's may select, and must be completed within three months.

In particular, this material will include all items under the following heads which are or have been in use or were designed for warlike purposes :

1. Complete aeroplanes and seaplanes, as well as those being manufactured, repaired or assembled.
2. Dirigibles able to take the air, being manufactured, repaired or assembled.
3. Plant for the manufacture of hydrogen.
4. Dirigible sheds and shelters of every kind for aircraft.
5. Pending their delivery, dirigibles will, at the expense of Bulgaria, be maintained
6. inflated with hydrogen ; the plant for the manufacture of hydrogen, as well as the sheds
7. for dirigibles, may, at the discretion of the said Powers, be left to Bulgaria until the
8. time when the dirigibles are handed over.
9. Engines for aircraft.
10. Nacelles and fuselages.
11. Armament (guns, machine guns, light machine guns, bomb-dropping apparatus,
12. torpedo-dropping apparatus, synchronization apparatus, aiming apparatus).
13. Munitions (cartridges, shells, bombs loaded or unloaded,
14. stocks of explosives or of material for their manufacture).
15. Instruments for use on aircraft.
16. Wireless' apparatus and photographic or cinematograph apparatus for use on aircraft.
17. Component parts of any of the items under the preceding heads.

The material referred to above shall not be removed without special permission from the said Governments.

## Section IV

Inter-Allied Commissions of Control.

## Notes on "Civil Aviation"

### ARTICLE 94.

All military, naval and air clauses contained in the present Treaty for the execution of which a time limit is prescribed shall be executed by Bulgaria under the control of Inter-Allied Commissions appointed for this purpose by the Principal Allied and Associated Powers.

The above-mentioned Commissions will represent the Principal Allied and Associated Powers in dealing with the Bulgarian Government in all matters concerning the execution of the military, naval and air clauses.

They will communicate to the Bulgarian authorities the decisions which the Principal Allied and Associated Powers have reserved the right to take or which the execution of the said clauses may necessitate.

### ARTICLE 100.

It will be the special duty of the Aeronautical Inter-Allied Commission of Control to make an inventory of the aeronautical material which is actually in possession of the Bulgarian Government, to inspect aeroplane, balloon and motor manufactories and factories producing arms, munitions and explosives capable of being used by aircraft, to visit all aerodromes, sheds, landing grounds, parks and depots situated in Bulgarian territory, and to authorise where necessary the removal of material and to take delivery of such material.

The Bulgarian Government must furnish to the Aeronautical Inter-Allied Commission of Control all such information and legislative, administrative or other documents which the Commission may think necessary to ensure the complete execution of the air clauses, and in particular a list of the personnel belonging to all Bulgarian air services and of the existing material, as well as of that in process of manufacture or on order, and a complete list of all establishments working for aviation, of their positions and of all sheds and landing grounds.

December 1918, Canadians were inquiring about availability of airships "to carry mails, government officials and survey unexplored parts of the country, etc." The British Admiralty was prepared to supply six, but observed that such craft had a life expectancy of only six months. By March 1919, Canadian Air Force officers were asking about heavier-than-air machines. Meanwhile, with large stocks of surplus aircraft on hand, Britain's air ministry was cancelling production orders while looking about for ways to dispose of surplus material. The Imperial Gift helped assuage the embarrassment of destroying serviceable aircraft, estimated in the thousands. - See more at: <https://legionmagazine.com/en/2004/09/the-imperial-gift/#sthash.1ZCw3UB7.dpuf>

1918-1919: In England William Avery "Billy" Bishop (DFC-1918) begins ground work on organising a Canadian Air Force. It is noted that bishop had At the termination of a very unsuccessful academic career joined the Mississauga Horse and at the outbreak of the war was a cavalry Lieutenant. in his final two weeks in combat he shot down an incredible twenty-five enemy aircraft, twelve coming in the last three days After this feat, Bishop was posted to a staff job as he was now considered a valuable war symbol. His secondment to the RAF was terminated and he was attached to the Canadian Headquarters Overseas as a temporary Lieutenant-Colonel. won the Commonwealth's highest award for valour, "the Victoria Cross"

**1 October 1918 : Raymond Collishaw (of Nanaimo, British Columbia) who disregarded Military rules, was third overall allied ace - withdrawn from the front, promoted to Lieutenant-Colonel and posted to aid the formation of the CAF**

The survival of military aviation - if it was to survive needed an in.. a "back door" The manner in which the Army leadership exercised command over, and directed aviation policy and professional standards affecting career pilots is examined in the contexts of the contrasting preparations for war of the Army and the Government. the air element has traditionally constituted a very minor proportion of the total personnel - about 10% at the maximum. neither the state's air nor naval forces are represented by appropriately qualified staffs at DOD or the DFHQ. To a certain extent, reflecting this cultural imbalance, the main historical works of recent times have largely ignored air aspects of defence policy and practice.

To a major degree this imbalance in military historiography is a reflection of the cultural imbalance evident in successive Defence Forces handbooks and the manner in which the Air Corps has been presented. Produced and edited by a succession of Army officers these handbooks have generally presented a brief and somewhat simplistic and inaccurate picture of the history and heritage of military aviation. The most recent handbook (1988), in the course of a feature on the training schools of the Defence Forces, makes no reference to the Flying Training School that has been in existence at Baldonnell since 1922. Similarly no reference was made to the Air Corps Apprentice School that was set up in 1936, the fore-runner, by twenty years, of the Army Apprentice School. It is, however, considered that successive generations of Air Corps flying officers have been somewhat remiss in failing to

## Notes on "Civil Aviation"

foster a better historical awareness. Traditionally, flying officers, while progressive and up-to-date in professional and technical matters, have not been aware of or shown any great interest in their aeronautical past and roots. With only a single exception to date the leadership of the corps have, in terms of historiography as in terms of projecting a unique military culture and ethos, remained meekly subservient to the dominant infantry culture of the forces. The resultant subjugation of the history of military aviation requires to be reversed by way of a comprehensive and objective study. it might also be considered that the very deliberate action of Collins, in initiating a relatively small military air arm to conduct intelligence gathering activities, escaped the scrutiny of without detecting his considerable involvement with the early months of the country's civil and military aviation. one must comment on Donai MacCarron's book on Irish military aviation, Wings over Ireland, principally because it is the only substantial one that purports to tell the story of the Air Corps (for the period 19?? to ????) identify the reasons for the lamentable lack of policy and preparation. Neither does the author identify the cultural chasm between the Army and the Air Corps that should have been obvious at the time. the relationship that developed between his artillery corps commanding officer and the British air attach and the resultant cooperation with the RAF. the Royal Engineers are not generally listed in the subject index under 'aviation' and mostly only mentioned in passing in other aviation related entries. (MILITARY AVIATION IN IRELAND 1921- 1945 By MICHAEL O'MALLEY)

A/M = Air Ministry.

AM = Air Ministry.

AM E = Air Ministry Examiner??

**22 Aug 1918** - a Canadian Air Force detachment was formed at the RAF School of Technical Training, Halton, England, to train Canadian mechanics for two proposed "all-Canadian" squadrons in the RAF.

**11 Nov 1918** - Armistice ends the Great War. About 22,000 Canadians had served in the RFC, RNAS and RAF; 1,562 gave their lives, and over 800 were decorated for their services. At the cessation of hostilities large body of trained Air Engineers was available, but there was no peace-time position for them as Civil Aviation had no such positions <sup>112</sup> Canada had no Air Organisation - service or Civil source <https://archive.org/stream/transactionsofen19engi#page/68/mode/2up/search/Air+Engineers> - Engineering journal 1934

December 1918 : Handley Page produces 211 large aircraft

December 1918 : Prime Minister David Lloyd George offered Winston Churchill his choice of appointments as either head of the Admiralty or the War Office. He chose the former, but was given the latter. Lloyd George then told him that he would also be appointed Secretary of State for Air – the political head of the Air Ministry and the RAF .

9 December 1918 : UK - Memorandum by the Chief of the Air Staff Frederick Sykes on Air-Power Requirements of the Empire. Sykes conceptualized the British realm as being held together by a large network of government aviation, with little commercial privatization. In his scheme, the Air Ministry would take up the responsibility of policing operations, postal duties, and an assortment of other public obligations. Additionally, he recommended that home defense consist of twenty squadrons with a cadre of regular commanders; these units would include eight squadrons of day bombers, nine squadrons of night bombers, and three squadrons of flying boats RAF units would be required to discharge coastguard responsibilities, perform all other government aerial obligations, balloon and airship services, as well as undertake surveying, anti-aircraft, and sound-locating duties.<sup>26</sup> He noted that geographical boundaries no longer offered security; therefore, forces should maintain a state of readiness throughout the empire – the Dominions would also be required to maintain squadrons (The Dominions would maintain 37 squadrons – Canada 12, Australia 10, South African 9, and New Zealand 6 ) the meager defense budget could not accommodate Sykes' ambitious plans, and the previous "scheme" (Programme) was never developed by the Air Ministry. This inability to conceptualize the needs of the air service led some within the top echelon of the Ministry to believe that Sykes was unsuitable in his position as CAS, and as a result should be replaced - there is virtually no mention of finance.

The national response to war also led to a national interest in the provision of education.

As the state took more and more control of the levers of industry and services, so it increased its participation in the provision of education.

In 1918, the Fisher Act took educational responsibilities for Secondary Education away from Local Education Authorities and put it directly in the hands of the central government.

---

<sup>112</sup> The Engineering Journal pg 56 , February 1936 : <https://archive.org/stream/transactionsofen19engi#page/56/mode/2up/search/Air+Engineers>

## Notes on "Civil Aviation"

It also increased the age of leaving for all students to 14. The British government had been impressed with the calibre of German soldiers who had been taught far more systematically and for longer than the British soldiers had been. It was also felt that the modern battlefield and economy would require better skilled and trained people to man them.

However, despite attempts to take more control over the provision of education, the effects of the Great War would be long lasting and traumatic for many years to come.

Few families in Britain had not been touched by the war.

A generation of teachers would enter their profession scarred by memories of the war, whether directly or indirectly.

Many teachers vow to "veer away from unthinking patriotism" and began to teach a more critical approach to the 'national story'.

Although not a British book, Erich Remarque's '[All Quiet on the Western Front](#)' published in the 1920s gives a nice example of this transition when German soldiers recall the proud patriotic history taught to them by their teacher and compared it to the horrors that they actually faced on the battlefield.

This kind of transition was happening across Europe and also in Britain.

05 December 1918 : RNAS-C disbanded

late 1918 : co-operating with Major Clare C. MacLaurin, John Armistead Wilson begins formulating a postwar aviation policy for Canada.

points to note:

1. Ministers of the Crown were almost as indifferent to aviation in 1919 as they had been in 1913.
2. several groups, including forestry associations, were urging adaptation of aircraft to civil ends, while surveyors and mining officials
3. Other than as a pool of talent and a conduit to British aviation, the shiny CAF in England would be irrelevant.
4. Canada's postwar flying would have to be focused on civil aviation.
5. A national air policy, involving both regulatory functions and active flying operations.
6. domestic air organization would have to be built from scratch, an air force could follow, linked to commercial flying much as the Royal Navy was associated with the Merchant Marine.
7. seaplanes would initially be more useful in the Canadian context than land planes
8. Wilson was assigned the task of writing the Air Board Act.
9. Wilson's vision : A strong civil air industry supporting the RCAF.
10. Key point in Wilson's policy (Air Board) was the institution of airmail (1927) with the post office subsidizing numerous companies through mail contracts. (RCAF cancelled the airmail contracts in 1931-32, a crippling blow to Canadian civil aviation - the air force then began operating a limited airmail service in the lower St. Lawrence Valley.)
11. Wilson completed the first draft of the Air Board Act in two days.
12. Wilson's draft of the Air Board Act was introduced into the House of Commons on April 29, 1919.
13. Wilson's draft of the Air Board Act received royal assent on June 6, 1919.
14. Wilson's Air Board Act
  1. staked out aviation as the exclusive preserve of the national government and not the provinces.
  2. view of aviation as the exclusive preserve of the national government and not the provinces remained unchallenged until 1927.
  3. view of aviation as the exclusive preserve of the national government and not the provinces accepted by the highest courts in 1932.

A. John Armistead Wilson

1. Born in Scotland in 1879,
2. trained as an engineer, (Civil?)
3. moved to Canada in 1905
4. director of stores and contracts for the Department of Naval Service, 1910
5. deputy minister of the Department of Naval Service, 1911
6. had virtually no contact with aviation until the formation of the RCNAs, 1918
7. outlook on aviation was forged from his experience with the Royal Cdn. Navy. "Without a solid civil foundation the navy was never able to muster the material, technological and moral support it needed to prosper; consequently, it remained an artificial construct imposed on a disinterested public, fighting a continual rearguard action for survival." an Canadian air force would lack even the limited political patronage enjoyed by the peacetime Non-Permanent Militia which was populated by weekday politicians masquerading as weekend colonels...
8. Secretary of the Air Board, 1920.

## Notes on "Civil Aviation"

9. Assistant director and secretary of the RCAF, 1923.
  10. view tallied with that of director of the RCAF Group Captain James A. Scott (May 1924 to February 1928) - Scott's objections to continuing RCAF civil operations lay in his belief that they undermined air force training and discipline by encouraging intimate contact between officers, men and civilian employees. believed that the RCAF, stripped of any civil duties, could nevertheless retain its budget and personnel establishment, that the force should be an all-military organization
  11. Controller of civil aviation, 1927.
  12. Controller of civil aviation, 1936
  13. a director of Trans-Canada Airlines, 1937
  14. largely responsible for mobilizing civil aviation as a component of Canada's war effort, 1939
  15. his Department of Transport division was tasked with choosing and developing sites for British Commonwealth Air Training Plan training bases, Dec. 17, 1939
  16. Director of air services, 1941
  17. key figure in organizing Ferry Command
  18. helped plan a Canadian government Trans-Atlantic Air Service, 1942 ( foundation for transoceanic air services by Trans-Canada Airlines)
  19. awarded the Trans-Canada Trophy, 1945.
  20. appointed a Commander, Order of the British Empire (CBE), 1946.
  21. bestowed Cross of Liberation by Norwegian government, 1948.
  22. named to the Canadian Aviation Hall of Fame, 1973
- B. Major Clare C. MacLaurin
- C. The first chairman of the board, Colonel O.M. Biggar, brought to his duties much knowledge of overseas air policies gained while attending the Paris Peace Conference as a Canadian delegate Militia Defence Department - Legal Branch to be constituted - Lieutenant Colonel O. M. Biggar to be Judge Advocate General (at \$6,000/ yr = \$103,587.59/ yr in 2016) replacing Major General Henry Smith - (On 1 October 1911, Colonel (Col) Henry Smith was appointed as Canada's first JAG. Col Smith, who was 75 years old at the time of his appointment, first joined the Militia in 1862. He had served on active service during the Fenian raids and the Northwest Rebellion, and he maintained a law practice in Cobourg, Ontario. The original JAG's mandate included maintaining court martial records, advising courts martial on matters of law and procedure, advising on the revision of the Militia Law and regulations, and providing legal advice to the Militia Department.) authority for appointment of Deputy Judge Advocate General and assistants etc - Minister of Militia and Defence "M. M. and D". 1918 Order-in-Council Number: 1918-0495 Date Introduced: 1918-02-27 Considered Date: 1918-02-27 Approved Date: 1918-02-28 Reference: RG2, Privy Council Office, Series A-1-a, For Order in Council see volume 1190, [Access Code 90](#) Note: See also 1918-0234 Register Number: Series A-1-d, Volume 2814.
- D. In 1920, Col Biggar resigned as JAG to become Canada's elections officer, and was replaced by LCol Reginald Orde. For much of the inter-war period LCol Orde was Canada's only legal officer. Despite the limited resources initially available to him, LCol Orde was responsible for militia, naval and air force law, and providing legal services with respect to discipline, pay and pensions, revising regulations and providing legal advice on general matters pertaining to the Department of National Defence (DND)

Lieutenant Colonel O. M. Biggar to be Judge Advocate General

The Judge Advocate General performs two unique statutory roles set out in the National Defence Act (NDA):

1. The Judge Advocate General is the commissioned officer, appointed by the Governor in Council, to superintend the administration of military justice in the Canadian Armed Forces [s. 9.2(1)]. In respect of that superintendence function the late Chief Justice Lamer commented that the intention of the legislative provision "“was to recognize and continue the exercise of responsibilities similar to those of the Attorney General as historically performed by the JAG under English common law”"
2. The Judge Advocate General also performs a separate function as a legal advisor to:
  1. the Governor General in matters relating to military law
  2. the Minister in matters relating to military law
  3. the Department in matters relating to military law, and
  4. the Canadian Armed Forces in matters relating to military law [s. 9.1].

## Notes on "Civil Aviation"

Canadian military law includes the law relating to the constitutionally separate system of military justice as well as the governance, administration and activities of the Canadian Armed Forces.

Military law governs the Canadian armed forces in peace and during armed conflict, at home and abroad.

The breadth of the scope of Canadian military law is reflected in the fact that the Judge Advocate General is a legal advisor to both the Department and the Canadian Armed Forces.

Designation of person to execute Minister's functions

The Governor in Council, on the recommendation of the Minister of Defense, may designate any other person in addition to the Minister of defense to exercise any power or perform any duty or function that is vested in or that may be exercised or performed by the Minister under this Act.

### THE POWER OF DELEGATION - A LONG ACCEPTED PRINCIPLE OF BRITISH PUBLIC LAW

The power of delegation is a long accepted principle of British public law.

"In the administration of government in the United Kingdom the functions which are given to post holders...are functions so multifarious that no post holder could ever attend to them"

It cannot be supposed that this regulation meant that, in each case, the [office holder] in person should direct his mind to the matter.

The duties imposed on [office holders] and the powers given to [office holders] are normally exercised under the authority of the [the office holder] by "responsible officials"

Public business could not be carried on if that were not the case.

Constitutionally, a decision of such an official is, of course, the decision of the [the office holder].

**The [office holder] is responsible.**

1. It is the [office holder] who must answer for anything that his officials have done under his authority, and,
2. if for an important matter the [office holder] selected an official representative of such junior standing that such junior officer could not be expected competently to perform the work, the [office holder] would have to answer .

The legal principle which permits delegation in this way is predicated on the proposition that the [office holder] is responsible for things done under his or her authority.

Therefore, the exercise of the delegation is dependant on two things:

1. the conferment of power must be permitted under legislation; and
2. the existence of a person to whom the [office holder] can delegate, without parting with their ultimate responsibility.

Parliament has conferred powers directly on the [office holder] *because of the personal qualifications of the individual holder* but allows the [office holder] to *delegate those other functions for which qualifications are not required in their position* at the apex of the hierarchical structure put in place to support him or her.

Those delegated functions relying on personal qualifications *can only be delegated to equivalently trained and competent office-holders.*

Whilst *a member of the [office holder] staff may be described in an instrument of delegation as a proper and appropriate agent; that person does not become "the proper and appropriate person"* as their actions under a delegation are those of the [office holder].

**Delegations must be updated with each new post holder.**

Delegated Staff members cannot exercise delegated functions unless the individual has been specifically:

## Notes on "Civil Aviation"

1. *trained to accomplish the specific delegated functions*
2. *authorised in writing* by the relevant [office holder] and
3. *authorised only to the extent indicated* by that instrument of delegation.

I NAME OF Office Holder hereby confirm that

NAME OF the MEMBER OF the OFFICE HOLDER's STAFF

Who, having been:

1. trained to Paragraph X of Schedule X of the **Deregulation and Contracting Out Act, 1994** as an officer and servant of the [office holder], as defined in section XX of the **Deregulation and Contracting Out Act, 1994**
2. examined to Paragraph X of Schedule X of the **Deregulation and Contracting Out Act, 1994** as an officer and servant of the [office holder], as defined in section XX of the **Deregulation and Contracting Out Act, 1994**, and
3. nominated further to Paragraph X of Schedule X of the XXXXXXXX Act of XXXX as an officer and servant of the [office holder], as defined in section XX of the **Deregulation and Contracting Out Act, 1994**

Is authorised by me under the provisions of Section XXX of the **Deregulation and Contracting Out Act 1994** to:

1. act in accordance with the guidelines set out in the Annexe to the Statutory Guidance on Delegations and Multiple Licence Holders in the XXXXXXXX Area up to and including the level of .XXXXXXX, and
2. make decisions in accordance with the guidelines set out in the Annexe to the Statutory Guidance on Delegations and Multiple Licence Holders in the XXXXXXXX Area up to and including the level of .XXXXXXX

Until such time as I withdraw all or any part of the delegation.

late 1918 : UK : 27 Aircraft Acceptance Parks "AAPs" are either in operation, or under construction. Aircraft Repair Depots (ARDs) were established (geographically in the UK) to carry out **major repairs** to military aircraft. Good road and rail communication and proximity to industrial centres was essential for the operation of the ARDs.

### APPLYING for AERONAUTICAL APPOINTMENTS - British Air Ministry <sup>113</sup>

The first step to be taken is to write for the necessary form and conditions of entry.

1. It is possible that by the time these lines are in print the Air Force will have come into being.
2. The re-organisation, however, is bound to be slow, so the following notes will still serve.

#### The principal appointments:

##### **1. Commissions in the Royal Flying Corps:**

1. Commissions in the Royal Flying Corps:
  1. Apply to the Director of Air Organisation, Air Board Offices, Strand, W.C. 2.
  2. Applicants for flying officers posts:
    1. must usually be between 18 and 25 years of age, with Class "A" medical certificates.
    2. Officers with military experience are sometimes accepted up to 30 years of age,
    3. Officers with military experience over 30 years of age are occasionally accepted for observers' posts only.
  3. For equipment officers, applicants must be over ?? , with medical classification equivalent to " 1 > 2" on the old scale.

##### **2. Commissions in the Royal Naval Air Service:**

Communicate with the Director of Air Services, Admiralty, S.W.  
Ages required are similar to those for the Royal Flying Corps.

##### **3. Appointment to the Air Board Staff:**

There are a limited number of openings for men whose medical classification is in the "C" category for :

1. engineering,
2. drawing office, and
3. clerical appointments.

Applications for forms should be made to the Secretary, Air Board Offices, Strand, W.C. 2.

##### **4. Appointment to the Aeronautical Supplies Department - Ministry of Munitions:**

The same remarks apply as in the case of the Air Board Staff.

Applications for the needful forms should be made to the Chief Establishment Officer, Air Board Offices, Strand, W.C. 2.

##### **5. Appointment to the Aviation Inspection Department:**

Again the same comments apply, as in the case of the Air Board.

Application Forms are to be obtained from the Director of Inspection, Clements Inn Buildings, Kingsway, W.C. 2.

Note.—In all the above cases, except for flying officers, preference is given to candidates who have had a sound engineering training and experience.

---

<sup>113</sup> source ref : UK Aviation pocketbook 1918

**6. Appointment to the Royal Flying Corps:**

Applications for enlistment should be made to the Officer Commanding, Royal Flying Corps Depot, Farnborough.

Skilled mechanics in all trades are taken, whatever their army classification.

Unskilled men are only recruited if classed as B1, B2, C1, or the equivalent.

Non-commissioned officers are promoted from within the ranks.

**Part II. - Establishment of Air Council** <sup>114</sup>

**7. Establishment of the Air Council**

1. For the purpose of the administration of matters relating to the Air Force and to the defence of the realm by air there shall be established an Air Council consisting of:
  1. one of His Majesty's Principal Secretaries of State, who shall be President of the Air Council, and
  2. of other members who shall be appointed in such manner and subject to such provisions as His Majesty may by-Order-in-Council direct.
2. His Majesty may by-Order-in-Council fix the date as on which the Air Council is to be established, and make provision with respect to the proceedings of the Air Council and the manner in which the business of the Council is to be distributed among the members thereof.
3. On the establishment of the Air Council, *the Air Board* constituted under the New Ministries and Secretaries Act, 1916, *shall cease to exist, and all the powers, duties, rights, liabilities, and property of that Board shall be transferred to the Air Council*, but nothing in this subsection shall affect:
  1. any orders issued by the Air Board, ,
  2. any instructions issued by the Air Board, or
  3. other instruments issued by the Air Board, and*all such instruments shall have effect as if issued by the Air Council.*
4. His Majesty may, by-Order-in-Council, transfer from:
  1. the Admiralty, or
  2. from the Army Council, or
  3. from the Secretary of State for the War Department,*to the Air Council or to the President of the Air Council such property, rights, and liabilities of*:
  1. the Admiralty, or
  2. the Army Council, or
  3. the Secretary of State*as may be agreed between the Air Council and the Admiralty or the Army Council, as the case may be.*

8. —

1. *The Air Council may appoint such secretaries, officers, and servants* as the Council may, with the sanction of the Treasury, determine.
2. There shall be paid, out of moneys provided by Parliament, to the members of the Air Council, *and to the secretaries, officers, and servants of the Council*, such salaries or remuneration as the Treasury may determine.

9.

1. *The Air Council may sue and be sued*, and may for all purposes be described by that name.

Section 10, Subsections 2 to 5 deal with official seal and matters of evidence in legal proceedings.

November 1918 : Canada , John A.Wilson produces a paper titled "Notes on the Future Development of the Air Service in Canada Along Lines Other Than Those of Defence". Born in Scotland in 1879, trained as an engineer, and initially employed in India, Wilson moved to Canada in 1905 and worked for the Canada Cement Company. Five years later he became director of stores and contracts for the Department of Naval Service. He was later appointed deputy minister of the department. Wilson had virtually no contact with aviation until the formation of the RCNAS. His engineering background and administrative talents were employed in

---

<sup>114</sup> source ref : UK Aviation pocketbook 1918

## Notes on "Civil Aviation"

the construction of seaplane bases at Sydney and Dartmouth in Nova Scotia, manned during the war by United States Navy personnel pending arrival of trained RCNAS staff.

November 1918 : Canada , Major Clare C. MacLaurin produces a report titled "Memorandum Regarding the Formation of a National Canadian Air Service"

MacLaurin and Wilson urge the government to embark on a national air policy, involving both regulatory functions and active flying operations. stressing that Canada's postwar flying would have to be focused on civil aviation. Other than as a pool of talent and a conduit to British aviation, the shiny CAF in England would be irrelevant. At home, a domestic air organization would have to be built from scratch. Once that was established, an air force could follow, linked to commercial flying much as the Royal Navy was associated with the Merchant Marine. Wilson was assigned the task of writing the Air Board Act; he completed the first draft in two days. This legislation was introduced into the House of Commons on April 29, 1919, and received royal assent on June 6, 1919.

The Canadian Air Board was granted wide regulatory powers over aircraft, pilots, mechanics and air bases. (but NOT Air Engineers) It was also empowered to conduct flying operations using government-owned aircraft, and to form a nascent CAF. The first chairman of the Canadian Air Board, Colonel O.M. Biggar, brought to his duties much knowledge of overseas air policies gained as a Canadian delegate the Paris Peace Conference. Colonel O.M. Biggar had even commuted by air between Paris and London. Wilson was appointed as a member of the Air Board - ref : Brace for Impact: Air Crashes and Aviation Safety By Peter Pigott "

November 1918 : SECONDED OFFICERS. The number of Canadian officers attached or seconded to the Imperial Troops or other Forces outside the Overseas Military Forces of Canada was 1,281, at the date of the Armistice. Of these 824 were seconded or attached to the Royal Air Force, of which number, 511 were Flying Officers, 57 were Administrative, Technical or Instructional Officers and 256 were under instruction in aviation. Every facility has been granted to Canadian officers desiring to serve with the Royal Air Force as Flying Officers, but service on ground duties has not been encouraged except in the case of officers specially qualified, or in the case of Flying Officers unfit for further service in the air. <sup>115</sup> - In view of the cessation of hostilities, the War Office has been requested to return all Canadian officers seconded or attached to the Imperial Forces, other than those serving with the Royal Air Force, as soon as their services can be spared,

### OVERSEAS MILITARY FORCES OF CANADA - 1918

1. Minister : THE HONOURABLE SIR EDWARD KEMP, K.C.M.G., M.P.
2. Deputy Minister : COLONEL G. F. HARRINGTON.
3. Assistant Deputy Minister : LIEUT.-COLONEL T. GIBSON, D.S.O.

<sup>115</sup> REPORT of the MINISTRY Overseas Military Forces of Canada, PRINTED BY AUTHORITY OF THE MINISTRY, OVERSEAS MILITARY FORCES OF CANADA.London, UK, 1918

## Notes on "Civil Aviation"

4. Chief of the General Staff : LIEUT.-GENERAL SIR R. E. W. TURNER, V.C., K.C.B., K.C.M.G., D.S.O.
5. Adjutant-General : MAJOR-GENERAL P. E. THACKER, C.B., C.M.G.
6. Quartermaster-General : BRIGADIER-GENERAL D. M. HOGARTH, C.M.G., D.S.O.
7. Accountant-General : COLONEL W. R. WARD, C.B.E.
8. Director-General of Medical Services : MAJOR-GENERAL G. L. FOSTER, C.B.
9. Paymaster-General : BRIGADIER-GENERAL J. G. ROSS, C.M.G.

NOTE <sup>116</sup> : -

1. The **duties of the General Staff** in England under General Turner included control of the training of :
  - a) **Infantry**,
  - b) Artillery,
  - c) Machine-gunners,
  - d) **Engineers** and
  - e) the Medical Corps.
2. The **Adjutant-General's Branch** under Maj.-Gen. Thacker had charge of :
  - a) organization,
  - b) establishments,
  - c) mobilization and demobilization,
  - d) re-inforcements, casualties and invaliding,
  - e) Discipline,
  - f) personnel services and conditions and records,
  - g) care of soldiers ' graves.
3. The Quartermaster's Branch under Brig.-Gen. Hogarth controlled :
  - a) the Army Service Corps,
  - b) the Ordnance,
  - c) the Inspection Department,
  - d) ocean and rail transport,
  - e) Postal Corps,
  - f) Veterinary Corps, and
  - g) Salvage Corps,
  - h) **Engineer Services**,
  - i) War Trophies,
  - j) postage, typing and stationery services.

The number of Canadians <sup>117</sup> who have been in the Royal Flying Corps, the Royal Naval Air Service, and later the Royal Air Force, entered through three main channels :-

1. **Officers who were seconded** to the Air Forces from the Overseas Military Forces of Canada. These officers still remained Canadian officers, although so seconded, and were liable to recall, if necessary, as such they were issued with pay from Canadian funds. Officers seconded or attached to the R.F.C., R.N.A.S., and R.A.F. up to December 31, 1918 were 1,239
2. large numbers of **Non-commissioned officers and men of other ranks** who were discharged from the Overseas Military Forces of Canada for the purpose of entering the Imperial flying services, receiving commissioned rank in that service as soon as they qualified and who were paid by the Imperial Authorities.. The "Other ranks" of the Overseas Military Forces of Canada transferred to the above **from June 1, 1916 to December, 31, 1918** numbered 2,721. *The exact figures of the "other ranks" who transferred to the Air Force prior to June 1, 1916 and subsequently received commissions are not known.*
3. A very large number of **cadets** were **enlisted by the Imperial Authorities in Canada**. At no period were the cadets under the direction of the Canadian Overseas administration, but were in the same position **as if they had enlisted (with H.M Forces) in England** and they were paid by the Imperial Authorities. Cadets enlisted in Canada by the Imperial Authorities and despatched to the above Services numbered 4,280. **At the date of the Armistice there was a large number of cadets in course of training in Canada who, as a consequence of the Armistice, did not go Overseas.**

<sup>116</sup> THE CANADIAN ANNUAL REVIEW OF PUBLIC AFFAIRS , J. CASTELL HOPKINS, 1918

<sup>117</sup> THE CANADIAN ANNUAL REVIEW OF PUBLIC AFFAIRS , J. CASTELL HOPKINS, 1918 pg 388

## Notes on "Civil Aviation"

Also a certain number of Canadians sailed to England at their own expense and joined the Flying Services, while a certain number who came over to join British Regiments have also subsequently transferred to the Royal Air Force.

There were also a very considerable number of other ranks employed in Canada by the Royal Air Force, and although it is impossible to give exact figures, there have been in the Air Force probably well over 13,000 Canadians of all ranks.

There have also been a number of Canadians who have served in the ranks in the Air Forces in England and France, amounting to approximately 350.

The conditions on which recruiting proceeds are that :-

1. *"every candidate accepted as a Cadet* shall receive :
  1. training at Imperial expense
  2. better than Canadian soldier's pay; and
2. *if a Cadet qualifies for flying work, he receives*
  1. *a commission* as Lieutenant *with*
  2. *special allowances* added to his pay *which make his compensation nearly double that of an officer of similar rank in a Line regiment.*

The conditions of joining the Imperial Air Services were as follows:

1. Age : 18 to 30, men over 25 require "*special qualifications*";
2. **Education : High School for 3 years or a special course ;**
3. Health : absolute medical fitness according to military standards:
4. Pay :
  1. \$1.10 per day during instruction with all necessary accommodation, uniforms, etc., plus 25 cents to 50 cents per day flying-pay and,
  2. when commissioned as 2nd Lieutenant, a total of about \$5.00 per day.
5. Period of service committed to upon joining :
  1. 4 years, but
  2. not longer than the duration of the war.

The subjects for training (initially) included:

1. aerial observation,
2. instruments,
3. wireless,
4. map reading,
5. bombs and bomb dropping,
6. aerial photography,
7. aerial fighting,
8. meteorology,
9. engine construction,
10. aeroplane construction,
11. machine guns.

Canadian costs for Aeroplanes :

Training machines \$7,500 each,

Scout machines (Fighters) \$10,000 each, and

battle-planes (bombers) \$15,000 each.

During 1918 there were 10,000 "aviators" under training in Canadian Camps at :-

1. Borden,
2. Leaside,
3. Armour Heights,
4. Deseronto,
5. Beamsville, and
6. Hamilton

1918 : Maj.-Gen. Charles Hoare is in command of the R.F.C. in Canada and in the United States.

## Notes on "Civil Aviation"

February 1918 : Canadian, Brig.-Gen. A. C. Crichtley, D.S.O., was appointed Commandant of the E.A.F. Cadet School in England. Lieut.-Col. G. C. St. P. de Dombasle was Commandant of the School of Military Aeronautics at Reading ; Major F. V. Woodman of Winnipeg held the Imperial appointment of Commandant at R.A.F. Camp Everman in Texas, U.S. ; Lieut.-Col. A. Hamilton Gault, D.S.O., was Commander of one of the four Divisional Wings of the British Air forces in France ; Lieut.-Col. W. A. Bishop, v.c., was gazetted in September a General Staff Officer in the British Air Service ; Lieut.-Col. H. C. Mayes was appointed Adviser to the Air Ministry on the physical and athletic training of the R.A.F.

Squadron or Wing Commanders corresponded to Battalion and Brigade Commanders in the Infantry.

Sir Herbert Holt was President of the Montreal branch of the Aerial League of the British Empire.  
Lieut.-Col. W. Hamilton Merritt was founder and President the Aero Club of Canada.

of which, did good work in this direction, in helping recruiting, and in the contribution of aeroplanes to the Force.

the Aero Club of Canada. also aimed to promote all forms of aviation, to develop the science of aeronautics, to encourage the manufacture of aeronautic devices, to promote the holding of aviation conferences, to encourage and assist all who wished to take up Aviation in the current War.

In April the Aero Club sent a Deputation to Ottawa, urging the Government to contribute two Squadrons to *a proposed Canadian Wing of 5 Squadrons in the R.A.F.*

Meantime, Colonel Merritt had obtained a charter for the Canadian Aviation Fund and a branch of the Aerial League of the British Empire had been incorporated at Montreal. The Montreal branch of the Aerial League had the distinction of promoting an Aerial mail service between Toronto and Montreal with Capt. Bryan Peck carrying mails between the two cities, 330 miles, in six hours ; on Aug. 15th, at 9 a.m., after correspondence lasting over a year, between Colonel Merritt and the Postal authorities, Lieut. Tsumper Longman left Toronto with a mail-bag, reached Ottawa at 2.50 p.m., returning on the 17th, in a trip lasting from 6.50 a.m., to 12.26 p.m.

A "Deputation" of the branch of the Aerial League of the British Empire waited upon the Government on Dec. 10th, and offered evidence as to the {what} .

It was stated that the United States had been laid out in four great aerial highways, on two of which, aerodromes and landing places were being constructed, and it was claimed that with the existence of machines capable of carrying four tons and traveling aeroplanes capable of carrying twenty tons, the possibilities in a commercial way were great and obvious.

It was declared essential to have aerial routes and safety regulations established.

Hon. N. W. Rowell, for the Government, pointed out that the success of the Canadian Aeroplane industry, and the large amount of spruce supplied from British Columbia for the manufacture of aeroplanes on this continent and in Europe, had made it

necessary to give the subject attention.

Treaties were contemplated in order to regulate Air service between the various Allied nations, and they would be of value in regulating air navigation.

Hon. N. W. Rowell, stated The Government was "heartily in sympathy with the objects of the League".

The attitude of the Government towards Aviation, apart from Sir Sam Hughes' personal viewpoint, in earlier years during the greater part of the War period was based upon its undoubtedly great expense and the natural absence of all expert footing for its

Canadian establishment. The Imperial Government would have been glad to lend this aid but it had its own troubles in Air Force

matters up to 1918 ; there were, also, obvious difficulties in the operation of two such Forces on the Western front.

To withdraw Canadian aviators from the R.A.F. would have been a serious thing to do during most of the months of 1918.

Canadian opinion, however, grew more and more favourable as the months of the last war-year passed and it was understood that the matter would be discussed when the Ministers went to England to take part in the War Cabinet and Conference; it was, also, claimed that Generals Sir R. Turner and Sir Arthur Currie approved the principle of a Canadian Air Force though there was no public expression to that effect.

In May Sir Edward Kemp announced that, after various negotiations, the Imperial Air authorities had agreed to certain conditions; in June these were approved by Mr. Premier Borden and his colleagues then in England; meanwhile, two Canadian squadrons were under organization as a nucleus for the new Force.

## Notes on "Civil Aviation"

On July 8th, 1918, arrangements were concluded between the Canadian Overseas Minister and the Air Minister (Lord Weir) along lines which were later confirmed at Ottawa by Order-in-Council as follows:

(1) That authority be granted for the formation of a Canadian Air Force and of service units of such Force; (2) that further Service

Units be formed from time to time as approved by the Overseas Minister and the Secretary of State for the British Air Force ; (3) that the Canadian Force shall be part of the Overseas Military Forces of Canada and subject to the Militia Act of Canada and be under the same establishment as the R.A.F. ; (4) that the Overseas Minister for Canada be empowered to take such action

from time to time in this respect as he may deem necessary. According to the agreement upon which this was based the squadrons were to be organized in England, in conjunction with the R.A.F., with a type of unit equipment decided by the Air Council ; Canadian officers and other ranks could be transferred to the new Force upon recommendation and release by the Air Council the former to be at once replaced by the Canadian Overseas Forces; the Canadian Government was to assist by provision of

personnel with pay, and allowances, and supply, and reinforcements for Service Squadrons; the Imperial Air Council was to maintain responsibility for command and administration when in a theatre of war or under training in Great Britain. A Canadian

Air Force Section of the Canadian General Staff was created for purposes of organization and a selection of officers made ; the types

decided upon were a single-seated scout squadron and a day-bombing squadron.

08 August 1918 : Ottawa : Hon. A. K. Maclean, Acting Minister of Naval Service, states "the Naval branch of the new Air Service would be under direction of his Department" and called for the enlistment of Cadets with an immediate and large response.

05 September 1918 : Minister of Naval Service Hon. C. C. Ballantyne states "Early in 1918, the Government considered that the formation of an Air Service for coastal defence was of vital and immediate importance to Canada, and, as it was felt that this service should be of a Naval character and should work in conjunction with the R.C.N., the matter was brought strongly before the notice of the British Admiralty. They were in complete agreement, and sent out an Airship officer, Flt.-Com. Barron, in March, 1918, to inquire into the general possibilities." Preliminary organization had been effected with the Director of Canadian Naval

Services, **Admiral Sir Charles Edmund Kingsmill** (helped establish and was the first Director of the Royal Canadian Navy)

08 October 1918 : R.C.A.S. said to have been completely organized with bases chosen and 40 Cadets under training.

08 November 1918 : The R.C.A.S. rates of pay were gazetted as follows :

Flight-Lieutenant from \$4.75 to \$5.50 per day ;

Flight-Commander \$7.00 to \$7.50 ;

Squadron Commander \$8.00

Wing Commander \$10.00;

Technical officers from \$4.00 to \$7.50.

probationary mechanics from \$1.10 to \$1.35

air-craftsmen from \$1.10 up to \$3.75

air-mechanics from \$1.10 up to \$3.75.

In England it was understood that Colonel Bishop acted for some time as organizer and Director of the proposed Canadian Force *and then Colonel Collishaw*,

The following equipment was presented or offered to the Canadian Government in order to facilitate its action and help organization : Donor Aeroplanes

The Imperial Air Fleet Committee 3

The Overseas Club and Patriotic League 16

The Air Ministry (German Machines) 40

The Imperial Munitions Board 50

British Government (Bombing Machines) 50

British Government (Biplanes and Scout Fighters) 42

## Notes on "Civil Aviation"

The Armistice unsettled the Government's policy in this connection and at the close of the year nothing was definitely known as to the future.

The R.A.F. in Canada was being demobilized and the press stated, unofficially, that the Naval Air Service would be discontinued; 10 December 1918 : Hon. Mr. Rowell told a Deputation that "the Government appreciated the importance of Commercial aviation" ; a conference took place at Ottawa

12 December 1918 : Ottawa : Aviation conference, establishes a National Aeronautical Advisory Committee to deal with the situation the uses of aircraft, the utilization of existing personnel and the creation of aerial routes, etc.

28 December 1918 : it is announced (where?) that two great aerial highway routes across the Dominion :-  
St. John's, Nfld., to Victoria, B.C., with shorter ones as follows:

1. Hudson Bay Airway (Winnipeg to Port Nelson, Manitoba)
2. Peace River Airway (Edmonton. Alberta to Dawson City, Yukon Territory ;
3. Dawson Airway (Victoria to Vancouver to Prince Rupert and thence to Dawson, Yukon Territory .
4. Others were under arrangement

Under the War Committee of the Canadian Cabinet Messrs. Rowell, Ballantyne, Doherty, Carvell, Sifton, General Mewburn, Sir G. Foster, Sir E. Kemp, with Sir Robert Borden as Chairman, and Mr. Rowell as Vice-Chairman a considerable work in the co-ordination and development of war activities was carried on during the year. This Committee initiated proposals, planned the details and presented them in a state of workable efficiency to the full Cabinet for consideration; it was the opposite of the British scheme under which the War Cabinet was the real cabinet with full power and responsibility.

17 December 1918 : speech by Hon. N. W. Rowell at Bowmanville, Ontario - he reviewed the war-work and policy of the Union Government at great length and a summary of his statement will be of interest :-

1. Patronage in Government appointments was abolished and the whole "outside Civil Service" <sup>118</sup> is placed under the "Civil Service Commission" <sup>119</sup>.
2. Canadian Federal Government "pledged itself that wealth would be conscripted by taxation of war profits and increased taxation of income. This pledge also has been carried out.
3. The Business War Profits Tax has been continued and broadened so as to include large numbers of industries which were hitherto exempt from its operation.
4. The Income tax has been greatly increased and the taxation of luxuries, jewelry, automobiles, etc. made a special matter.

We have completed the purchase of the Canadian Northern Railway and consolidated all the Government-owned railways under a Board of Directors of business men who will operate the roads in the national interest.

We have placed the operation of the new Government steamships under this Board, so that Canada will own and operate one of the greatest transportation systems in the world. We have declared in favour of the Government ownership and development of the great water powers in the St. Lawrence River, which will mean so much to the industrial life of Canada.

An Act Respecting the Civil Service of Canada (1918). The 1918 Act extended the Civil Service Commission jurisdiction to the Outside Service (across Canada). It gave the Commission the responsibility to organize and classify the entire service. Its staff increased to a high point of 272 in the early 1920s

distinction between the political and non-political officers of government.

Civil Service, the term used to denote the non-political officials of government, whether in the Dominion or the provinces. The officers of government were all appointed by the Crown, or by its provincial representative, and held office "during the pleasure of the Crown".

Though Canada is now a Dominion and one of the group of nations which make up the British Empire, yet we must remember that our Dominion began as a colony, 1stly of France and 2ndly of England.

The Governor-General.—In Great Britain, as we have seen. Parliament is made up of the King, the House of Lords, and the House of Commons. In Canada it is made up of the King, the Senate, and the House of Commons.

---

<sup>118</sup> Civil Service in Canada, R. M. Dawson, The civil service of Canada, London, 1929

## Notes on "Civil Aviation"

For many reasons it is impossible for the King to take a personal part in the government of Canada, so he is represented by the Governor-General. We should not forget, however, that the King is just as much King of Canada as he is of Great Britain. The title of our present sovereign is "George V, by the Grace of God, of the United Kingdom of Great Britain and Ireland and of the British Dominions beyond the Seas, King, Defender of the Faith, Emperor of India." The Governor-General represents the King and not the British government. "He is the visible link between the United Kingdom and Canada, and his office emphasizes the unity of the Crown within the Empire."

The Governor-General is appointed by the King on the advice of the British government, but, before the appointment is made, the advice of the Canadian government is sought and its approval obtained. He is usually a British statesman or soldier of distinction. He is the constitutional head of the Canadian state, and, as such, must in all Canadian affairs act upon the advice of his Cabinet, that is, his responsible ministers. He takes no part in political struggles and favors neither the government nor the opposition. Like the King, he does not attend meetings of the Cabinet, but all legislation passed in Parliament, as well as all official acts performed by the Cabinet, must receive his assent. He has the power to dismiss his Cabinet, but in such an event he must find other ministers who will be prepared to support his actions before the House of Commons and the people of Canada.

A cabinet minister is placed in charge of each department of the public service and is responsible for the efficient administration of that department. He must attend to the preparation of legislation that concerns his department, must present its financial claims to the House of Commons, and must be prepared to defend his administration before Parliament. If the minister in charge is a member of the Senate, the duty of presenting his estimates is delegated to another minister who has a seat in the House of Commons.

The Minister of Railways and Canals has charge of everything affecting the interests of the railways and canals of the country. His duties are not so important as they formerly were, because all the railways belonging to the government have recently been placed in charge of a president and a board of directors.

The Minister of Marine and Fisheries superintends all matters relating to navigation and the fisheries, such as harbors, lighthouses, safety of navigation, inspection of shipping, fishing regulations, etc.

The Minister of Public Works deals with the erection and management of all public works required for the conduct of business, with the exception of railways and canals.

The Minister of National Defence has charge of the defence of Canada, including the land, naval, and air forces. He supervises military camps and forts, the Royal Military College at Kingston, and the naval barracks at Halifax and Esquimaux.

The Civil Service.—In each of the departments of public service that we have just mentioned, hundreds and sometimes thousands of clerks and other persons are employed. These are called civil servants to distinguish them from the soldiers and sailors, who are military or naval servants of the government.

*Those who live and work in Ottawa, the capital of the Dominion, are called the inside civil service, while those, like customs and excise officers and postal employees, who are scattered throughout the country, are known as the outside civil service.*

## Notes on "Civil Aviation"

*In earlier days men and women were usually given positions in the civil service as a reward for having done something to help their own political party. This system, known as the patronage system, was very bad, because, through it, positions were often given to people who were not able to do the work.*

Further, when one party was defeated and the other came into power, many of those appointed by the old party lost their positions, not on account of inefficiency, but to provide places for supporters of the new government.

*This old system has been largely done away with, and men and women are now, for the most part, given positions and promoted only when they show that they are able to do their work efficiently.*

*The civil service, both inside and outside, is now under the control of the Civil Service Commission, a body independent of politics. Ability and fitness are demanded in every applicant for a position in the civil service. This is a great reform, for the country depends very largely upon the civil service for good government.*

The Civil Service Act, 1882, instituted a Board of Civil Service Examiners, who examined all candidates for admission to the civil service; and these examinations prevented at least the appointment of illiterates, if they did little more

the "inside service" <sup>120</sup>- the departmental officials

the "outside service" <sup>121</sup> - the departmental officials - The Outside Service.—The outside service of the department is carried on by a staff of Inspectors. - These officials are the representatives of the Department in the fields to which they are assigned.

The Privy Council.—The constitution of Canada does not recognize any such body as the Cabinet, but it does recognize and in fact provides for a body known as the Privy Council. Cabinet ministers, as soon as they assume office, are sworn in as members of the Privy Council, and they remain members of that body as long as they live.

The Privy Council, therefore, includes all those men still living who have at any time held cabinet positions. It may also contain men who have never held office under the Crown, but who are sworn in as members of the Privy Council as a recognition of distinguished services rendered to the Dominion.

A recent writer on the Canadian constitution says: "The Privy Council never meets as a body, since it contains the members of former administrations, but the Cabinet is considered to consist of such of the privy councillors (who are members of Parliament) as best and most efficiently represent the views of the dominant political party. It is that part of the Privy Council called the Cabinet which advises the Governor-General."

A command issued by the Privy Council and signed by the Governor-General is called an order-in-council and has all the force of law. Much of the work of government is carried on by means of such orders, which are based upon powers given to the Privy Council by Parliament.

A part of our constitution, the British North America Act, is a law of the Imperial Parliament and can be changed only by Act of that Parliament. Then again, the Governor-General may reserve bills which have passed the Canadian Parliament for the consideration of the British government, if he thinks that they are harmful to the Empire at large or contrary to a British treaty with a foreign country.

Unless the British government approves such bills within two years, they lapse and cannot become law. For the same reasons, the Imperial government may disallow, or set aside, any Act of the Canadian Parliament within two years after it has been passed.

Again, the Judicial Committee of the Privy Council, a court sitting in England, is the final court of appeal in civil cases for Canada, as it is for most of the Empire. This means that in cases where Canadians are not satisfied with the decisions of the Canadian courts, they may appeal to the Judicial Committee of the Privy Council. This court may or may not change the decision already given, but its decision is always final. Moreover, foreign affairs are under the control of Great Britain, and thus it is possible for Canada to be bound by treaties and even to be plunged into war without being consulted.

<sup>121</sup> STUDIES IN CITIZENSHIP - JAMES McCAIG, M.A., LL.B., THE EDUCATIONAL BOOK CO., LIMITED 1925.

## Notes on "Civil Aviation"

The Lieutenant-Governor.—The representative of the King in a province of Canada is known as the Lieutenant-Governor. He is appointed by the Dominion government and holds office for five years.

The union of the R.F.C. and the R.N.A.S. by the King's command on May. 7th, as the Royal Air Force, aided in the effectiveness of the Service and facilitated recruiting and training.

in the Commons on May 16th 1918 certain information was given:

1. The percentage of accidents to the number of Canadian Cadets named to Mar. 31, 1918 was 3 .69 fatal, 2.50 serious and 3.36 slight,
2. In cases of permanent injury the Imperial Government granted pensions,
3. So far, *about 580 men had come out from England as experts* to aid in the training *including 47 Canadians with experience.*

The Ottawa Journal (June 6th) responded with these facts: "what *the Imperial Government* has so far done is to *offer commissions* to 7,000 young Canadians as "*officers in the British Forces*" (with special extra pay) *who otherwise would have been drafted as privates into the Canadian Army.*

The Toronto Globe and the Star and some other critical organs demanded Canadian control of these Aviation interests in Canada : they did not demand, however, that Canada should pay the expenses of training the men and supplying the machines and building the aerodromes! Nor was anything said about the difficulty of aeroplane timber in British Columbia where labour was short and the Imperial Munitions Board, which had this part of the work in hand, could only get 3,200 men in June, 1918, to supply an almost unlimited British and French demand for Coast timber.

Later on, however, these and other journals did urge the organization of a Canadian Flying Corps. Meanwhile, General Hoare was quietly and steadily at work and on Dec. 7th was able, in thanking P. D. Ross, Chairman of *the Ottawa Aviation Recruiting Committee*, for his services, to state that *2,538 trained pilots had been sent from Canada to the Front, while 552 were in Canada with training completed.*

When demobilization was in progress at the close of 1918 it was found that there were:

- 3,923 Canadian air officers demobilized and
- 1,697 Canadian air officers still on the strength with
- 4,392 Cadets demobilized and
- 373 Cadets on the strength.

The Royal Air Force was entirely under the direction of the Imperial Authorities, yet, in view of the large percentage of Canadians included in its personnel, it was felt by the Minister - Overseas Military Forces of Canada that it was proper that some action should be taken to recognise their Canadian identity, and to ensure that a record of Canadians in the Royal Air Force and of their exploits should be kept.

Accordingly negotiations were entered into (the -subject of discussion between the Minister - Overseas Military Forces of Canada and the Secretary of State for the Royal Air Force in the early part of 1918) with the Secretary of State for the Air as a result of which the following arrangement was come to:—

1. The Royal Air Force agreed to furnish the Minister - Overseas Military Forces of Canada with a Nominal Roll of Canadians in the Royal Air Force, and to advise him from time to time of all accretions to and deductions from it.
2. *All Canadians in the Royal Air Force were to be permitted to wear a Canadian badge either on their shoulder straps or on their sleeve.*
3. It was agreed to give Canadians *representation on the Royal Air Force Headquarters and Staff.*
4. A monthly statement of the exploits of Canadian Airmen was to be furnished to the Minister, with a view to its dissemination to the Canadian public.
5. It was agreed in principle that *Canada should have a Flying Corps of her own*, which, while distinct in its organisation and administration, would form part of the Royal Air Force *for the purpose of operations in the Field.*

This was immediately followed up by further negotiations, and a memorandum setting out tentative arrangements for the organisation of a Canadian Air Force was drawn up between the Minister - Overseas Military Forces of Canada and the Secretary of State for the Royal Air Force, and definitely settled July 8, 1918.

## Notes on "Civil Aviation"

This memorandum was later embodied as part of a British Parliament "Order in Council" which, subsequently, confirmed the agreement.

The provisions of the Order in Council were substantially as follows:—

(a) That *(Imperial Parliament) authority be granted for the formation of a Canadian Air Force and of Service Units of such Air Force in accordance with the terms of the memorandum* (marked "A,") which had been approved by the (Imperial) Secretary of State of the Royal Air Force.

(b) *That further Service Units of said Canadian Air Force be formed from time to time, as and when the same might be approved by the Minister of Overseas Military Forces of Canada and the Secretary of State for the Royal Air Force.*

(c) That *the Canadian Air Force form a part of the Overseas Military Forces of Canada and be subject to the provisions of the Militia Act of Canada.*

(d) *That the Canadian Air Force be under the same establishment as may from time to time obtain in the Royal Air Force.*

(e) That *the Minister of Overseas Military Forces of Canada be empowered from time to time to take any and all action that he might deem necessary for the formation, extension, organisation, and administration of the Canadian Air Force.*

<p style="text-align: center;"><b>PROVISIONS OF THE MEMORANDUM SETTING OUT TENTATIVE ARRANGEMENTS FOR THE ORGANISATION OF A CANADIAN AIR FORCE 1918</b></p>
---

The memorandum referred to provided inter alia (among other things) :—

1. That the formation of two (2) Canadian Air Squadrons should be proceeded with forthwith.
2. That these Squadrons should be organised in England by the Overseas Military Forces of Canada in conjunction with the Royal Air Force.
3. That the type of Unit and equipment should be decided by the (Imperial) Air Council.
4. That the personnel of the Squadrons should be drawn as follows:—

(a) Officers :

1. *From officers of the Overseas Military Forces of Canada who are seconded to the Royal Air Force and who were recommended by the Air Council ; and*
2. *from officers of the Royal Air Force who were Canadian citizens and who are available and recommended for release (from the RAF) by the Air Council. Such released officers to be replaced at once by the Overseas Military Forces of Canada.*

(b) Other Ranks :

1. *By the transfer of other ranks of the Royal Air Force who were Canadian citizens and who can be released by the Air Council ; and*
2. *by enlistment of men with suitable qualifications, or*
3. *by transfer from other Canadian Services of men with suitable qualifications.*

5. That *the Canadian Government should assume responsibility for assisting in the formation of the Squadrons by:-*

1. *the provision of necessary personnel, and for*
2. *the provision of pay and allowances of such personnel, as well as for*
3. *the supply and reinforcements for Service Squadrons.*

6. That *the Imperial Air Council should :-*

1. *assume the responsibility for the command and administration of the Canadian personnel when in a theatre of war or under training in Great Britain, and*
2. *assume the responsibility for the provision, maintenance, and*
3. *assume the responsibility for replacing in all cases of machines, tools, technical equipment and supplies necessary to maintain the said Forces ;*
4. *be responsible for the necessary training facilities.*

<p style="text-align: center;"><b>ORGANISATION OF THE CANADIAN "AIR FORCE" 1918</b></p>
---

## Notes on "Civil Aviation"

In accordance with the memorandum setting out tentative arrangements for the organisation of a Canadian Air Force, a Canadian "Air Force Section" of the Canadian General Staff ( under Gen. Turner) was created for the purpose of carrying out the organisation of the Squadrons.

Steps were taken to procure the necessary personnel in accordance with the provisions of the memorandum, and a *selection of officers was made, representative of the best traditions of Canadian aerial fighting.*

*The other ranks were selected from Units of the Overseas Military Forces of Canada, special attention in the selection being paid to their civil occupation, so that the men most suited to mechanical work might be' obtained.*

The types of Squadrons decided upon were a single-seater Scout Squadron and a day Bombing Squadron.

These Squadrons were organised in England, and when organised went into quarters at Upper Heyford, near Oxford.

It was intended that these Squadrons should be trained and sent to France to take their place in the field as fighting Units.

To effect this the following **establishment** was authorised:

i. A Director of Air Service (who? ) , who will be the Officer Commanding the Canadian Air Force and will advise the General Staff on matters relating to it. He will have to assist him in his duties:

- A. a Staff Captain, and
- B. a Staff Lieutenant along with
- C. four other ranks.

ii. A Wing Headquarters consisting of:-

- A. a Lieutenant Colonel in command of the two Squadrons ( Lt.-Col. William Avery "Willy" Bishop, RFC / RAF ?) and :-
- B. a Captain for administration,
- C. a Captain for technical duties, and
- D. a Lieutenant for armament along with
- E. 5 other ranks.

who will have to assist the Commander in his duties

iii. No. 1 Squadron (a "Scout" Squadron) consisting of:-

- A. 18 aeroplanes
- B. commanded by a Major (Maj. Raymond Collishaw, RNAS/RAF ?)
- C. three Captains,
- D. (3 ?) Flight Commanders, and
- E. 18 "Flying Officers" of the rank of Lieutenant.
- F. one Administrative Lieutenant and
- G. one Technical Lieutenant
- H. The "other ranks" for this Squadron total 159.

iv. No. 2 Squadron (a "Day Bombing" Squadron) consisting of:

- A. 18 aeroplanes with
- B. one Major Commanding,
- C. three Captains,
- D. Flight Commanders,
- E. 18 Flying Officers
- F. one Administrative Lieutenant and
- G. one Technical Lieutenant
- H. one additional officer
- I. 160 other ranks.

v. A "Technical and Supply Branch" consisting of:

- 1. A Headquarters,
- 2. Technical Branch and
- 3. a Supply Depot.

The work of this Branch is described in part in the Section which follows, the "Bureau of Aeronautical Information" established in the summer of 1918 having been absorbed into this Branch. *the Canadian Bureau of Aeronautical Information was absorbed in the Technical and Supply Branch of the Canadian Air Force upon its creation.*

## Notes on "Civil Aviation"

It was seen that there was *a large amount of valuable information* on this subject, which *could be collected during the progress of the war, but which would not be so easily obtained once peace had been signed and the aerial forces of the allies completely demobilised.* In the summer of 1918 a small section of the *Overseas Military Forces of Canada* (under control of the Militia) was formed known as *the Canadian Bureau of Aeronautical Information* tasked with collecting all available technical information regarding the development of aeronautics during the war, both from Allied sources, and where possible from enemy sources.

The work of the *Bureau of Aeronautical Information* <sup>122</sup> consisting of the collection and filing for future reference :-

- a) drawings,
- b) plans,
- c) specifications, and
- d) all other technical information and data regarding:
  - i. aeroplanes,
  - ii. engines,
  - iii. accessories, and
  - iv. aircraft equipment in general.

This information should be invaluable to Canada after the war, *not merely from a military point of view, but for the purpose of the aeronautical development generally, which will, without doubt, become a matter of great importance in the future.*

To achieve the objects of *the Bureau*, it *entered into arrangements with the Air Ministry whereby its representatives are allowed free access to the Technical Departments concerned, in order to make known its requirements, and to obtain any documents, publications, drawings, etc., which may be considered of value.*

In addition, a few officers of the Bureau of Aeronautical Information have been sent on missions to France and Italy, to gather as complete information as possible regarding aeronautics in these countries.

*Plans are on foot for the purpose of coming to an arrangement, with the Air Ministry, under which future aeronautical students from Canada may receive their final training as aeronautical engineers at the leading aeronautical establishments in the United Kingdom.*

### Training

*Training proceeded along the lines necessary to prepare them for that purpose (as fighting Units), but as a result of the signing of the Armistice they were not required* in France and *their training was then specially directed to fit them for post-war flying, and to giving them instruction in other branches of aeronautics (Aeronautical Engineering) likely to prove beneficial to Canada in the future. Special attention was paid to wireless training, photographic training, aerial geographical training and cross-country flying.* In addition, *steps were taken to complete the organisation of the Canadian Air Force so that, though small, it might provide a fully developed organisation on which might be based any future organisation in Canada.*

### Present Equipment.

The following equipment has been secured *without charge* for the Canadian Air Force in the manner indicated.

Aeroplanes.—

- A. 3 Presented by the Imperial Air Fleet Committee
  - B. 16 Purchased and Presented by the Overseas Club and the Patriotic League
  - C. 40 German aeroplanes in serviceable condition allotted by the Air Ministry
  - D. 50 Curtis machines presented to the Canadian Government by the Imperial Munitions Board.
- giving altogether a total of 109 machines available for *the Canadian Air Force when it returns to Canada.*

### Canadian Air Force.

In 1918 the question of forming a Canadian Air Force, distinct from the Royal Air Force, occupied the attention and received the careful consideration of the Minister.

---

<sup>122</sup> THE CANADIAN ANNUAL REVIEW OF PUBLIC AFFAIRS, J. CASTELL HOPKINS, 1918 pg 349

Previous to this year, for various reasons, *it had not been considered in the best interests of Canada or the Empire as a whole to enter on a separate programme in this connection.*

As the war proceeded, and as it became apparent that a Flying Corps would be an essential and important part of any Canadian post-bellum military organisation, as well as likely to have a considerable influence on the development of commercial aeronautics in Canada after the war, *it was resolved to take such steps as were necessary to provide Canada with, at least, a nucleus of such an organisation.*

It was fully realised that *any such Force must of necessity be confined within small dimensions*, because any attempt to withdraw Canadian personnel from the Royal Air Force in large numbers would have had a most prejudicial effect on the efficiency of that Force.

Further, *the expenditure involved in the maintenance of a large Air Force would have been very great.*

30 December 1918 : Aerial achievements by the United States during the war to date:

The "giant seaplane" carried 51 passengers in a test.

One of the greatest scientific achievements from the technical standpoint was the production of non-inflammable helium gas for balloons in large quantities. The pre-war scarcity of helium could be appreciated from the statement that until 1916 not more than 100 cubic feet could be obtained, and the usual selling price was about \$1,700 Per cubic foot.

At the cessation of hostilities the U.S Navy were able to have, compressed on the deck of a vessel ready for use, 147,000 cubic feet of pure helium, and the helium production plants under construction in the U.S. would give at least 50,000 cubic feet daily, at an estimated cost of 10 cents (3d.) per cubic foot.

"the record of the production and development of the Liberty engine conclusively proved the wisdom of the decision to concentrate efforts on this one engine"

More than 19,000 Liberty engines have been produced in the United States. The Liberty engine was an achievement which, for saving, constructive imagination, and farsightedness, would ever be a cause of pride to the American people.

**1919 : MILITARY, NAVAL AND AIR CLAUSES - PARIS PEACE CONFERENCE**

AIR CLAUSES -

Article 198.

1. The armed forces of Germany **must not include** any military [Army] or naval air forces.
2. Germany may, during a period not extending beyond October 1, 1919, maintain a maximum number of one hundred seaplanes or flying boats, which shall be exclusively employed in searching for submarine mines, shall be furnished with the necessary equipment for this purpose, and shall in no case carry arms, munitions or bombs of any nature whatever.
3. In addition to the engines installed in the seaplanes or flying boats above mentioned, one spare engine may be provided for each engine of each of these craft.
4. No dirigible shall be kept.

Article 199.

1. Within two months from the coming into force of the present Treaty, the personnel of the air forces on the rolls of the German land and sea forces shall be demobilised.
2. Up to 01 October 1919, however, Germany may keep and maintain a total number of one thousand men, including officers, for the whole of the cadres and personnel, flying and non-flying, of all formations and establishments.

Article 200.

Until the complete evacuation of German territory by the Allied and Associated troops, the aircraft of the Allied and Associated Powers shall enjoy in Germany freedom of passage through the air, freedom of transit and of landing.

Article 201.

During the six months following the coming into force of the present Treaty, the manufacture and importation of aircraft, parts of aircraft, engines for aircraft, and parts of engines for aircraft, shall be forbidden in all German territory.

Article 202.

1. On the coming into force of the present Treaty, all military and naval aeronautical material, *except the machines mentioned in the second and third paragraphs of Article 198*, must be delivered to the Governments of the Principal Allied and Associated Powers.
2. Delivery must be effected at such places as the said Governments may select, and must be completed within three months.
3. In particular, this material will include all items under the following headings which are or have been in use or were designed for warlike purposes :
  - 1) Complete aeroplanes and seaplanes
    - a) those being manufactured,
    - b) as well as those being repaired or assembled.
  - 2) Dirigibles:
    - a) able to take the air,
    - b) as well as those being manufactured, repaired or assembled.
  - 3) Plants for the manufacture of hydrogen.
  - 4) Dirigible sheds and shelters of every kind for aircraft.
    - a) Pending their delivery, *dirigibles will*, at the expense of Germany, *be maintained inflated with hydrogen* ;
    - b) the plants for the manufacture of hydrogen, as well as the sheds for dirigibles, may, at the discretion of the said Powers, be left to Germany until the time when the dirigibles are handed over.
  - 5) Engines for aircraft
  - 6) Nacelles and fuselages

## Notes on "Civil Aviation"

- 7) Armament (guns, machine guns, light machine guns, bomb-dropping apparatus, torpedo-dropping apparatus, synchronisation apparatus, aiming apparatus)
  - 8) Munitions (cartridges, shells, bombs loaded or unloaded)
  - 9) stocks of explosives or material for their manufacture)
  - 10) Instruments for use on aircraft
  - 11) Wireless apparatus and photographic or cinematograph apparatus for use on aircraft
  - 12) Component parts of any of the items under the preceding heads
- 4) The material referred to above shall not be removed without special permission from the said Governments.

### PART XI - AERIAL NAVIGATION

#### Article 313.

The aircraft of the Allied and Associated Powers shall have full liberty of passage and landing over and in the territory and territorial waters of Germany, and shall enjoy the same privileges as German aircraft, particularly in case of distress by land or sea.

#### Article 314.

The aircraft of the Allied and Associated Powers shall, while in transit to any foreign country whatever, enjoy the right of flying over the territory and territorial waters of Germany without landing, subject always to any regulations which may be made by Germany, and which shall be applicable equally to the aircraft of Germany and to those of the Allied and Associated countries.

#### Article 315.

All aerodromes in Germany open to national public traffic shall be open for the aircraft of the Allied and Associated Powers, and in any such aerodrome such aircraft shall be treated on a footing of equality with German aircraft as regards charges of every description, including charges for landing and accommodation.

#### Article 316.

Subject to the present provisions, the rights of passage, transit and landing, provided for in Articles 313, 314 and 315, are subject to the observance of such regulations as Germany may consider it necessary to enact, but such regulations shall be applied without distinction to German aircraft and to those of the Allied and Associated countries.

#### Article 317.

Certificates of nationality, airworthiness, or competency, and licences, issued or recognised as valid by any of the Allied or Associated Powers, shall be recognised in Germany as valid and as equivalent to the certificates and licences issued by Germany.

#### Article 318.

As regards internal commercial air traffic, the aircraft of the Allied and Associated Powers shall enjoy in Germany most favoured nation treatment.

#### Article 319.

Germany undertakes to enforce the necessary measures to ensure that all German aircraft flying over her territory shall comply with the Rules as to lights and signals, Rules of the Air and Rules for Air Traffic on and in the neighbourhood of aerodromes, which have been laid down in the Convention relative to Aerial Navigation concluded between the Allied and Associated Powers.

#### Article 320.

**The obligations imposed by the preceding provisions shall remain in force until January 1, 1923,** unless before that date Germany shall have been admitted into the League of Nations or shall have been authorised, by consent of the Allied and Associated Powers, to adhere to the Convention relative to Aerial Navigation concluded between those Powers.

1918 : 1918, the 2,600-mile trip from England to Egypt was accomplished. At this stage, also, the Royal Air Force which was a combination of the R.F.C. and R.N.A.S., on April 1st, under one management divided its operations into three groups as follows:  
(1) Reconnaissance machines used for contact patrol work over the lines, the direction of artillery fire, photography, and general strategical work;

(2) heavy bombers capable of travelling long distances without escort, and carrying heavy loads of bombs in addition to defensive armaments;

(3) fast fighting scouts possessing exceptional climbing powers, heavily armed, and capable of manoeuvring at a very high rate of speed.

There were, also, huge battle-planes equipped with cannon and

one, especially, prepared and almost ready to bombard Berlin (to be Piloted by a Canadian) when the Armistice came.

there were seaplanes, flying-boats and hydro-aeroplanes while Wireless was installed and the co-operation of units in Squadrons rendered effective. src ref Canadian Annual report 1918 pg 149-150

Before the close of the War the chief British aeroplanes were working as follows :

Time Speed at required Continuous. Machine. 10,000 ft. to climb flight capacity.  
10,000 ft.

P. E. 2. B 76 40 minutes. 3 1/2 hours.

Vickers' Fighter 76 40 minutes 3 1/2 hours.

Sopwith 1 1/2 Strutter 103 19 minutes.

Bristol Scout , Ill 10 minutes. 1 1/2 hours.

A. W 88 27 minutes. 3 hours.

Sopwith Camel 118 10 minutes. 2 1/2 hours.

D. H. 4 , . 120 11 minutes. 4 hours.

D. H. 9. A 110 11 minutes. 6 hours.

Bristol Fighter 113 11 minutes. 3 hours.

S. E. 5. A 126 10 minute\*. 3 hours.

Dolphin 128 8 1/2 minutes. 1 1/2 hours.

In this development the directing forces had been

Maj.-Gen. E. B. Ashmore, Chief of the London Air Defences, Maj.-

Gen. Sir Hugh Trenchard, the first Chief of the Air Staff, Maj.-

Gen. Sir F. H. Sykes, Lieut.-Gen. Sir David Henderson, Maj.-Gen.

W. S. Brancker. Late in 1917 the Air Forces were merged under

an Air Council with status and powers similar to that of the

Admiralty and its President a member of the Government. Lord

Cowdray was the first Minister and in 1918 the position was held

by Lord Rothermere and then by Lord Weir.

06 July 1918 : The King and Queen Mary, escorted only by three aeroplanes, flew from the Belgian coast to England.

August 1918 : A British aerial dreadnought (Handley-Page) appeared during this month with space for several guns and gunners, a large bomb store-room and a great mass of machinery ; several British universities in this year established Chairs in Aeronautics.

The United States Air Service Board was created on July 24th, 1917, but great difficulties and delays developed in the obtaining of skilled labour, in the getting of material, especially spruce, in the ambition to have a new and unexcelled engine, in obtaining lubricant oils, acetone and linen fabrics. On Jan. 31st, 1918, it was reported to Congress that not a single machine of the exact type planned when Congress appropriated \$640,000,000 in May for an Air fleet would see service in France, but that four types of machines were being manufactured elementary training, advanced training, combatant and bombing. S. G. Blythe in the Saturday Post of Jan. 19th described the situation as follows when it actually came :

" We had no battle-planes. We had

no bombing-planes. We had no high-powered engines. We had

no aeroplanes equipped with the numerous devices war had developed

on the other side. We had 135 aeroplanes, useful for

training and so on, but of no other value whatsoever. the US Senate Military Affairs Committee described conditions

on April 10th as a "disappointing failure" and declared

that the Government had "no broad plan looking to the future

development of war planes." It was stated that only 15 aeroplanes

had been completed and that only one of these was in

France. Dec. 31st, 1917, there were 3,900 officers

and 82,120 men in the U. S. Air Service, that many training

## Notes on "Civil Aviation"

stations were in operation with 24 Flying-fields available, was not satisfying. In the press and in Congress a demand for investigation developed and it appeared that up to February the United States had been purchasing from the Allies such planes as its forces or aviators were using in France totalling from December, 1917, to June, 1918, 2,114 planes. The first American shipment took place in the latter month and, on June 30th, it was semi-officially announced at Washington that 1,316 American aeroplanes were on the Western front, though of these only 323 were combat planes. In July a Senate Committee reviewed and enquired into Aeroplane conditions and the cause of the delays and reported on Aug. 22nd that the original Aircraft appropriation of \$640,000,000 had been "practically wasted" and that not a single American-made offensive aeroplane was yet on the battle-front ; that there had been failure to adopt proved foreign planes and motors, together with unsystematic and ineffective organization; that domination of the Air programme by automobile manufacturers had been allowed while various plans had been partly carried out and then abandoned ; that there had been undue delays in perfecting the Liberty motor, incompetence in the highly-paid inspection service and supervision, and failure to encourage aeroplane producers. The Committee deplored the refusal to use the Rolls-Royce motor or to accept French plans and criticized the various futile efforts of inexperienced men to produce superior types. There were many trails of graft indicated. Late in December the annual Report of the War Secretary included one from Major-Gen. W. L. Kenley, Director of Military Aeronautics, which dealt with the failure in the first year as based upon poor organization and described in general terms the progress made after the 'Aviation Section of the Signal Corps had been reorganized in April, 1918, into the Bureau of Aircraft Production and the Division of Military Aeronautics. John D. Ryan, Director of the Bureau.

The following approximate total of the War expenditures of the Dominions src ref THE CANADIAN ANNUAL REVIEW 1918 pg 210:

Canada \$1,600,000,000  
Australia 1,455,000,000  
New Zealand 377,850,000  
South Africa 115,000,000  
Newfoundland 10,000,000

US General John J. Pershing in his final Report as to the US Army on Nov. 20th, 1918 THE CANADIAN ANNUAL REVIEW 1918 pg 215 "Our entry into the War found us with few of the auxiliaries accessory for its conduct in the modern sense. Among our most important deficiencies in material were Artillery, Aviation, and Tanks. In order to meet our requirements as rapidly as possible, we accepted the offer of the French Government to provide us with the necessary Artillery equipment of 75 's, one fifty-five millimeter howitzers, and one fifty-five G.P.F. guns from their own factories for 30 Divisions. The wisdom of this course is fully demonstrated by the fact that, although we soon began the manufacture of these classes of guns at home, there were no guns of the calibres mentioned manufactured in America on our front at the date the Armistice was signed. The only guns of these types produced at home, thus far received in France, are 109 seventy five millimeter guns.

In Aviation we were in the same situation, and here again the .French Government came to our aid until our own aviation programme should be under way. We obtained from the French the necessary planes for training

## Notes on "Civil Aviation"

our personnel, and they have provided us with a total of 2,676 pursuit, observation, and bombing planes. The first Aeroplanes received from home arrived in May (1918) and, altogether, we have received 1,379. The first American squadron completely equipped by American production including Aeroplanes, crossed the German lines on Aug. 7th, 1918. As to Tanks, we were also compelled to rely upon the French. Here, however, we were less fortunate, for the reason that the French production could barely meet the requirements of their own armies.

The Progress of United States Aviation. No issue received greater public attention in 1917 than American pledges as to Aviation ; no incident caused more disappointment abroad than the failure of expectations in this regard. The War was to be won in the air, it was everywhere said for a time, and American ingenuity, brains and industry would provide the basic elements aircraft and airmen ! There was no question as to the utility of aeroplanes and none as to the necessity. Prior to the American declaration of War there was no preparation along these lines, and S. G. Blythe in the Saturday Post of Jan. 19th described the situation as follows when it actually came :

" We had no battle-planes. We had no bombing-planes. We had no high-powered engines. We had no aeroplanes equipped with the numerous devices war had developed on the other side. We had 135 aeroplanes, useful for training and so on, but of no other value whatsoever. Congress was quick to recognize the importance of this new branch of the Service and promptly passed a law giving broad powers to the Signal Corps and appropriating \$640,000,000 for aircraft, personnel, equipment and the expense of an Air campaign. But we had no idea what to build. We had no standards to go by ; we had no model planes; we had no drawings. We had nothing." Late in December the annual Report of the War Secretary included one from Major-Gen. W. L. Kenley, Director of Military Aeronautics, which dealt with the failure in the first year as based upon poor organization and described in general terms the progress made after the 'Aviation Section of the Signal Corps had been reorganized in April, 1918, into the Bureau of Aircraft Production and the Division of Military Aeronautics. John D. Ryan, Director of the Bureau.

CANADIAN AVIATION - 1919

Interesting point - The United Kingdom may not legislate for a Dominion except by the request and consent of that Dominion.

But the US military did not want an independent National Advisory Council on Aviation (NACA) presence at Langley. In December 1916, the Committee had asked the army for an official designation of property on which it could build its own laboratory buildings, but the army failed to respond. Air Service commanders wanted to maintain control not only over Langley Field but over all experimentation at the field, including that conducted by the NACA. (

January 1919 : U.S Col. Thurman H. Bane, chief of the United States Army Air Service Technical Command, opposes the idea of dual military/civilian control [of aeronautics] so much that he recommends to the army's director of military aeronautics, that all NACA personnel - including civilians - at the NACA facility at Langley Field "be subject to his orders". source ref - ENGINEER IN CHARGE - pg 19

January 1919 : Nineteen twenty-one opens a new year on the calendar, a new epoch in the history of the world and a new hope in the hearts of mankind. In this new era towards which we look forward with confidence, let us resolve that as members of a great profession, we will do all in our power to bring the profession to its rightful exalted position.

May the members of this institute enjoy during this coming year, a period of blessing greater than any in the past, with health, happiness and prosperity in full measure.

January 1919 : THE JOURNAL OF THE ENGINEERING INSTITUTE OF CANADA - Vol. II "Salaries of Engineers"

Correspondence on this subject, published in this and previous issues of The Journal, shows how acute is the feeling respecting remuneration being received by engineers, particularly those employed in the Government service. In many cases salaries received by men doing responsible engineering work have been distressingly low, so much so in some cases, as to be an affront to the profession.

For many years members of our profession, of whom C. E. W. Dodwell, M.E.I.C, of Halifax, is noteworthy, have made earnest efforts to the end that engineers in the Government service should receive recognition as such, and not as clerks, the accomplishment of which would not only give a standing to the engineer in his technical capacity, but would also increase his monetary reward.

A number of years ago a bill was submitted to the then Prime Minister, Sir Wilfred Laurier, by a committee of this organisation, and the promises made at that time led members of The Institute to believe that an Act would be passed placing engineers in the Government employment on a proper basis.

Shortly after, the Government experienced difficulties and went out of power. In 1917 the question was revived and a strong committee of men in the civil service was appointed to go into the subject thoroughly and make recommendations which would raise the standard of the engineer in the civil service.

At that time the hearty co-operation of Council was promised and given. However a change made by the Government in appointing a Civil Service Commission, designed to remove all appointments from the realm of politics, has presented a further opportunity for the engineer to receive recognition. A strong committee of the Council has been appointed, consisting of W. F. Tye, chairman, President H. H. Vaughan and President-elect, Lieut.-Col. R. W. Leonard, to represent The Institute in securing more adequate recognition and remuneration from the Government for engineers.

This committee has made an appointment with the Civil Service Commission, at which time its members will, no doubt, prove to the Commission that the standard of reward for the technical men in the Government service should be raised by a very considerable amount.

## Notes on "Civil Aviation"

In meeting the representatives of The Institute the Commission has shown a willingness to be educated in this connection, and the education they will receive from the committee will work to the advantage of every engineer employed in the Government.

In the reclassification that will take place shortly it is expected that a very substantial increase will be accorded to engineers in the Civil Service

January 11, 1919 : Sir Hugh Trenchard is re-appointed Chief of the Air Staff and Major-General Sir Frederick Sykes is made controller general of civil aviation.

January 14, 1919 : Mr Winston Churchill elevated to Secretary of State for War and Air.

February 12, 1919 " A Department of Civil Aviation was set up with the Air Ministry.

March 22, 1919 : the world's first regularly scheduled international service began operations that linked two cities, Brussels and Paris, under the banner of the Lignes Aériennes Farman

(Lignes Aériennes Farman became the nucleus of Air-France in the nineteen thirties). Flying a mix of Farman Goliaths with Renault power (the F.61) and Gnôme-Rhone-constructed, Jupiter power (in the F.63bis). the Goliath were that it cruised at a solid 70 knots and could reliably achieve 250 miles on every flight. Most flights would not go higher than 10,000 - 12,000 feet, and often lower than that, the Goliath proved on April 3, 1919, that it could carry 14 passengers to an altitude of over 20,000 feet. 60 Goliath's were built [plus four more by Avia in Czechoslovakia under license] Goliaths' were also operated by Cia Aerea Cubana in Cuba and in Colombia.

26 March 1919 : Ottawa : Return to an Order of the Senate dated 26th March. 1919. showing :-

- (1) Whether the Government has divested itself of all aerodromes, airships and air service plant.
- (2) Whether such property is retained by the Government, where it is situated, and of what does it consist.
2. (1) Also, is there any air service organization or personnel in Canada acting under the Government: and
- (2) If there is:
  - (a) of what persons does it consist;
  - (b) what is the qualification and rank of each person ;
  - (c) where are they respectively located;
  - (d) what is each person's duty" (.The Senate.)

17 April 1919 : FLIGHT - EDITORIAL COMMENT Air Terriers A Flight CORRESPONDENT of the Daily Mail advances a most excellent proposal, to the effect that a Territorial Air Force (Air Terriers ) should be constituted.

The correspondent in question, Lieut. F. E. Bussy, late of the R.A.F., points out that there are tens of thousands of highly-skilled and thoroughly efficient flying officers and air mechanics now being demobilised and passing into civil life.

If these men are to be of any use in emergency it is absolutely necessary that they should be kept in practice and familiar with developments in aviation. A flying officer in two or three years will have lost his skill in aerial fighting and bomb-dropping, and he will certainly be unfamiliar with the machines, engines, armaments and instruments which will then be in service. The same applies in equal degree to air mechanics. A month or even a fortnight's training once a year would go very far to enable this valuable material to " keep its hand in " in case of future trouble.

## Notes on "Civil Aviation"

17 April 1919 : FLIGHT : Junior Flight Officers and Cadets

Mr. RAPER asked the Under-Secretary of State for Air whether some thousands of junior flying officers and flight cadets are living at various aerodromes and Royal Air Force stations and doing no work of any useful character; and whether some work can be found for them which will enable these officers and flight cadets to be useful to the Royal Air Force in the future if, and when, a reserve force is formed ?

Maj.-Genl. Seely: About 50 per cent, of the officers and practically all cadets now stationed in the United Kingdom are awaiting demobilisation. My hon. friend may be assured that work of a useful character has been and will be found for those who remain, as far as it is possible to do so.

Technical Officers (Pay)

Sir F. HALL asked the Under-Secretary of State for the Air Ministry whether technical officers are split up into two grades, namely, Category A and Category B ; whether the former receive technical pay and whether the latter do not do so ; whether the duties of those in Category A include compass officers and inspectors of fire services; whether those in Category B include those qualified in armament, chemistry, metallurgy, and photography; if so, whether the duties of those in Category B entitle the officers therein to the same technical pay as those whose duties are to inspect fire services: and whether he will take steps so that both groups of officers are granted the same technical pay ?

Maj.-Genl. Seely: The answers to the first four parts of the question are in the affirmative ; the answer to the fifth part is in the negative. As regards the last part, the whole question of the future emoluments of officers of the Royal Air Force is now under consideration, and an announcement will be made as soon as a decision is reached.

Instructional Flying

Mr. RAPER asked the Under-Secretary of State for Air whether the entire cessation of flying at training stations is due to scarcity of skilled mechanics owing to demobilisation ; and whether flying officers and cadets who have already passed through the technical schools of aeronautics can themselves keep a sufficient number of aeroplanes in flying condition to enable instructional flying to be continued so as to train a number of men for an Air Force Reserve ?

Maj.-Genl. Seely: Scarcity of trained mechanics was one reason for the discontinuance of training, but more weighty reasons were the need for economy and the fact that there are available sufficient trained pilots to meet all probable requirements until the output of pilots commences under arrangements for the Royal Air Force after the War. Flying officers are assisting as necessary in keeping machines in flying condition.

17 April 1919 : FLIGHT : DRAWING OFFICE DATA \*

By E. O. WILLIAMS, B.Sc.Eng. (Lond.), Assoc. M. Inst. Civil Engineers, Assoc. Fellow R.Ae.Soc.G.B.

With the growth of the aviation industry the need for methodisation becomes increasingly important—methodisation in design and

construction as well as in manufacture. With regard to the two first mentioned, as experience is extended the volume grows of data

relating to construction and design, and unless a proper system is evolved for preserving and collating in suitable form such data,

it is almost inevitable that confusion will ensue, or at any rate that full advantage cannot be taken of the experience and data collected in the past for the benefit of the future. Often it will be found that the work involved will be somewhat heavy, especially

as regards design, but it will be found to pay " in the long-run." There is as yet a long way before we arrive at anything approaching

standardisation, hence the number of lengthy calculations involved every time a new design is contemplated is prodigious. So long

as each new machine differs to any considerable extent from the previous one—and at present this would appear to be the case —

all the calculations, aerodynamic as well as structural, have to be gone through afresh. It is not always possible to generalise owing to the difference in shape, size and material of component parts, but much may be done in this direction by making from the start calculations for all such sizes and shapes as may be reasonably expected to come useful for the next series of designs. It is particularly in this anticipation of the next requirements and in the methodical way of presenting them that the series of articles by Mr. E. O. Williams, of which the first is published this week, are useful. The articles do not, except in one or two instances, introduce anything not already pretty generally known, nor do we think that the author lays claim to disclosing any new

discoveries in the bulk of the subjects treated. The articles are, however, the outcome of an attempt to methodise the daily routine

of the drawing office, and, given time, the tabulation of the various calculations would possibly occur to anyone. It is, however, just in this saving of time that these articles will, we feel sure, be found of great assistance. In regard to the tables, graphs, etc., it has not been possible, for reasons connected with publication, to make these all of a uniform size, but so far as has been possible we have endeavoured to do so, so that in the majority of cases readers who wish to do so will be able to tear out these pages and keep them in a loose-leaf pocket-book for easy reference. We regret that since writing this series of articles Mr. Williams has left the aviation industry and has turned his attention to a different branch of engineering. He is now devoting his energies to the restoration of our depleted tonnage—certainly a task of as vital importance as that of building aircraft—but we hope that some day he may be persuaded to return to the aviation world. With these few words of introduction, we will leave our readers to the tender mercies of Mr. Williams.—ED.]

I.—DRAWING OFFICE SYSTEM. (a) System of Numbering Drawings.

THE successful production of complex repetition work, such as the aeroplane, is to a very great extent dependent on the efficiency of the drawing office. Errors in design or draughtsmanship are obviously fatal, but even if the general design is sound, there yet remains a great deal to be done in the drawing office, the quality of which goes a very long way towards making or marring the machine. When, as in pre-War days, only one or two machines of a new type were to be built, the drawings required were, of course, entirely different from those demanded when it comes to orders for large numbers, especially when parts or even complete machines are to be constructed at works other than those of the original designers.

If only one machine were to be built, it would probably be convenient to mass together on one sheet the drawings for all the details referring to a complete unit such as the fuselage. For example, the fuselage drawing would then contain all details such as sizes of longerons, struts, wiring, cockpit, seating, padding, cowling, etc., and all trades would refer to the one sheet of drawings. This procedure becomes impracticable when not one but 1,000 machines are to be built, with a consequent minute division of labour.

The planning of the work is then facilitated if each part has a separate drawing. Also the workman is less liable to get confused if the drawing shows his work only, and he is not required to pick his job out of a multiplicity of other details. This is the basis of the "one part, one drawing" system. Important as is the method of having only one part on one drawing, the systematic numbering of drawings is no less so. The writer has evolved the following system to give effect to the above principles : Each machine is given a distinctive number, and each assembled unit is given an alphabetical letter. For instance : A certain machine has been accepted for reproduction in quantities, and that particular type of machine has been given the

works number 500. Then all sheets, and drawings referring to this particular type will be provided with, firstly, the general number 500, and, secondly, with an alphabetical letter following the number and indicating to what part of the machine the drawing refers. The letter to follow the general number will depend on what system is chosen, and is not, perhaps, so very important so long as the particular system, once decided upon, is rigidly adhered to. The following lettering of drawings will, I think, be found convenient in practice :

General arrangement

complete machine

Fuselage

Wings

Tail plane and elevator

Rudder and fin

Landing gear

Tail skid

Tanks

Engine mountings

and cowling ... j

External wiring ... k

External struts ... /

Controls m

Engine controls ... n

Instrument board ... p

Accessories q

Parts lists r

Stress diagrams

For example, if the general number of the machine is 500, the drawing of the landing gear will be numbered 500/. Detail drawings of the various component parts of the landing gear will then be numbered 500f-i, 500f-2, 500/-3, etc. Another important item as regards convenience and efficiency is the matter of size of drawings. Obviously, it is impossible to have all drawings of one size, irrespective of subject, while it is, of course, equally impracticable to have the different drawings of all sorts of different sizes. It is possible, however, by choosing suitable sizes to reduce the number of sizes to two, one for the general arrangement' drawings and one for detail drawings. The actual size of the drawings is, to a certain extent, a matter of personal opinion, large drawings being preferable in allowing of greater accuracy, while too great drawings become unwieldy to file and handle. In practice it will be found that for general arrangement tracings of machines, a convenient size will be 27 ins. x 50 ins. inside borders, with a f-in. border all around. For detail tracings, a good size is 28 ins. x 36 ins. inside borders, with a f-in. border all around. It will be found convenient to divide up the detail tracings as required to a standard size of 13\ ins. x 9 ins., or multiple thereof, thus dividing up the detail tracing sheet into not more than eight parts. The G.A. tracings should have the full stencil in the bottom right-hand corner, while the detail tracings should have the drawing number and sheet number in the

bottom right-hand corner. All other tracings should have the full stencil in the bottom right-hand corner. Tracers should, of course, be held responsible for their work, and should satisfy themselves that their tracings are accurate copies before handing them in. They should also see that all particulars, such as drawing numbers, etc., are on their tracings. As regards checking of tracings, this should be done by the draughtsman responsible for the drawing traced. (b).—Preparation of Parts Lists, Materials Lists, and Requisition Lists.

It is of vital importance to the speed and economy of a contract that all materials be ordered at the earliest. To omit to order the most trifling detail usually results in serious delay in completing a machine. To avoid this, it is necessary to adopt some systematic listing of parts and materials, and it is suggested that the listing is most conveniently and reliably effected in the drawing office responsible for the original design. (i) Parts Lists.—The first operation is to make a list of every part of the machine on a standard form, such as is shown in Fig. i. This list enables the works office to place out the operations either in the works, or with sub-contractors, in a systematic manner.

(ii) Materials Lists.—From the completed parts lists the Materials Lists are abstracted on to forms such as shown in Fig. 2. This form assists the works office in apportioning the material as it arrives, and also informs each foreman what material he will require.

(iii) Requisition Lists.—The Materials Lists would not be a satisfactory means of communicating requirements to the buying department. Items for similar materials repeat over and over again in the materials lists. For this reason it is necessary to collect in one list, termed the Requisition List, all the requirements of each material required for the contract. For instance, in the Materials Lists 18 gauge plate may occur several times, a few feet here and a few feet there. The object of the Requisition List would be to collect all the requirements of 18 gauge plate in one item, as that is what the buying department would need when ordering.

## II.—STANDARDISED DETAILS.

(a).—Standard Metal Lugs to take A.G.S. Tie-rods and Stream-line Wires.

In the earlier days of the War there was naturally some confusion caused by the absence of any particular specified standards to which to work, the R.A.F. having one standard, the Admiralty another, etc. Now, however, this difficulty has been settled by the universal adoption of what is known as the A.G.S. standard, to which all work executed for the Government has to be made. Under this arrangement standard sizes have been laid down for such details as bolts, nuts, screws, studs, strainers, etc.

In the case of A.G.S. fork ends and universal fork joints, these are so proportioned as to give a certain specified strength, and for maximum efficiency the wiring plates or lugs connecting the fork ends to the spars, struts, etc., should have strengths not less than the specified strengths of the fork joints. Each A.G.S. fork end has a given size of pin. For instance, the 1-in. A.G.S. fork joint has a pin of 1 1/4-in. diameter. The load from the fork joint is transferred to the lug by the bearing pressure of the pin on the metal part of the lug surrounding the pin. The intensity of bearing pressure must not exceed a certain limit fixed by the quality of the material of which the lug is made. For 26-ton mild steel plate, the maximum allowable bearing pressure should not exceed 35 tons per square inch of the projected area of the pin in contact with the plate. Let  $f_b$  be the allowable intensity of bearing pressure in tons per square inch,  $t$  inch (see Fig. 4) be the thickness of the lug,  $d$  be the diameter of the pin, then strength of lug as limited by bearing pressure =  $f_b \times t \times d$  tons. Let  $F$  be specified strength of fork end in tons per square inch, then  $f_b \times t \times d$  should equal or be greater than  $F$ . The diameter of pin,  $d$ , is fixed by the A.G.S. standard design.

\* This article, which was written some time ago, has not been released for publication until recently. It has not, however, lost in interest during the interval.

25 April 1919 : Parliament, Ottawa : CONTROL OF AERONAUTICS-APPOINTMENT OF AIR BOARD <sup>123</sup> - On the motion of Hon. A. K. Maclean Bill No. 80 to authorize the appointment of an Air Board for the control of Aeronautics was read the second time and the House went into Committee on the Bill, Mr. Boivin in the Chair. On section I-Short title:

Henri Sév  rin B  land - Laurier Liberal - Has the minister given a general explanation of this Bill?

Alexander Kenneth Maclean (Minister Without Portfolio) Unionist : I really cannot say anything more than is stated in the Bill which I explained briefly on its first reading. Obviously there must be some development in commercial aeronautics in the immediate future. During the war the development in aeronautics related almost entirely to military and naval affairs. Private and commercial aeronautics was prohibited altogether and consequently there was no development along these lines. It is necessary, in view of the probable development of aeronautics, that there should be some governmental control of such matters and it is proposed to establish a Board which shall have entire control of any Government or commercial service. If my hon. friend will look at section 3 he will see there set forth the duties of the Board which will cover fully, I think, all the probable activities in aeronautics. Section 4 is the other important clause and that empowers the Air Board to establish regulations for the control of aeronautics. Mr. A. K. MACLEAN: It is not proposed to establish another department to administer this Act. I would suppose that most of the members of the Board would be selected from established departments of the Government. The administration of the Act will be largely in the hands of the vice-chairman of the Board who will be the chief executive officer. It is necessary, of course, to have representatives of the Naval and Militia Departments upon the Board for the reason that heretofore they have been very much and practically interested in aeronautics. Consequently it is proposed that they shall have direct representation on the Board. It might be urged that the Post Office Department, the Interior Department, the Dominion Police and some other departments should be represented on the Board. However, there was a reason at the moment existing for the representation of the two departments I have mentioned and it is not deemed advisable that other departments which may possibly be interested in aeronautics in the future should all be represented on the Board. But, it will be understood that this measure is of a temporary

---

## Notes on "Civil Aviation"

nature. I have no doubt that in the working of it during the coming year weaknesses will develop but experience will enable us to pass legislation which will be more satisfactory.

Mr. (MORPHY: I have listened to the statement of the minister and I would judge from it that his intention is to set up a theoretical Board rather than a practical one. Otherwise, he would have stated the fact that we have a large number of the finest Canadians who have ever done service for their country many of whom have returned to Canada after real practical service on the battlefields of Europe. While there may be men who have been employed with the military and naval services in Canada this is a very opportune time of recognizing the boys who have been fighting for their country, and doing good practical work, and of calling to the service of the country some of these young men who fought for it. I will leave that with the minister. I think that there should be some recognition given to these boys who have done their duty overseas.

Alexander Kenneth Maclean : Doubtless *the class to which my hon. friend refers* will be represented on the Board.

Mr. Henry Herbert Stevens : Will the minister kindly state if it is in the mind of the Government that this Board shall at an early date undertake the commercial development of aeronautics, not with the idea that it is to be merely an adjunct of military and naval development but with the idea of taking up definitely the commercial development?

Mr. A. K. MACLEAN: If my hon. friend is inquiring whether the Government intends entering into the field of commercial aeronautics, I am bound to reply that it has not yet considered the matter from that aspect. The operations under the Act will, of course, largely relate to commercial activities; I would expect that for the next few years, at least naval and military activities in aeronautics will be very limited, indeed

Mr. J. H. SINCLAIR: I do not think the minister has given the Committee very much information as to the functions which this board is to perform. I have not got any clear idea as to whether it is simply to manage aeronautics in connection with private enterprise, or whether it is to embark upon some large scheme of its own.

Mr. CAHILL : Has the Government any idea with respect to its future policy on the subject of aeronautics?

Mr. McKENZIE: Is it intended, in connection with the operations of this board, to establish an institution or school where practical and theoretical instruction in aeronautics will be imparted so as to render a man thoroughly competent to take charge of an aeroplane?

Mr. A. K. MACLEAN: Up to the present moment it is not the fixed or settled policy of the Government to establish a school for the purpose indicated. Speaking generally, the Government has no settled policy in respect to aeronautics.

The Militia and Naval Departments, during the period of the war, carried out a programme, but it has now practically ceased. It was necessary to first enact legislation before any fixed policy could be adopted by the Government in respect of any form of aeronautical activity.

Many applications have been received from commercial companies for the establishment of aeronautical routes throughout Canada; and, as I said a moment ago, it is open to the Government to embark upon various forms of aerial activities, such as the conveyance of the mails, the survey of forest, fire protection, patrols by the mounted police, and so forth, but at the present time, the Government has reached no definite policy in respect of any of these matters.

The immediate purpose of this legislation is chiefly to control aeronautics in Canada, established by any Government department or by private corporation. For example, it is not within the right of any individual to fly in the air with aeroplanes or hydroplanes, or any other machine of the kind, although there is no statutory law which directly prohibits it.

Mr. McKENZIE: It is entirely unknown to the common law.

Mr. A. K. MACLEAN: It is unknown to both the common law and the statute law. Consequently, nobody can legally engage in flying to-day, and in none of the provinces, nor in Canada, is there any statutory authority for any body to grant licenses for the purpose. This board must establish aerial routes, or to put it in another way: If a commercial company desires to carry on an aerial service between, say, Montreal and Toronto, their route should be first established and that would be one of the functions of the board. The machines used should be licensed and inspected just as a steamer is. The pilots and the crews must also be licensed, and that will be another function of the board. Furthermore, regulations must be enacted, compelling flying machines to use telephonic or wireless apparatus, and in relation to many other matters which do not occur to my mind at the present moment. I think a very close parallel to the control of aerial navigation is the control which we exercise over shipping, with, of course, the very notable difference that one operates on water and the other in the air. Generally speaking, the object of the legislation is to put

## Notes on "Civil Aviation"

ourselves in a position to control aeronautics, chiefly commercial, as that is the form we shall likely have in the immediate future in Canada.

Mr. EKNEST LAPOINTE: By this Bill, according to the minister, Parliament is establishing its authority over aerial routes and all matters concerning air craft. But does my hon. friend think that if a company, for instance, established a line between Montreal and Quebec, to operate exclusively within the limits of that province, it would be a provincial matter, and that the company in question should not come under the authority of this Parliament unless its undertaking is declared to be for the general advantage of Canada?

My hon. friend classifies aerial navigation with marine navigation, but article 92 of the British North America Act declares that a provincial legislature may exclusively make laws in relation to the matters coming within the class of subjects "hereinafter enumerated," and article 10 of section 92 sets forth: Local works and undertakings other than such as are of the following classes:- Lines of Steam or other Ships, Railways, Canals, Telegraphs and other Works and Undertakings, connecting the Province with any other or others of the Provinces, or extending beyond the limits of the Province.

Therefore if such a company were operating exclusively within the limits of one province it would be a provincial matter, and I do not think this air board could fix the route, or control the license to pilots, and other matters in connection with it.

Mr. A. K. MACLEAN: The constitutional question, of course, arises in connection with this matter, and had it been pointed out to the Fathers of Confederation that we might possibly have this aerial development in later years, it would be difficult now to say whether it would have been placed in clause 91 or 92 of the British North America Act.

Clearly, the legislation, if enacted, would cover interprovincial aeronautics, and consequently to that extent the Federal Government would have control. Whether it has control over purely provincial aeronautics is a question open to very much doubt, and possibly it will have to be settled ultimately by the courts.

There is a clause in the British North America Act which in effect states that subjects not assigned to the provinces fall within Federal jurisdiction.

Aeronautics were not placed in the list of subjects assigned to provincial jurisdiction, and therefore it is arguable that the subject falls within Federal jurisdiction.

However, any doubt we may entertain on the point does not affect the competency of Parliament to pass this legislation, although later it may be held by the courts that it is only *intra vires* in so far as it affects interprovincial aeronautics.

Mr. LEMIEUX: Yes. I think the objection of my hon. friend from Kamouraska (Mr. Lapointe) was well taken. It seems to me that as the Government is so anxious to have Government ownership of all kinds of transportation, it should not lose this favourable opportunity of furthering that project.

There is no incubus attached to aerial as there is to railway transportation, and the Government should take control of this new industry, which no doubt will develop to a very great extent in the near future.

The British Government have already organized an aerial postal service and have mapped out three routes, one for freight, another for passengers, and a third for some public service, I think the postal service.

The United States also have organized a postal service between Philadelphia, Washington and Baltimore.

Mr. LEMIEUX: This may be only a tentative service.

Mr. A. K. MACLEAN: I think it is experimental.

Mr. CAHILL: Will this board be empowered to grant licenses to any persons who wish to establish lines between Ottawa and Toronto, or between other points?

Mr. A. K. MACLEAN: Yes.

Mr. LEMIEUX: Were there any Canadians associated with the American who bought the whole of the aerial property in Toronto?

Major-General MEWBURN: I do not know that there were. Col. Bishop told me that he expected to be interested in some British machines for which he was offered the agency, and while he had not worked out just what he was going to do, he hoped to be able to develop in this country some commercial enterprise, possibly in conjunction with the postal service. ***This Air Board is only a temporary one to study the question***, and the Department of the Naval Service is represented on it merely to keep in touch with a view of developing something in the future.

Mr. LEMIEUX: I would suggest that the minister have Col. Bishop on the first aerial board in Canada.

William Sora Middlebro: I should like very strongly to second the suggestion of the hon. member.

Col. Bishop is a native of my town and is a son of my former legal partner.

I have known him from the day he was born to the present time, and he is to-day the world's champion living airman, having brought down seventy-two aeroplanes.

He is a boy of whom any country might be proud, apart altogether from his ability and record as an airman.

## Notes on "Civil Aviation"

I would respectfully suggest that anything that can be done by the minister to secure his services on this Air Board would be one of the best moves the Minister of Militia could make. I understand *he served for a time on the Administration Board in connection with the air service in London, England, and would be admirably qualified for the position*, though I do not know if he would accept it at the present time.

Major-General MEWBURN: I do not think any salary the Militia Department could offer Col. Bishop would induce him to take such a position. I have had many consultations with him, but at the present time he is making something like \$30,000 a month under contract in the United States.<sup>124</sup>

Mr. COPP: Under subclause (b) of section 3 this Air Board can travel throughout the whole country studying this question, without let or hindrance on the part of any one. They may go even into other countries, as they see fit.

Under subclause (c), they have power to construct and maintain all Government aerodromes and air stations, including all plants, machinery and buildings necessary for their efficient equipment and upkeep.

In these two clauses, the approval of the Governor in Council is apparently not necessary, and I should like to know whether or not it is the intention of the Government to give such wide powers to this Aerial Board.<sup>125</sup>

Mr. A. K. MACLEAN: The purport of subclause (b) of section 3 is merely a direction to the Air Board to take cognizance of and to study aeronautical development in all countries of the world.

It does not imply that the board is to travel as a body to do research work in connection with this matter. It might conceivably at some time be desirable for a member of the board to visit some countries to study the development there taking place, but I do not anticipate that much in the way of travelling will be done by members of the board for a considerable time.

I think, however, it is a very proper provision that members of the board be directed to study the development of aeronautics in all countries in the world.

Section 7 says that all the moneys proposed to be expended under this Bill must be voted by Parliament, so that Parliament will have control over the matter.

The purport of subclause (c) is to place in the hands of the Air Board the absolute control of the construction and operation of any air service owned by the Government.

If the Post Office Department should decide to establish a service between Halifax and Newfoundland, or (Halifax and Charlottetown or Halifax and St. John the control of the service would be in the hands of this Board.

The Board will also control any services which originate in either the Naval Department or the Militia Department, and this clause places in the hands of one body all matters relating to aeronautics. I

trust that this will commend itself to the judgment of my hon. friend. For the time being it seems the best thing to do.

D and E are similar in character to C: it simply gives the Board the control and management of all aircraft and equipment necessary for the conduct of any of His Majesty's services.

Possibly the Government may establish other services of its own, but in any event, such services when once established, and so long as this legislation stands upon the statute books, will be under the control of the Air Board.

Mr. COPP: I quite agree with the minister that such legislation should be passed at this session. Aeronautics are only in the experimental stage and it is but right that opportunities should be given to develop this service if it becomes of commercial value to the country. I would suggest, however, that we surround it with adequate safeguards, particularly in connection with the expenditure of moneys. I fear that if money is expended without the approval of the Governor in Council a very much larger expenditure will be incurred than the Government or this Committee foresees at this moment.

Mr. A. K. MACLEAN: The Governor in Council will exercise a very critical control of expenditures. Clause 7 of the Bill reads: All salaries mentioned herein and all expenses incurred under the provisions of this Act shall be paid out of such money as may be appropriated by Parliament. Therefor the authority of Parliament must therefore be obtained before any money can be expended.

Mr. J. H. SINCLAIR: By this section the Departments of Militia and Naval Affairs are associated with this Board. Which department will it come under?

Mr. A. K. MACLEAN: Both

Mr. J. H. SINCLAIR: What minister will be responsible for the administration of this board?

---

<sup>125</sup> <http://www.lipad.ca/full/1919/04/25/236/>

## Notes on "Civil Aviation"

Major-General MEWBURN: That is not settled. There will be a representative of the Militia Department on the board.

Mr. A. K. MACLEAN: As my hon. friend (Mr. Mowat) in closing, referred to the necessity of legislation at this session, I would like to emphasize the statement a little farther and say -that I am very anxious to have the Bill become law at once and that I shall probably ask His Excellency's assent to this Bill long before the closing of Parliament. I do not desire to amend the Bill with a view of abrogating any of the common law doctrines in respect to property rights in the air. In view of recent developments, the point is one for the courts to determine but I doubt very much if that doctrine would be held to have much validity under the circumstances. I would refer my hon. friend to paragraph (i) of section 4 which reads as follows: (i) the institution -and enforcement of such laws, rules and regulations as may be deemed necessary for the safe and proper navigation of aircraft in Canada or within the limits of the territorial waters of Canada; The subsection 3 immediately below reads as follows: (3) All regulations enacted under the provisions of this Act shall be published in the Canada Gazette, and, upon being so published, shall have the same force in law as if they formed part of this Act. The important thing to have in mind in aerial navigation is the protection of life and property, and I have no doubt the board will provide by regulation that no flying machine shall approach the ground, or approach a building, within a certain number of feet. I have heard the story frequently, and I assume it is a fact, of somebody when flying in the city of Vancouver entering a bedroom where a patient was being attended by a -doctor; the machine and pilot landing in the bedroom. We will seek to avoid the repetition of such a discourteous act as that by providing a regulation that -the flight of -the airplane shall be of a certain height in order to safeguard, so far as is possible, the safety of property and person. I submitted the Bill to the Justice Department before introducing it, and was told that the measure was perfectly constitutional and about the best that could be done to meet the situation for the time being.

Mr. McKENZIE: I think it is only fair when we are dealing with so practical a phase of the development of aeronautics as the present, that I should suggest to the minister that he would-in connection with this board and in connection with any legislation on this subject-enlist the sympathy and help of the father of aeronautics in this country, I refer to Dr. Bell, who has a home at Baddeck, N.S., although he sometimes resides in Washington. I had the pleasure in September 1896 of being present in the machine shop experimenting office of Dr. Bell in the town of Baddeck, when it was considered a great achievement in aeronautics that he could cause a certain machine that he had in his laboratory to rise three or four inches from the ground.

It is gratifying to know that we have today reached such an advanced stage of development in aeronautical science. Dr. Bell is a Canadian, born in Brantford in the great province of Ontario and is well known, and he spends about ninety per cent of his time at his beautiful home in the neighbourhood of Baddeck in the county which I have the honour to represent, and I think it would be only fair on the part of the Government to recognize his great services, the great research he has displayed, and what he has done for this science. The first airship that was ever built in Canada was constructed at his workshops at Baddeck, and did considerable flying. It was operated by a Baddeck boy, young McCurdy, who was famous afterwards as a flier and who was in charge of some of the works at Toronto or Camp Borden in the early stages of the war. I do not know where young McCurdy is now.

Major-General MEWBURN: Long Branch.

[Section 4-powers of Air Board to make regulations *with approval of Governor in Council* - agreed.

Section 5 provides that the board shall have *power to control the places in Canada* where a landing may be made from a foreign country.]

A. K. MACLEAN: The purpose of this clause is to provide for the control and discipline of those employed in connection with the Government service. For instance, if it was an air service in connection with national defence, the Air Board would acquire these powers, which are somewhat similar to the powers enjoyed by the Naval Department and the Militia Department. If the service had something to do with policing the un-organized territories of Canada, it would probably be necessary to house and clothe our men. The powers are very general, but important and necessary.

08 May 1919 : FLIGHT : Civil Aeronautics in Canada : THE Bill providing, for the control and encouragement of flying in all its aspects, the issue of licences, inspection of machines', and arrangement of air routes has reached its third reading in the Canadian Parliament. It is proposed to make the control of commercial flying a public monopoly

19 May 1919 : at the government house at Ottawa : presents his Excellency the Governor General in council. His Excellency the Governor General in council, on the recommendation of the minister of the naval service, is pleased to order and it is hereby ordered that the falling addition and alteration are hereby made to P.C. 269 of 8 February of 1919, viz:- In all cases where the letters "RCN" and "RNCVR" appear, the letters "RCNAS" (i.e. Royal Canadian Naval Air Service) are hereby inserted immediately after the letters RCN. [...] Rudolphe Boudreau - Clerk of the Privy Council. source ref Canada Gazette volume 52, number 48, 31 May 1919, page 12 - 1919 pg 3688 - 3689.

## Notes on "Civil Aviation"

27 May 1919 : Minutes of a Meeting of the War Cabinet, held in Mr. Bonar Law's Room, House of Commons, London, UK<sup>126</sup>

The Imperial British War Cabinet had before them a memorandum by the Under - Secretary of State for Air ( Paper G.T. - 7332) regarding the proposed transfer of aeroplanes by the Royal Air Force to Dominion Governments.

The memorandum stated that the Air Council had had before them a request *from the Canadian Air Force* [in Britain] for the presentation to that Force of ninety-two aeroplanes and engines *to assist the Canadian Government in starting a permanent Air Force.* <sup>127</sup>

The UK Air Council thought this request *should be considered as part of the general question* of whether, and if so, under what conditions, *the Governments of the Dominions should be assisting in initiating independent military Air Forces,* <sup>128</sup> a similar question having been raised on behalf of South Africa.

The British fully expected the gift to be used in "jump starting" air forces throughout the Empire, and the initial types offered were limited to:

de Havilland 9 and 9A,

Bristol Fighter,

SE.5,

Salamander,

Dolphin, and

Avro 504s. <sup>129</sup>

The lists of "available machines" changed frequently, while the recipients dickered over the selection. <sup>130</sup>

At times there seemed to be "no plan to Dominion requests", as when the Canadians suggested a single Handley-Page O/400 and a "Super Handley-Page" (presumably a giant V/1500).<sup>131</sup>

The view of the Air Council <sup>132</sup> was that:

1. "a free gift of a certain number of machines should be made".
2. In this way the pressure on storage space on account of the number of machines which there was no prospect of selling until they had become practically useless would be alleviated to some extent, and
3. this course was recommended by the fact that, in the view of the Disposal Board, when every demand which could reasonably be foreseen was met, there would still remain a considerable surplus of machines of certain types which would not have a higher value than scrap value because they had become obsolete or deteriorated through storage.

This Document was the Property of His Britannic Majesty s Government - classified as SECRET until 1970

## Notes on "Civil Aviation"

The Under - Secretary of State for Air said <sup>133</sup>:

1. that he proposed, with the approval of the War Cabinet,
  1. that when the Air Council had in stock 500 or more machines of any one type surplus to active and reserve requirements of the Royal Air Force, or
  2. that when the Air Council had in stock 500 engines of any one type surplus to active and reserve requirements of the Royal Air Force,that power should be given to put a number not exceeding 100 "at the disposal of a Dominion", free of cost.

The First Lord of the Admiralty said that:

1. the Admiralty were asked to give ships to the Dominions, and
2. the Admiralty proposed to do so on the same principle so long as the loss to the United Kingdom would not exceed a reasonable sum.

The Secretary of State for India thought:

1. that if the Cabinet agreed to the Under-Secretary of State for Air's proposal, India should be included with the Dominions.
2. that if the Dominions were given free gifts of aeroplanes, India should not be expected to pay for hers.

Mr. Bonar Law said:

1. that he saw no objection to General Seely's proposal.
2. He thought, however, the fact that we were making a gift of aeroplanes to the Dominions and India should be made widely known to the public.

The Under-Secretary of State for the Colonies said:

THAT A NUMBER OF COLONIAL GOVERNMENTS AND PROTECTORATES WOULD BE GLAD OF THE GIFT OF A FEW MACHINES.

The War Cabinet decided <sup>134</sup>:

1. to approve of the Under-Secretary of State for Air's proposal that "a gift of aeroplanes not exceeding 100 should be made to each Dominion and India", and
2. that a gift of a few machines should be made to any colonial Government or protectorate requiring them.
3. These machines would be in addition to those to be returned to the Dominions free of cost to replace the machines given by the Dominions during the war.
4. That the Under-Secretary of State for Air should arrange for adequate publicity to be given this action by His Majesty's Government.

this 100 aircraft gift was soon exceeded, and more than 100 aircraft were sometimes sent.

03 May 1919 : FLIGHT The Accident to Gen. Sykes : AN aeroplane taking Maj.-Gen. Sir F. H. Sykes, Controller-General of Civil Aviation, to Paris, met with an accident on the afternoon of May 3, at Kenley. The pilot, Capt. E. M. Knott, A.F.C., was killed. Maj.-Gen. Sir F. H. Sykes was badly shaken, but was able to motor to London. He was removed in the evening to a private nursing home, and is making good progress. The accident happened at a height of about 50 ft., soon after the machine had begun to leave the ground. Gen. Sykes scrambled out of the machine, and extricated Capt. Knott, but the latter was so severely injured that he died on his way to the hospital.

Forest Protection in Canada : MR. STUART GRAHAM, who was a naval air pilot in the R.A.F., has arrived at Ottawa to take charge of two planes released by the Canadian Department of Naval Affairs for forest protection in Quebec

08 May 1919 : FLIGHT : RAF Capt. J. Alcock, D.S.C., who received his technical engineering education at the Empress Motor Works, at Manchester. He took the Royal Aero Club's Flying Certificate at Brooklands in 1912, and rapidly rose to the head of his profession, taking part in a large number of the early competition flights, amongst others the well-remembered race London to

## Notes on "Civil Aviation"

Manchester and return in 1913, in which he secured second place. At the outbreak of War he immediately joined the R.N.A.S., and was posted to Eastchurch as an instructor. Later he became the Chief Instructor of the Aerobatic Squadron. He did valuable work on the Turkish front, where he won the D.S.C., and held the record for long-distance bombing raids. He was eventually taken prisoner by the Turks owing to an engine failure, and remained as such until the end of the War

and RAF navigator, Lieut. Arthur Whitten Brown, A.M.I.E.E. M.I.M.E., A.M.F A.I.E 1886, an engineer by profession who received his practical training with the British Westinghouse Co., [now allied with the Vickers Co.] Royal Flying Corps observer wounded and taken prisoner of war in 1915, repatriated in December 1917, since which time he has been engaged with the Ministry of Munitions on the production of aero engines, and has put in a considerable amount of flying at home stations. He is also a pilot of some experience, and has flown many types of machines.

MAY 8, 1919

FLIGHT

THE VICKERS "VIMY-KOLLS."—Three-quarter front view. The machine will be piloted by Capt. J. Alcock, D.S.C., and the navigator will be Lieut. A. W. Brown, whose article on elementary navigation was published in "Flight" recently

08 May 1919 : FLIGHT : THE Air Ministry makes the following announcement :•—

### 1. Air Navigation Regulations

- The official Air Navigation Regulations (printed below) apply to the United Kingdom only.
- They do not permit of civil aircraft flying from England across the Channel to any foreign country, and are not applicable elsewhere than in the United Kingdom.
- Overseas civil flying will not be possible until the International Regulations for the Control of Aviation are published.

### 2. Airship and Balloon pilots

- The regulations dealing with airship and balloon pilots are not yet completed.

### 3. Air routes and Aerodromes.

- The air routes and aerodromes so far selected are necessarily tentative, and their permanent retention depends on the value of this newly inaugurated system justifying the cost of maintenance.
- This consideration accounts for the fact that at present only two official aerodromes in Scotland are included in the list and none in Wales.
- With the growth of civil aviation and the increasing output of aircraft it may be desirable to open up fresh aerodromes.

### 4. Prohibited Areas.

## Notes on "Civil Aviation"

- The list of areas over which flying is prohibited given in Schedule 6 of the Air Navigation Regulations was drawn up to meet war needs, and will remain in force pending the conclusion of peace, when it is hoped that they will be much reduced.
- A further announcement on the subject will be made in due course.

### 5. Accommodation at Aerodromes.

- At each aerodrome, mentioned in the list published on April 25, a hut, or part of a hut will be placed at the disposal of civilian aviators as an information bureau, and an officer will be detailed to give information and render every assistance to those requiring it.
- Information as to the cost of petrol, oil, etc., will be posted up inside the hut, and it is hoped that a regular service of meteorological bulletins and other useful information will shortly be available.
- These huts will be clearly marked with the letters C.A.T.O. (Civilian Aviation Transport Office).

### 6. Aerodromes - Hangars

- Owing to the shortage of labour and other causes it has been found impossible to equip certain of the specified aerodromes with suitable accommodation for machines by May 1.

### 7. Inspection of Aircraft at Aerodromes.

- It will be noted that a necessary part of the aerodromes management is the provision of licensed ground engineers.
- As there has not yet been time for firms to provide these, the A.I.D. has been called upon, as a temporary measure, to provide a certain number of skilled personnel to assist.
- It must be remembered, also, that it is only from aerodromes where licensed ground engineers are located that aeroplanes can start.

### 8. Military Markings.

- The bulk of machines which will at first take part in civil flying, having been built as Service machines, are marked with red, white and blue rings, and bear Government numbers.
- The existing Government numbers will be allotted to these machines as temporary registration marks.
- When permanent marks are allotted the old registration numbers must be erased and the new permanent marks put on within 14 days of allotment.
- Owners of aircraft upon which the service ring markings are painted must obliterate them.

### 9. Petrol and Oil.

- Petrol, oil and small spare parts, such as sparking plugs, etc., will be purchasable.
- The following retail prices have been fixed :

### 10. Accidents.

- Accidents to all aircraft other than those of a minor nature must be immediately notified by telegram to the Air Ministry (Accidents, "The strand" London), with a view to preliminary enquiry into the nature of the accident.
- This notification will be made by owners, their representatives, or the Civil Authority.
- The Air Ministry will then decide whether detailed investigation is required.
- Until the decision of the Air Ministry has been given, the wreckage of any machine to which an accident has occurred must not be disturbed.
- A formal release for the removal of the wreckage will be given by the Air Ministry.

### 11. Air Licenses

All applications for licenses of every class, aerodromes, air-worthiness of machines, pilots, ground engineers, etc., should be addressed to the Air Ministry (C.G.C.A.).

June 1919 : USA : MECHANICAL ENGINEERING : The Journal OF THE Am.Soc.OF M.E. : pg 40a : Aeronautics - Regulations : Regulations for Air Navigation. Automotive industries, vol. 40. no. 15, Apr. 10, 1919, pp. TS2-785. Project of Int. Convention regarding air navigation.

05 June 1919 : Parliament : UK : Parliamentary discussion re R.A.F. Officers Category "A" vs. Category "B" Technical Pay" <sup>135</sup> :

---

<sup>135</sup> Flight 05 June 1919 pg 749

## Notes on "Civil Aviation"

Lieut.-Col. Sir F. HALL asked the Under-Secretary of State to the Air Ministry the following :

1. whether any decision has yet been arrived at as to awarding technical pay to officers in Category B of the Royal Air Force;
2. whether their duties are of less importance than those of the officers in Category A ; and
3. whether, when a decision is arrived at, in the event of it not already having been reached, emoluments will be made retrospective to temporary officers as and from the date of the Air Ministry Order of September 26, 1918 ?

Maj.-Genl. Seely responded : This matter has been very carefully considered, and it has been decided not to award technical pay generally to officers in category B, as their duties do not involve the same standard of technical knowledge as those of officers in category A.

05 June 1919 : Parliament : UK : Parliamentary discussion re Surplus R.A.F. Aeroplanes <sup>136</sup>

Col. ASHLEY, on May 29, asked the Under-Secretary of State to the Air Ministry if he will offer to the Overseas Dominions and Colonies some of the surplus aeroplanes now in the possession of the Air Ministry, with a view to their being used for postal and similar services ?

The Under-Secretary of State for Air (Maj.-Genl. Seely) : This question is at this moment being considered. Perhaps my hon. and gallant friend will repeat his question next week. Since I drafted this answer a satisfactory conclusion has been arrived at by the Government and I hope to make a satisfactory announcement when the hon. member repeats his question.

Lieut.-Col. Ashley : Will this be given as a free gift or will it be a purchase?

Maj.-Genl. Seely: As a free gift to the Dominions, the Crown Colonies and to India.

Lieut.-Col. Sir Samuel Hoare asked the Under-Secretary of State to the Air Ministry whether, in view of the high prices now being realised for obsolete and old motor cycles and cars being sold by Government Departments, it would be desirable to offer some of the new aeroplanes, now being broken up by his Department, to the public by auction sale so as to test the market on this matter ?

Maj.-Genl. Seely : The aeroplanes which are being reduced to produce are those which are obsolete for war purposes and unsuitable for civil aviation. His Majesty's Government accordingly could not accept the responsibility of putting them on the market. The responsibility of the Air Ministry ends when they have decided what machines are surplus and which of them are obsolete for service use and unsuitable for civil aviation. Thereafter the question of disposal rests with the Disposal Board under the Ministry of Munitions.

Lieut.-Col. Sir S. Hoare: Why could not the right hon. gentleman put some of these on the market to see if there is a demand for them, and at the same time make it clear that any purchaser purchases them at his own risk ?

Maj.-Genl. Seely : That is a matter for the Disposal Board of the Ministry of Munitions, and questions on that subject should be addressed to them.

Lieut.-Col. Moore-Brabazon : Have steps been taken to dispose of some of these machines to neutral countries for trade purposes ?

Maj.-Genl. Seely : I have just announced the decision of the Government to make a free gift to the Dominions, Colonies and India of those required for certain specific purposes, but the disposal of the machines is a matter for the Disposal Board of the Ministry, and I shall be obliged if the hon. and gallant gentleman will address his questions to them, as they have all the facts at their disposal.

We are very pleased with the announcement: that it has been decided to in- Aeronautics institute a Chair of Aeronautics at the London University, tenable\* at the East London College. We believe this has been in contemplation for some little time, but that the ^ consummation of the idea has been delayed in consequence of more or less active opposition from quarters in which we should have expected welcome and assistance for any scheme for the f&ptherance of scientific study in connection with aeronautics.

There is no need for us to be any more specific than -this just now. There may be more to be said about ^ he official attitude towards the professorships later on, but for the moment it is enough to say that there has been some amount of totally inexplicably Opposition. It may be as well to say that the foundation of the Chair has absolutely nothing to do with the Zaharoff gift for the establishment of a similar, chair at one of the older Universities—a matter which those responsible for the administration of the gift do not appear to have seriously approached as yet.

This is a matter which concerns the University of London alone, which has, entirely of its own initiative, arrived at the conclusion that the scientific study of aeronautics should be at once placed on a sound and proper basis, under the guidance of a competent scientist, and that it is the business of the University to do what it can to assist in filling the hiatus.

We need hardly say that We welcome the action of the University. There are at the present moment hundreds of young men, highly qualified pilots many of them, who are desirous of adopting aeronautics in one or other of its phases as their life's career.

---

<sup>136</sup> Flight 05 June 1919 pg 749

## Notes on "Civil Aviation"

They know all there is to be known about the purely practical side of flying, but are very children in its scientific bearings. To such the new departure of the London University means a great deal. It will place at their disposal a highly scientific training with the hall-mark of a London degree at the end for those whose aspirations lead them that way.

In every case it promises to raise the standard of aeronautical study to a very much higher plane than it has occupied hitherto. By the way, and while we are on the subject of scientific training, what has become of the memorandum which the Air Ministry was supposed to be going to issue some time ago? And has the delay in its issue any bearing on the opposition to the East London professorship of which we have spoken? It would be interesting to know.

Aeronautics at London University : AT the meeting of the Senate of London University on May 28, it was resolved to institute a Chair of Aeronautics tenable at the East London College. This is in addition to the Zarahoff Chair of Aviation at the Imperial College of Science and Technology, the first appointment to which has still to be made, although the requisite funds were given to the Government nearly two-and-a-half years ago. We refer further to this matter on page 726.

The Air Ministry Headquarters. : THE Civil department of the Air Ministry now has its headquarters at India House, which is to be the permanent home of the Air Ministry, and the military departments will soon be transferred there. At present the fifth floor of India House suffices, but it is anticipated that eventually the corresponding floors in Empire and Canada Houses will be required page 734

### The Flying Clubs institution

We are glad to see the idea of Flying Clubs is spreading. We do not mean the ambitious schemes which are on foot in some parts of the country, which include the possession of palatial hotels or clubhouses, but the banding together of a few men of moderate means to share the cost of small aerodromes and a machine or two for communal use.

It is suggested that the best way to do this would be to form a large number of such clubs, affiliated to some central body. The Royal Aero Club, we suggest, might, say what it thinks of the idea. In this way arrangements might be made.'

With a large number of aerodromes all over the country, and members could making flying week-end visits from one to the other on machines in which each member's share would be comparatively small.

A certain number of trained mechanics might be required, but, probably a good deal of the overhauling and repair work could be done by the members in their spare time whilst the regular staff of the aerodromes would no doubt always be available for emergency.

This opens up quite a tempting prospect.

The cooperative idea is good and we think would work reasonably well. Rigid methods of inspection of such machines, however, would be a necessity, else we fear the toll of accidents might be initially heavy.

We are not altogether enamoured of the machine which has been overhauled and repaired in spare hours by amateur mechanics who may or may not know anything about the job.

Youth in particular is apt to chance things a little too much, and it would obviously be to the youth of the country that the idea of the flying club would appeal most.

However, this, is a detail which we doubt not can be easily provided against and does not in the least militate against the basic idea of community of interests in flying.

As a matter of fact, we regard the idea as essentially valuable, inasmuch as it can. Only be through something of the sort that flying can more quickly be brought within the reach of the man of restricted means.

Without such, organisation of the pleasure side of aviation, it may have for years to come to remain the pursuit of the privileged few who are able to command a good deal of money and who do not mind spending round sums on a favourite hobby <sup>137</sup>

June 28, 1919 : WWI "officially ends" as lasting Peace is Declared. (Cooling off period until ?)

The Peace Treaty is signed in Versailles; it prohibited Germany to have an air force or produce military aircraft.

---

<sup>137</sup> Flight 05 June 1919 pg 726

## Notes on "Civil Aviation"

7 July 1919 : GOVERNMENT HOUSE , OTTAWA.

PRESENT: HIS EXCELLENCY THE GOVERNOR GENERAL IN COUNCIL.

HIS Excellency the Governor General in Council, pursuant to the provisions of the "Air Board Act" is pleased to approve the following regulations, prepared and recommended by the Air Board, and the same are hereby approved and established accordingly :

### Regulations.

1. No aircraft shall fly over any city or town except at such altitude as will enable the aircraft to land outside the city or town should the means of propulsion fail through mechanical breakdown or other cause ; provided that this prohibition shall not apply to any flight undertaken for a special purpose approved by the Air Board, or any area comprised within a circle with a radius of one mile from the centre of an aerodrome approved by or under the control of the Air Board.
2. No person in any aircraft shall—
  1. (a) carry out any trick flying or exhibition flying over any city or town area or populous district ; or
  2. (b) carry out any trick flying or exhibition flying over any regatta, race meeting, or meeting for public games or sports, except where specially arranged for in writing by the promoters of such regatta or meeting ; or
  3. (c) carry out any flying which, by reason of low altitude or proximity to persons or dwellings, is dangerous to public safety ; or
  4. (d) drop or cause or permit to be dropped from the aircraft any article capable of causing injury or damage.
3. Where any aircraft flies in contravention of any provision of these regulations, the owner of the aircraft, and also the pilot or commander shall be deemed to have contravened the regulations ; provided that it shall be a good defence to any proceedings for contravention of these regulations if the contravention is proved to have been due to stress of weather or other unavoidable cause, or to have been approved by the Air Board.
4. Any person contravention any provision of these regulations *shall be liable to imprisonment for a term not exceeding six months or to a fine not exceeding one thousand dollars, or to both* such imprisonment and fine.

These regulations to come into force on the 1st day of August, 1919.

RODOLPHE BOUDREAU, 3-1 Clerk of the Privy Council.

25 August 1919 : The Aircraft Transport and Travel company made aviation history by starting a regular passenger and freight service between London (Hounslow) and Paris (Le Bourget).

25 August 1919 : Toronto to New York Air Race : During the Canadian National Exhibition at Toronto, an air race is held. Toronto to New York. The Aero-Club of Canada issues a special \$1 commemorative stamp which is used to help fund the race by the carriage of Air-Mail between the 2 cities.

25 to 28 August 1919 : representatives of five [private] air transport companies from Denmark, Germany, Great Britain, Norway and Sweden meet at The Hague, Netherlands (KLM) and sign an agreement to form "the *International Air Traffic Association*" (IATA).

01 September 1919 : Ottawa Canada - The Dominion Parliament <sup>138</sup> assembled for the Third Session of the Thirteenth Parliament and was prorogued on the 10th November, 1919.

02 September, 1919 : PEACE TREATY RESOLUTION. 'the Prime Minister moved the following resolution in the House of Commons : - " That it is expedient that Parliament do approve of the Treaty of Peace between the Allied and Associated Powers and Germany . . . which was signed on behalf of His Majesty, acting for Canada, by the plenipotentiaries therein named, and that this House do approve of the same."'. The Prime Minister (the Right Hon. Sir Robert Borden) said that they were assembled to consider the terms of Peace which were presented to Germany after many anxious months of study and debate. Including the British Dominions, who were given in the Peace Conference a place commensurate with the part they had taken in the war, there were thirty two nations assembled in the secret Plenary Session on the

---

<sup>138</sup> Journal of the Parliaments of the Empire Vol. I.-No. 1. January, 1920. pg 87-

6th of May at which those terms were unanimously adopted. He did not claim that there was no hesitation or even that there was no protest. Probably not a single nation and he did not except Canada from the assertion was absolutely satisfied with every disposition contained in the Treaty. But there was the great outstanding fact that thirty-two nations of varying and sometimes conflicting ideals and aspirations did finally give their undivided assent to a treaty which whatever its imperfections might be, was designed in all sincerity to assure the future peace of the world. It was unquestionable that the Treaty should be submitted to Parliament for its approval before ratification on behalf of Canada took place. The formal ratification was in the name of the Sovereign ; but in giving that ratification on behalf of Canada, His Majesty necessarily acted at the instance of his constitutional advisors in that country.

The League of Nations.

After alluding to the necessarily severe character of the Treaty, the Prime Minister proceeded to describe its terms. He observed that to deprive Germany of her entire Colonial Empire was a stern though just measure. Referring to the League of Nations, "a covenant founded upon the solemn and unanimous affirmation of thirty-two of the world's nations that not force, but right and justice shall be the arbiter of international disputes," he stated that the Canadian delegates took exception to certain of its original provisions, and that their views were set forth in a confidential memorandum. Many of their objections were met in the revised draft, and as to the others, they felt that important as they regarded them, they ought not to be accounted of moment in comparison with the supreme purpose embodied in the Covenant.

Representation at Peace Conference.

After paying a tribute to the absolute co-operation and understanding with which the representatives of Great Britain and the Dominions had worked, the Prime Minister considered the character of the representation secured by Canada at the Conference, her position as a signatory of the Treaties concluded there, and her status as a member of the League of Nations and of the International Labour Convention. He stated that the sessions of the Imperial War Cabinet held in the spring of 1917 and in the summer of 1918, afforded in a certain measure the means of carrying out of this understanding (concerning the terms of peace). After the Armistice, his proposal was adopted first by the Imperial War Cabinet, and, after considerable discussion, by the Conference, that there should be a distinctive representation for each Dominion, similar to that accorded to the smaller allied powers, and in addition that the British Empire representation of five delegates should be selected from day to day from a panel made up of representatives of the United Kingdom and the Dominions. The adoption of the panel system gave to the Dominions a peculiarly effective position. At plenary sessions there were sometimes three Canadian plenipotentiary delegates, two as representatives of Canada and one as representative of the Empire. Dominion Ministers were nominated to and acted for the British Empire on the principal Allied Commissions

## Notes on "Civil Aviation"

appointed by the Conference to consider special aspects of the conditions of peace. He had himself been called upon to put forward the British Empire case in respect of the Clauses on economic questions, International control of Ports, Waterways and Railways, and on Submarine Cables. During the last month in Paris, he had acted regularly as Chairman of the British Empire Delegation in the absence of Mr. Lloyd George.

Constitutional Status.

(1) At the Conference. Finally, it was desirable to note an important development in the constitutional practice respecting the signature of the various Treaties concluded at the Conference. Hitherto, it had been a practice to insert an article or reservation providing for the adhesion of the Dominions. Now his (the Prime Minister's) proposal had been adopted that the assent of the King as High Contracting Party to the Treaties should, in respect of the Dominions, be signified by the signature of the Dominion plenipotentiaries, and that the preamble and other formal parts of the Treaties should be drafted accordingly. This important constitutional development involved the issuance by the King of full powers to the various Dominion plenipotentiary delegates, and in order that such powers issued to the Canadian plenipotentiaries might be based upon formal action of the Canadian Government, an Order in Council was passed on April 10th, 1919, granting the necessary authority. This new and definite status of the Dominions was further manifested in the constitution of the League of Nations as well as the International Labour Organisation.

(2) In the Empire. "The future relationship of the Empire," said the Prime Minister, "must be determined in accordance with the will of the Mother Country and of each Dominion in a constitutional conference to be summoned in the not distant future. Undoubtedly it will be based upon equality of nationhood. Each nation must preserve unimpaired its absolute autonomy, but it must likewise have its voice as to those external relations which involve the issue of peace or of war. So that the Britannic Commonwealth is in itself a community or league of nations which may serve as an exemplar to that world-wide League of Nations which was founded in Paris on the 28th of last June. . . . The same indomitable spirit which made Canada capable of that effort and sacrifice (during war) made her equally incapable of accepting at the Peace Conference, in the League of Nations, or elsewhere, a status inferior to that accorded to nations less advanced in their development, less amply endowed in wealth, resources and population, no more complete in their sovereignty and far less conspicuous in their sacrifice. In answer to a question of the Hon. W. S. Fielding as to what difference it would make if the Canadian Parliament failed to ratify the Treaty, the Prime Minister said that in that case Canada would stand out of and apart from the rest of the Empire and would be committed to such independent action that she could not be regarded as acting in co-operation with the other nations of the Empire. He added that the British Government were not disposed to deal with the Treaty, so far as Canada was concerned, apart from the approval of the Canadian Parliament.

## Notes on "Civil Aviation"

The League of Nations.

Article VIII. of the League involved the maintenance by Canada of a standing army. Article X. might involve her entry

PEACE TREATY RESOLUTION. 91

entry into any petty quarrel between small nations, while constitutionally Canada was only bound by what she agreed to do by virtue of the machinery provided by and for the British Empire of which she was a component part.

In Article XVI. they said that they would refuse to have any intercourse with any member of the League that went to war without the consent of the whole League. Their plenipotentiaries undertook to say that Canada had signed the Covenant apart from Great Britain, and Canada might possibly put herself in the position of being in arms against the Mother Country.

Ratification.

Turning to the question of ratification, Mr. McKenzie said that this was unnecessary in so far as it concerned the Canadian Parliament. Ratification, in the words of Mr. Lloyd George, was for the Crown; and the Treaty, having been signed by the King, was already absolutely obligatory. The plenipotentiaries had received their commissions from the King, and they signed the Treaty as his direct representatives.

The Minister of Public Works (Hon. A. L. Sifton) said that this was the first time within the confines of the British Empire in which any Parliament had been asked to approve a Treaty. The Treaty had not yet been ratified. When it was, it would be ratified by the King of England on behalf of the United Kingdom on the advice of its Government, and on behalf of Canada by the King of the British Empire upon the advice of the Government of Canada. This was in accordance with the promise made in Parliament by the Prime Minister that before ratifying the Treaty he would submit it to Parliament. There was no question in the motion of ratifying the Treaty. It was a motion to approve as a whole or disapprove of the Treaty. Here was an example of the most radical change in the constitution of this portion of the Empire in the submission to Parliament of the Treaty which the Government, under the British Constitution, might have ratified by an Order in Council. The powers given by the King to the plenipotentiaries were not powers to act for the British Empire as a whole, but to sign treaties for the Dominion of Canada.

The Hon. Dr. Henri S. Beland\* (Liberal, Beauce, Que.) [Dr. Beland, who was Postmaster-General in Sir Wilfrid Laurier's Administration, was taken prisoner in Belgium early in the war and remained a civilian prisoner in Germany during a great part of the war.] was of the conviction that no consequence of any importance

to Canada, nationally or internationally, would result from their abstention (from approving the Treaty) any more than if India's approval failed to be given. He was afraid that Canada was gradually assuming more and more international obligations without any corresponding international status. A fever of Imperialism, the main symptom of which was a blind desire to centralise in London the administration of Canadian

## Notes on "Civil Aviation"

affairs, was haunting the minds of some of their public men. In the interest of the solidarity and the permanence of the Empire it was the duty of the Canadian Parliament to resist that tendency. Not being a sovereign state, Canada could well have left it to the representatives of Great Britain to enter the League of Nations. In such an event, ipso facto Canada, as an integral part of the Empire, would have been a member of the League and would have shared in its benefits without being exposed to most difficult and dangerous situations politically and militarily. He believed that England herself would rather not have Canada join the League. Great Britain was satisfied that whenever her interests or those of the Empire were threatened she could count on the generous co-operation of her leading Dominion Canada.

Canada Contracted into the League.

It was quite proper and he was glad that Canada should be invited to the Peace Conference, but the Treaty was made between the British Empire and the other Powers, and whether they approved it or not, it bound the whole of the British Empire including the Dominion of Canada. The Prime Minister described their membership in the League of Nations as a further manifestation of their new status, but they were made members of the League by no act of their own but by the high contracting parties, of which Canada was not one except as part of the Empire. They were contracted into the League. If the opinion of President Wilson, given to a Committee of the United States Senate, was correct, they were not enjoying

a full and separate membership in the League ; they were a mere addition to the voting power of the British Empire when questions in which the Empire had no concern were discussed and decided upon. If that opinion was erroneous, and they were considered a separate entity in the League, then the consequence of Article XVI. would be that they would have to redeem their obligations and side with other members of the League against Great Britain, and thereby cease to remain in the Empire, or else they would have to disregard their pledges and take sides with Great Britain.

## Notes on "Civil Aviation"

Canada without International Status.

US President Wilson had said that if trouble should arise between England and the United States, there would be no trouble with Canada because Canada had no diplomatic relations with the United States and therefore Canada had no international status. How could they be a nation in the true sense of the word if they had no international status? He asked whether the Minister of Justice could contend that Canada was an independent nation when Canada had not a word to say when war was declared and had not a word to say as to the conditions of peace? Another essential condition to the change in their status was to take away from the Mother Country the right to amend their constitution. He hoped that the Minister of Justice would insist upon the abolition of appeal to the Privy Council.

Amendment Moved,

The ratification of the Treaty would bind Canada, but it would bind her subject to the terms of the Canadian constitution. They were going to lose the power of Parliament in determining what part they would take in war if the Treaty was ratified without any reservation whatever. The Prime Minister had said that in anything that might be done with regard to their status the autonomy of Canada was going to be preserved at all costs. He therefore was going to ask his hon. friends opposite to join him in protecting the autonomy of Canada by an amendment, that the following words should be added to the resolution: "That in giving such approval this House in no way assents to any impairment of the existing autonomous authority of the Dominion, but declares that the question of what part, if any, the forces of Canada shall take in any war, actual or threatened, is one to be determined at all times as occasion may require by the people of Canada through their representatives in Canada."

"Nationhood

was a matter of fact; it was not a question of what was written in a statute book or what was endorsed by one nation in relation to another. When His Majesty the King came to act and the signature of the British Empire had to be attached to the Treaty, to provide the signature of the British Empire there were required the signatures of those statesmen specially representative of the United Kingdom and of the Crown Colonies and dependencies plus the signature of Canada, plus the signature of Australia, plus the signature of New Zealand, not because they pretended to be nations separate from the British Empire but because they were the nations that composed the British Empire."

*the British Empire, apart from the Crown Colonies and so forth, consisted of some five self-governing nations.*

"The United Kingdom," he said "is not in itself the British Empire; it takes all these nations to make up the Empire. And when the British Empire makes a Treaty it is fitting that the whole of the Empire should join in making it"

JOURNAL OF THE ENGINEERING INSTITUTE OF CANADA Engineering Index

This Index is prepared by the American Society of Mechanical Engineers. : AERONAUTICS Canada. Canada's Plan for Control and Development of Aeronautics, Allen Sinsheimer. Automotive Industries, vol. 41, no. 15, Oct. 9, 1919, pp. 701-703.

## Notes on "Civil Aviation"

Original draft of recently established Air Board for control of aeronautics.

07 October 1919 : foundation of the *International Air Traffic Association* with its Central Office at The Hague.

IATA's expressed aim is the establishment of unity in the operation of air routes of affiliated organizations whose systems were of international importance.

The *International Air Traffic Association* was limited to the original European signatories until 1939, when Pan American Airways joined.

October 13, 1919 : A Convention was signed in Paris for the purpose of applying certain rules about international air navigation.

In Britain the Air Navigation Act, 1920 was subsequently passed - to enable British enterprise into the French Convention. Among other details of the Act, provision was made for the Licensing, inspection and regulation of aerodromes. Also access to aircraft factories for the purpose of inspecting work in progress was another important part of the Act.

In October 1919, with the choice of types close to being finalized, the Canadian Air Board requested more single-engined float planes, or types easily converted to that configuration, for "forest and survey experiments."

Royal Air Force surpluses did not include such machines, so none were forthcoming.

The aircraft offer had surprised the Air Board. It was just beginning to organize itself, **and had no technical staff to advise on the selection of machines. Canadian aerial veterans joining the Air Board brought their knowledge of different aircraft types, and a lack of expertise was superseded by a cacophony of conflicting opinions.**

One voice quickly became dominant and it belonged to Lieutenant-Colonel Robert Leckie who had taken up the appointment of director of flying operations. Amid exchanges of telegrams between Canada and Britain, packing of the aircraft proceeded apace at Shoreham. Major Donald MacLaren initially supervised the work. On his return to Canada in November 1919 he was succeeded by Maj. James A. Glen. Shipping began in December 1919 and continued until May 1921.

Initial uncertainty about the compatibility of imperial and Canadian objectives held up the first consignment by at least one month; further delays arose from the inadvisability of dispatching aircraft as deck cargo during winter.

Thus, the bulk of the Imperial Gift did not leave Britain until the summer of 1920. Apart from the aircraft, the gift included engines, cameras, at least 31 prefabricated hangars, seaplane beaching gear and motor transport.

Most of this eventually reached Camp Borden in Ontario, where it was stored, assembled or forwarded elsewhere under the supervision of Captain George O. Johnson who had formerly been engaged in the assembly and exhibition of German aircraft shipped to Canada as war trophies.

15 January 1920 : The first "Gift" airplanes arrive in Canada.

There was a shortage of trained aircraft mechanics to assemble them. Once deliveries increased, a work routine evolved. Uncrated aircraft were checked scrupulously while being assembled. Rubber connections were replaced, registration markings painted on wings and fuselages, and the paperwork of formal registration completed.

Each machine was test flown for at least one hour. Once deemed fit, it was either assigned to the "CAF at Camp Borden" or dismantled and packed for rail shipment to an "Air Board flying station".

After many suggestions and changes, the final mix of aircraft consisted of the following types:

### Lighter-than-Air-Craft

I. Non-Rigid Airships (SSZ and ZSSC class airships) : 6, possibly 9 total

A. airships unpacked, assembled and inflated : 1 - as a test,

II. Kite Balloons : 30

III. Lighter-than-Air-Craft spares and accessories:

A. "airship cars" : 17

B. "silicol plants" (used to manufacture hydrogen) : 6

IV. Lighter-than-Air-Craft "Ground Handling Equipment":

A. compressors,

B. winches

## Notes on "Civil Aviation"

- C. special trucks : 4
- V. Heavier-Than-Air-Craft
  - A. Royal Aircraft Factory B.e.2C : 2
  - B. Curtiss H-16 flying boat : 2
  - C. Bristol F-2b fighter : 2
  - D. Sopwith Snipe : 2
  - E. Fairey Mk3-C Seaplane : 1 (assembled by Canadian Vickers in Montreal)
  - F. Royal Aircraft Factory Fe.2D : 1
  - G. Vickers F.B.9 : 1, along with some "replacement airframes",
  - H. Avro 504 : 62
  - I. de Havilland DH-4 : 10 (11?)
  - J. de Havilland DH-9 : 12 (13?)
  - K. Royal Aircraft Factory Se5a : 12
  - L. Felixstowe F-3 flying boat : 8
    - 1. One F-3 was assembled, registered, but not given a certificate of airworthiness and never flown.
    - 2. At least one F.3 assembled by Canadian Vickers in Montreal.
    - 3. Two "crated" F.3s were shipped directly to Vancouver for assembly.
    - 4. Crated F.3's were sent to Victoria Beach, Manitoba.
    - 5. Crated F.3's were sent to Dartmouth, Nova Scotia.

Not all Imperial Gift aircraft were immediately assembled.  
At least nine Imperial Gift aircraft never left their crates.  
bringing the total to 120 Imperial Gift aircraft.

Canadian officials had been excited at the prospect of acquiring lighter-than-air material, of which there was a considerable surplus, for topographical surveys.

Air board members, prepared to take almost anything the British had to offer, underestimated the adaptability of airplanes and overestimated that of airships.

The Air Board also borrowed airship specialist Flight-Lieutenant John A. Barron from Britain.  
Flight-Lieutenant Barron was one of the few Canadians who had acquired airship experience. As it turned out, there was almost nothing for him to do. Although one airship was unpacked, assembled and inflated as a test, almost all the lighter-than-air material remained crated.

Flight-Lieutenant John A. Barron transferred from the Air Board's Flying Operations Branch to the Technical Services Branch, where he assumed the title of assistant director of technical services.  
Flight-Lieutenant John A. Barron was thus available to any party that might need airship advice.

One firm, the Keewatin Lumber Company, proposed using airships in its operations, but advanced no concrete plans.

March 1920 : only 3,280 officers and 25,000 other ranks remain in the RAF. More than 23,000 officers, 21,000 cadets (potential pilots) and 227,000 other ranks had been demobilized. Vast quantities of surplus equipment, aerodromes and landing grounds had been returned to their original owners or sold off at rock-bottom prices.

March 1920 : The Women's RAF, created on 1 April 1918 is completely disbanded

March 1922 : Flight-Lieutenant John A. Barron was "let go" from the Air Board.

Balloon and airship envelope material served as roofing repair material at Camp Borden and Ottawa.

6 February 1923 : Air Board issues disposal instructions for lighter-than-air material, "an enormous stock of junk".  
1925 : National Defence Headquarters orders the destruction of "whatever lighter-than-air material remains".

07 October 1920 : several Imperial Gift aircraft in the public spotlight as participants in the Trans-Canada Flight.  
The event was not a continuous expedition but a series of hops by different crews using different aircraft.

## Notes on “Civil Aviation”

07 October 1920 : the sole Fairey 3C crashes en route from Halifax to Saint John, fortunately without injury to the pilot, Lt.-Col. Leckie.

Lt.-Col. Leckie. returns to Halifax and switches to a Curtiss HS2L flying boat.

08 October 1920 : Lt.-Col. Leckie and Curtiss HS2L reach Rivière-du-Loup, Que. Felixstowe F3 substituted for Curtiss HS2L

11 October 1920 : 14 stops (made where?) later, Lt.-Col. Leckie and F-3 arrive at Winnipeg. DH.9 substituted for the Felixstowe F.3

17 October 1920 : Lt.-Col. Leckie and DH.9 arrive at Vancouver after mechanical and weather delays, an adventurous flight through the Rockies and 11 landings (made where?).

The Imperial Gift machines figured in other significant Air Board operations.

Autumn 1920 : 1 Avro 504K and 1 Bristol F.2b, flying from the Rockcliffe Rifle Ranges near Ottawa, experiment in adapting wartime photographic reconnaissance methods to aerial mapping.

The Avro proved unsuitable (low ceiling, vibration) and the Bristol was too sensitive at the controls to be good photographic aircraft but the concept was considered sound, provided better machines could be employed; the DH.4 and DH.9 were considered best candidates.

Many of the types were employed in “double duty” functions.

The Avro 504Ks at Camp Borden shuttled between training work and participation in militia exercises throughout Ontario. Similarly, the de Havilland aircraft based at High River, Alta., were switched between forestry, photography and militia training tasks. Some of the militia work consisted merely of taking up officers to familiarize them with the appearance of a mock battlefield. **Canadian authorities occasionally tinkered with the aircraft.**

The DH.4s, as received, were judged “difficult” machines, and several were converted to the American DH.4B standard, moving the fuel tank from a point between the two cockpits to immediately in front of the pilot’s cockpit. This placed the tank nearer the aircraft’s centre of gravity, and thus ensured greater stability as fuel was consumed (the standard DH.4 tended to become nose-heavy during flight).

No amount of modifications could make the open-cockpit DH.4s comfortable in winter; official issue clothing (designed for wartime France) was often inadequate. Flying boots were sometimes discarded in favour of locally produced moccasins. Some of the aircraft types proved disappointing under Canadian conditions.

The Felixstowe F3 flying boats were cumbersome in all but the most spacious lakes. Their size also complicated the standard method of moving aircraft long distances—disassembly, transport by rail, re-assembly at the intended operating base. Felixstowe F3 flying boats were costly to operate, and because the various F3s had been built by different contractors, they differed in detail one from another, complicating maintenance.

Felixstowe F3 flying boats in Manitoba were constantly being damaged in shallow lakes with consequent operational delays.

On Sept. 29, 1922, the superintendent at Victoria Beach Air Station was advised to scrap his Felixstowe F3 flying boats, sending spare parts on hand to Vancouver while salvaged instruments and engines were to be shipped to Ottawa.

An F3 accident near Vancouver on July 24, 1921 underlined a surprising problem.

None of the five occupants were injured, but the court of inquiry blamed the pilot for alighting too quickly.

The most striking observations came from Col. Robert Leckie.

Col. Leckie concluded that Canada in general—and the Pacific coast in particular—had a shortage of “experienced seaplane pilots.” Leckie noted that “it is now necessary to select good aeroplane pilots and train them in seaplane work.”

Although Canada had emerged from WW I with a large body of flying talent, it was not immediately balanced to meet national needs—too many landplane veterans as opposed to the floatplane and flying boat experts most urgently needed (and who knows, maybe too many ex-fighter jocks?)

The defects of the Felixstowe F3 flying boats became more obvious when compared with another type of aircraft.

Independently of the Imperial Gift, the Air Board had acquired 12 HS2L single-engined flying boats that had been flown by the United States Navy.

Although lacking the load capacity of an F3, they were reliable and adaptable to operating from confined spaces. The Felixstowe F3 flying boat needed 56 inches of water for safe launching, compared to 34 inches for an HS2L.

## Notes on "Civil Aviation"

The aircraft were flown in relatively primitive conditions.

Land bases were improvised from whatever flat terrain was available, accessible to the operations site and reasonably free of obstructions such as trees or windmills.

That still left hazards such as hillocks, gopher holes and sandy soft spots.

Even Camp Borden, a training base since 1917, was not immune.

Typical of the accidents resulting was that of a DH.9a that ran into a sand hole at Camp Borden on Jan. 12, 1921. The pilot was unhurt, but the aircraft had to be rebuilt.

By the summer of 1927 the continued reconditioning of DH.9a machines was deemed uneconomical and the five surviving aircraft were reduced to spares. By then, little beyond wire rigging could be recycled into current equipment.

Although relatively new when acquired, the Imperial Gift machines deteriorated quickly in Canadian climates marked by extremes in temperature and humidity plus frequent sharp fluctuations of both.

At the conclusion of the 1921 flying season, the DH.4s at High River were stripped down and examined. The commanding officer reported wooden components being warped and distorted; they needed rebuilding or replacement.

The non-durability of Imperial Gift aircraft in Canada contrasted with RAF experiences.

The RAF kept many of its WW I designs operational for years.

RAF DH.9s remained in British-based service until September 1930.

In the Middle East, RAF DH.9s continued as combat aircraft until May 1930.

Newer types of aircraft (Vickers Vikings) were appearing as early as 1923.

1926 Avro 504K receives a new lease on life, re-engined with Lynx radials and designated Avro 504N. (The longest serving Imperial Gift type was the 504)

1928 : DH.60 Moth service introduction. Beginning of the end of the Avro 504 types.

Aircraft seriously damaged in crashes were usually written off;

ageing machines were frequently converted to "instructional airframes" used by trainee mechanics much as medical students practised on cadavers.

Even the "instructional airframes" outlived their usefulness.

1932 : officers note that four years after being torn down and rebuilt, a scrapped Avro 504 was "in such a state that it has become necessary to employ methods that are distinctly misleading and thoroughly inadvisable."

November 1934 : The last of the "Imperial Gift" aircraft, an Avro 504K, was written off in having spent six years as an instructional airframe.

If the aircraft had lived finite lives, some equipment had been more durable.

A gantry crane delivered in 1920 was still in service at Camp Borden in 1938.

Initially used to assemble Imperial Gift aircraft, the gantry crane was used in erecting aircraft for re-arming Canada in WWII.

1919 : First air transport organization in Belgium - the Syndicat National pour l'Étude des Transports Aériens (SNETA) is formed and acts as the Belgian national flag carrier until May 1923.

DeMob and RESETTLEMENT .

THERE are many officers and men of the R.A.F., who are demobilised or are about to be demobilised.

In order to assist those who are undecided or are seeking advice as to their prospects in civil life, the Editor has arranged for an expert, with wide experience of service, industrial and educational conditions, to give advice to those who may solicit it through the medium of this Journal.

## Notes on "Civil Aviation"

Applications, which must be in writing, should be marked Resettlement, and addressed to the Editor, FLIGHT, 36, Great Queen Street, Kingsway, W.C. 2. They will be dealt with in these columns, as far as possible, in rotation.

There are two main types of employment in civilian aviation :

- (1) Technical; considerable practical and theoretical training is required such as a diploma or degree in mechanical engineering at some recognised college or university, and some practical workshop experience
- (2) Piloting : a certain amount of technical training is required in addition to flying experience.

AMBITIOUS, R.N.A.S. It is fairly clear that as comparatively few personnel will be required in the immediate future for commercial aviation

only those possessing the highest qualifications will, in the ordinary course of events, succeed in obtaining employment in civilian aviation. We think that unless you are prepared to take a course of mechanical or aeronautical engineering of at least two years duration you will be best advised to seek employment based on your pre-War training.

H.S.W.S., EX-OFFICER, R.A.F.—There are certainly as good prospects for draughtsmen in aeronautical engineering as in any other branch of engineering. With regard to a better position later on, this will depend on the efforts you make to acquire the necessary experience for design. In aeronautical engineering (design) a sound knowledge of mathematics is essential in order to study the results of research and to apply the knowledge gained to practice. We regret you are not satisfied with your present position, but in view of the present labour market you should be very cautious.

### R.A.F. Officers (Technical - Pay) 1919

---

Lieut.-Col. Sir F. HALL asks the Under-Secretary of State to the Air Ministry (Maj.-Genl. Seely):

1. whether any decision has yet been arrived at as to awarding technical pay to officers in Category "B" of the Royal Air Force
2. whether the duties of officers in Category "B" are of less importance than those of the officers in Category "A" ; and
3. whether, when a decision is arrived at, in the event of it not already having been reached, emoluments will be made retrospective to temporary officers as and from the date of the Air Ministry Order of September 26, 1918 ?

Maj.-Genl. Seely : This matter has been very carefully considered, and:

1. it has been decided not to award technical pay generally to officers in category "B", as
2. their duties do not involve the same standard of technical knowledge as those of officers in category "A".

08 January 1919 : (Source : The Aeroplane - ON THE R.N.A.S. IN 1918 by C.G. Grey)

There were four categories of work for members of the WRAF:

A – Clerks and typists;

B – Household such as cooks, waitresses and domestic workers;

C – Technical such as tinsmiths, photographers, metal workers, wireless operators and carpenters; and

D – Non-Technical or General, which included tailoresses, shoemakers and motor cyclists.

The majority of the work was for clerks and typists.

The household workers endured the toughest work and the longest hours.

The technical section offered the greatest range of employment and was one of the few sectors during the war where women were trained for skilled positions.

The WRAF was nicknamed the 'Penguins,' because, like the birds, they did not fly.

the Navy is determined to have its own Air Service again.

If the sea-going people of the R.A.F. do go back to the Navy, they will probably not be called the R.N.A.S., for their officials at the Admiralty would scarcely lose the opportunity of making the personnel buy new uniforms and thus of putting more money into the pockets of their friends the Naval outfitters.

The chances are that they will merely come in as Naval officers:

Lieut. (A.) and Lieut. (O.), for aviator and observer, and

Lieut. (A.E.) for aircraft engineer, or something on those lines, and

## Notes on "Civil Aviation"

the air mechanics will become aircraft ratings analogous to torpedo or engine-room or stoker ratings. All of which would be as it Image : Fairey "Campania" RNAAeroplane 08 Jan 1919.

should be, and as was advised in this paper long enough before the war. those holding PCs to be the senior and Air officers of the future. He envisaged the course as giving

In a paragraph of the Memorandum entitled "Extreme importance of training" Trenchard outlines his vision for the training of officers and airmen. "a thorough grounding in the practical and theoretical aspects" of being an Air Force officer *"and in addition" the cadets would learn to fly.*

The words "in addition" are highly significant. Trenchard saw the cadets as becoming "officers" first and foremost and pilots second.

The fact that they had to learn to fly as well was a peculiarity of the RAF. He intended that the RAFC would equip them with the knowledge to undertake the usual tasks and duties of an officer in a similar vein to those in the Army or RN.

This involved the leadership of men. This knowledge would be developed during their career so that they would be to fit organize and operate a Service which coincidentally happened to fly aircraft in its fighting role.

Formerly when an R.N.A.S. officer went aboard a ship or entered a Naval mess ashore he was treated with the same cold courtesy which is extended to a not particularly popular civilian.

He was never one of themselves.

In these days an R.A.F. officer in correct uniform under the same circumstances is treated with the same cold courtesy, unless the removal of an overcoat displays a D.v.S.C. ribbon, or a casual remark reveals that he was once R.N.A.S., in which event the Navy promptly falls on his neck and welcomes him as a long-lost brother, and he is lucky? - if he gets out of the ward-room while still sober.

Pilots writing into the "Aeroplane" magazine :

the risks which the active-service people were, and are, ready to take in the King's Service, despite being let down time after time by brainless chiefs or intriguing officials at home.

the "brains" of the technical departments did not think much of seaplanes with high performances, and spent their time playing with other things. Not knowing much about the war they were full of theories, and nothing much else.

### THE FREEDOM OF CIVILIAN FLYING.

On January 8th Major-General Sir Frederick Sykes, K.C.B., C.M.G., D.S.O., Chief of the Air Staff, R.A.F., (one of the earliest Royal Flying Corps officers. He was Commandant of the Military Wing, R.F.C., when that Corps was first formed, and held that post until the outbreak

of war, when he went to France with the historic first five squadrons. Thereafter he commanded all R.N.A.S. units in the Eastern Mediterranean, and subsequently severed his connection with flying altogether in order to take up an appointment at the War Office. On the resignation of Major-General Sir Hugh Trenchard, General Sykes was appointed Chief of the Air Staff, which post he has held ever since.) Sykes - Chief of the Air Staff, read a most interesting paper on the developments of aerofautics to the London Chamber of Commerce at the Cannon Street Hotel January 8<sup>th</sup> 1919. As this paper was going to press at the time, it has been impossible to report the lecture, but it is hoped that it will appear in extenso next week. It is necessary, however, to give all possible publicity to General Sykes' official statement that a new code of regulations for civilian flying is now being drawn up, and will be presented to Parliament when the House assembles. It is hoped by those responsible for them that these regulations will come into force within a very few weeks of their presentation and that civilians will soon be free to fly again without military restrictions. The regulations will be published shortly.

General Sykes is essentially a soldier, and has been a close friend of General Sir Henry Wilson, Chief of the Imperial General Staff, and therefore if it comes to pass, as is rumoured, that the military side of the Royal Air Force goes back under the control of the War Office, there is no doubt that the fact of his holding the post of Chief of the Air Staff will make for smooth working with the Army Chiefs.

Major-General Sir John Maitland Salmond, K.C.B., C.M.G., C.V.O., D.S.O., G.O.C. R.A.F. with the Army in France during the whole of 1918, is an outstanding example of the triumph of the regimental officer. One believes that it is correct to say that until his appointment as Brigadier-General Commanding a Brigade of the R.F.C. under General Trenchard, General Salmond had never held a Staff appointment.

He learned to fly at his own expense at Hendon in 1912, and he joined the R.F.C. as a Captain of Infantry, being then an officer of the King's Own (Royal Lancaster) Regiment. His promotion, though rapid, followed orthodox lines, and at the outbreak of war he took the famous No. 3 Squadron from Netheravon to France as a Major. In 1917, when he commanded a Brigade in France, he was sent to England to command the Training Brigade, which later became the Training Division, with promotion of its G.O.C. to Major-General. In that position he laid down that whole "scheme" (Programme) of training for the R.F.C. which has proved of such excellence that it has enabled the R.A.F. pilots during 1918 to hold the command of the air

— which they won in 1917—despite the fact that, with hardly an exception, they were still mounted on machines which were in use in 1917. The system of training instituted during 1917 has been one of the most brilliant successes of the War, and though the general mis-organisation of the R.A.F. during 1918 has unfortunately done much harm

## Notes on "Civil Aviation"

to its efficiency, the system itself can still be revived under improved organisation at any future date. General Salmond's name deserves to be famous in history not merely for his brilliant handling of the R.A.F. in France during 1918 and for the excellence of his Staff work, and for the wonderful confidence which he has the genius for instilling in all those who serve under him, but for the fact that the training system which he inaugurated at home laid the foundation for his own success in the Field.—C. G. G.

### Aeroplane - Jan 08 1919 - THE INFLUENCE OF OFFICIAL CONTROL UPON THE DESIGN OF AIRCRAFT, 1914-1918 By "STRASBOURG."

It is fairly obvious that the time has not yet arrived when a history of the activities of the various technical branches attached to the permutations and combinations of H.M. Naval and Military Air Services can be compiled in any detail, nor is it yet possible to give in any semblance of their true perspective an account of their actions and reactions in regard to specific matters. The sum of the effects which have been produced under the impelling stress of war in the design of aircraft, to consider if those effects show the development of the art to have made progress commensurate with the energy which has been expended thereon during that period.

It must be acknowledged that, on the score of reliability and performance, the aeroplane has progressed probably as far as any but the uninformed would have cared to prophesy three years ago, a close examination of the aircraft of to-day<sup>7</sup> reveals the fact that very little has been achieved to-day that could not have been achieved in 1914, had motors of the same power, weight, reliability, and economy then been available.

#### Relative Performances.

For, when the matter is explored, the differences between the performances of to-day and the performances of July, 1914, resolve themselves almost entirely into the difference between that of a machine carrying 7<sup>7</sup> lbs. per h.p. and one carrying 17 lbs. per h.p., and that the 17 lbs. per h.p. machine of to-day is very little superior to the best designs of approximately similar loading of 1914.

To this it will be at once objected that, owing to the refinement of design, the 17 lbs. per h.p. machine of to-day carries a much larger proportion of its total weight in the form of useful load, and that this is the measure of the actual advance. This view is just, but in assessing the extent of the technical progress which is indicated by this improvement, due allowance must be made for the extent to which it has been made possible by the improvements in motors owing to the possibility<sup>7</sup> of obtaining materials and accessories which were prohibited by their cost to those who attempted to build aircraft in pre-war times.

The structural design of aircraft has undoubtedly improved generally; reasonably accurate methods of estimating the loads and stresses to which the structure may be subjected have become more widely known, and a more economical use of material has thereby become general.

For this dissemination of knowledge the official controllers of aircraft design may claim some credit. Further improvements in the general average of structural design have resulted from the influx to the Industry, under the compulsion of war conditions, of a considerable number of engineers and engineering draughtsmen possessing experience of structural design in other branches of engineering.

#### An Unaltered Structure.

But in spite of these improvements—refinements is possibly a more correct term—the aeroplane structure of to-day is the aeroplane structure of 1913-14 in all essentials, and there is nothing to show that, given the same plant and materials as are now available, the best designers of 1914 would have fallen appreciably behind the present-day standard of structural design.

There remains only to consider the aerodynamic features of the aeroplane of to-day. Have they improved

appreciably ?

The most cursory examination of the aircraft at the beginning and the end of the war will suffice to show that no startling innovation in regard to the general disposition of surfaces has occurred.

Probably the most noticeable change in this respect is the nearly universal use now of a fixed vertical fin in front of the rudder, a feature frequently absent in prewar machines.

It requires a very minute search to discover grounds for supposing that any machine in general use to-day has been more completely faired in its lines with a view to the avoidance of unnecessary air resistance than, say, the two-seater Avro of 1914 or the Sopwith "Tabloid." There has been a levelling-up of the average machine to something considerably nearer the best in this respect, but fairly general use of "streamline" wires on highspeed machines is the nearest approach to a revolutionary change.

Aerofoil Design.

Has there, then, been any very great improvement in the form and efficiency of the supporting surfaces employed on the modern machine ?

There have been made a vast number of tests upon aerofoils of all varieties of section, of the effects of using these aerofoils in various differing combinations and relations the one to the other, and there is in existence a 1 immense bulk of documents relating to such tests. These documents are not yet available for publication, but when, and if, they are published it will become possible to point out from amongst them some results which should lead to very important developments in aerodynamic design, more particularly amongst the tests of certain aerofoil sections which have very different characteristics from those now in general use.

But if one examines the machines which are at present in regular use by the Royal Air Force, it will be found that the great majority employ an aerofoil section: that had been actually tested and flown with success before August, 1914—or a very close imitation thereof.

Considering all these facts, one is forced to conclude that, great as aeroplane achievement has been during the last four years, the art of aeroplane design has undergone no startling change and is directly responsible for a relatively small proportion of the improved performances attained.

Some Further Considerations.

There remain, then, these points—(1) whether this lack of change is due to there being little room for further, improvement in the aerodynamic features of the present aeroplane, or whether the period of relative stagnation has been due to the suppression or discouragement of experimental work in the realm of applied aerodynamics ; and (2) if such a suppression has occurred, has it been due. to unavoidable causes created by war conditions, or to a mistaken direction on the part of the controlling authorities ? »

To the present writer's mind neither of these points is debatable. Not only is it unthinkable, on general grounds alone, that the field of research offered by aerodynamics has been explored so thoroughly as to leave room for no hope of any great improvement in virtue of better aerodynamic design, but it can be shown on the basis of tests carried out by certain branches of the Services that there have been built and flown certain experimental machines with characteristics which very considerably extend the possibilities of aeroplane design in certain important directions, and that the work which was actually carried out in this field was stopped by the prejudices of those in control of, the establishment which made the experiments, at just the period when it was possible to predict with certainty what could be achieved on those lines.

It is interesting to observe that the Civil Aerial Transport Committee has reported on the necessity, for commercial aviation, of exactly the characteristics which the experiments in question successfully achieved over two years ago, and that it is only within the last six months that the 'powers that be, on the urgent representations of one of the few aeroplane designers of imagination who are still permitted to design, have allowed an experimental machine embodying these characteristics to be put in hand.

Nor is this particular case unique. It is, on the contrary, more nearly the normal history of every effort at experimental work of a serious nature which has come within the reach of the authorities in control of aircraft design.

### **Delays in Experimenting.**

Experimental work of a very important nature has been carried on to an eventually successful end under those authorities, admittedly, but generally not until long after the original proposal to undertake it had been turned down, and very rarely has the work been entrusted to the originator of the proposal, or the credit thereof been bestowed upon those who made its success possible.

If these things are so, and they are admitted, in the main, by the ablest of the individuals who make up the amorphous agglomerate which affects technical direction of the Air Force, it is a matter of some importance to attempt to discover why they are so.

### **Good Technical Work.**

It is probably unknown to the majority of the people at home, even to many in the R.A.F., that much of the most valuable technical work in the war has been done overseas.

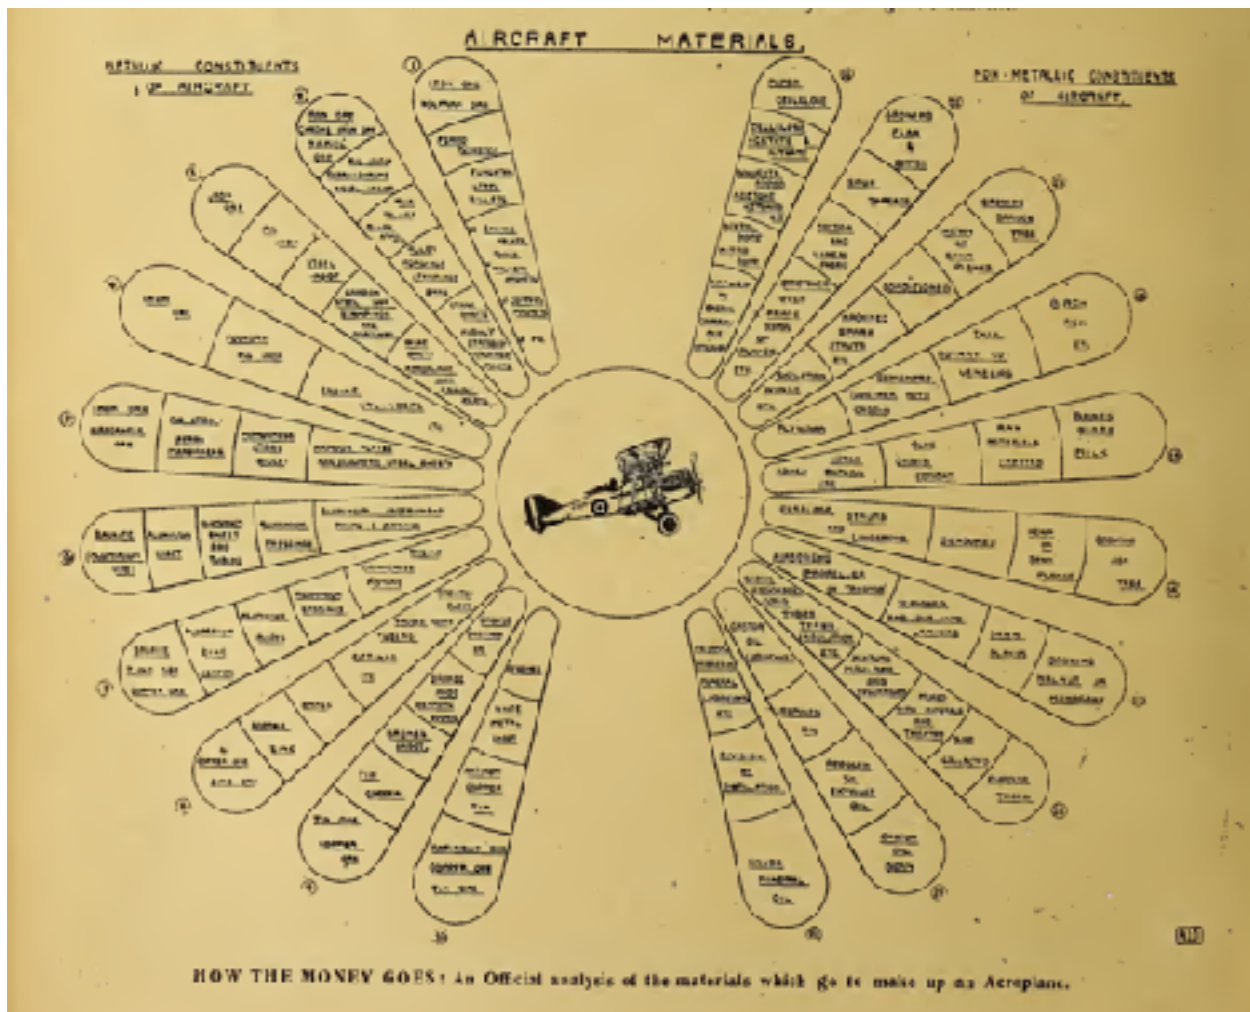

The various Aircraft Depots and Aircraft Supply Depots in France number among their personnel some of the cleverest engineers yet produced in connection with aeronautics.

Many of them were professional engineers before the war, though some were not, and they have learned all that is worth knowing about aircraft in the hard school of active-service experience.

At the old R.F.C. Headquarters all the knowledge gained in this way has been collected by a group of singularly competent technical officers, and one is certain that if this knowledge had been properly appreciated and properly used by the people at the Bolo House, the R.F.C. would have been very much better equipped at the end of the war than in fact it was.

## Notes on "Civil Aviation"

The experimental design work also done at Base G.H.Q. has been of high value and would have been of still greater value had the war continued .

“one rather gathers that, when some of these machines were put out to sub-contract, the originally delicate fittings designed and used satisfactorily by the (original) makers became objects of terror to real aeronautical engineers when made by blacksmiths and the like.”

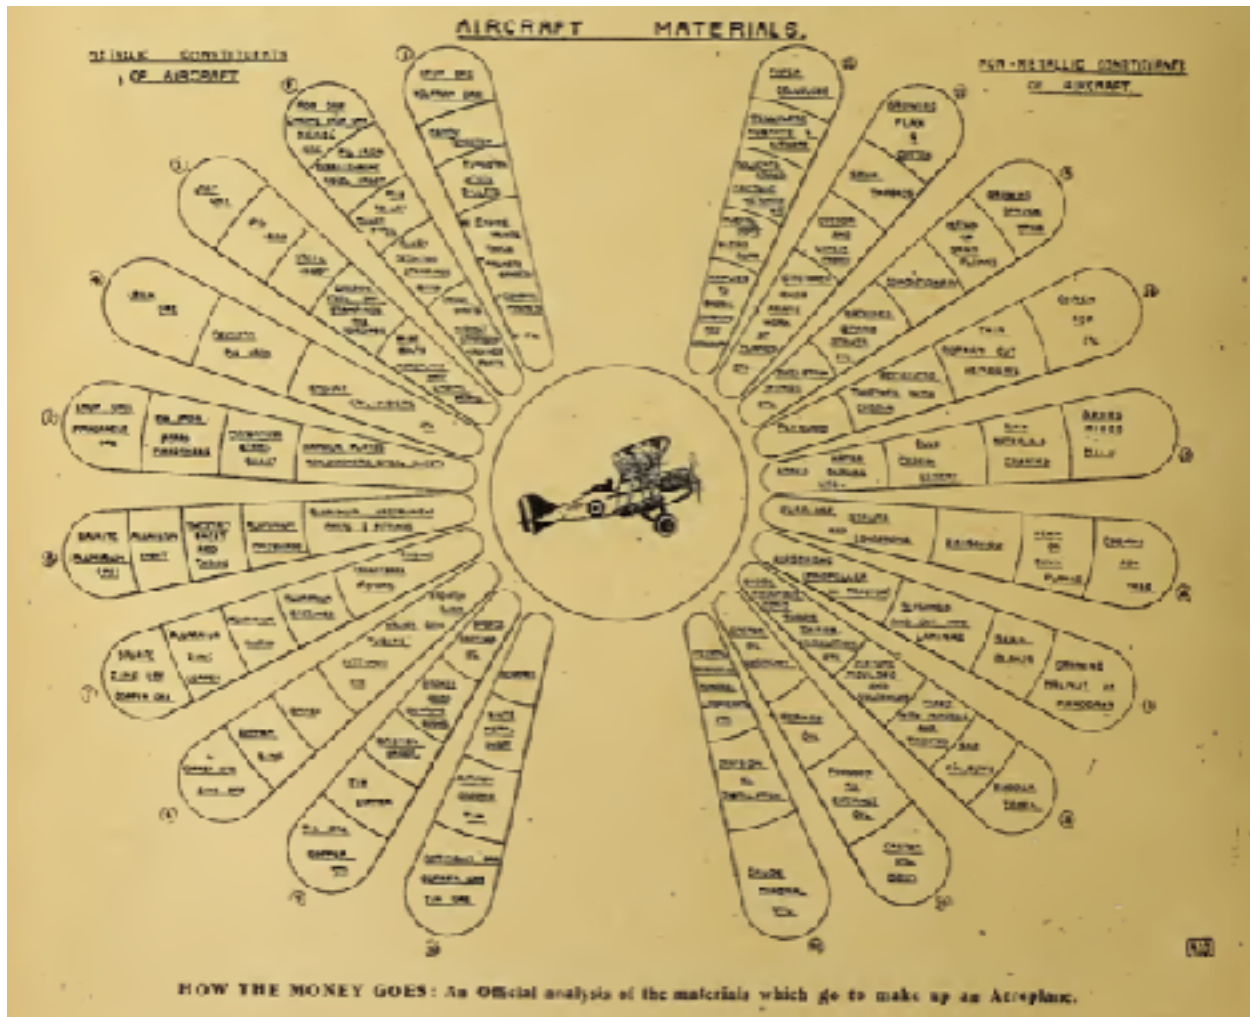

15 January 1919 - Aeroplane - The Development of Commercial Aviation by CG Grey

Consideration of the future development of Commercial Aviation naturally leads us along certain main lines of thought. First, there is the technical aspect—here we shall pit the brains of our inventors and engineers against those of the whole world, and we have no reason to fear the issue. It is true that in some other lines of inventive work we have left it to others to gather the fruits of our pioneering. In aviation, however, we have gained for ourselves the foremost place in design and technique of aircraft and engines, and British manufacturers may safely be trusted to maintain and improve their position. State assistance in design and research work, it is agreed on all hands, must continue. A policy of “ safety ” must prevail, and the aerial “ Plimsoll ” line and the “ Ai at Lloyd’s ” must brand every British aircraft with the hall-mark of quality and security.

26 March 1919 : Ottawa - AIR SERVICE IN CANADA - MOTION FOR RETURN.

Hon. M-NrT. ANNER removed for a return showing:

1. Whether the Government has divested itself of all aerodromes, airships and air service plant.

2. Also, whether such property is retained by the Government, where it is situated and of what does it consist.
3. Also, is there any air service organization or person in Canada acting under the Government: and if there is:
  - (a) of what persons does it consist;
  - (b) what is the qualification and rank of each person;
  - (c) where are they respectively located;
  - (d) what is each person's duty.

#### The Dangers of Flying.

the risk and danger of flying. This in reality is very much less than is often supposed. The improvements which have taken place in the design and construction of aero planes and engines have brought us to a position in which, with prudence and judgment, the risks of flying are very small, apart from the danger attached to the process of the training of pilots.

a considerable proportion of the accidents which occur are due to higher war training in aerial fighting and close formation flying and to the arduous conditions under which this training is carried out. Even under these conditions fatal accidents have been surprisingly few recently, and the average has now reached the high figure of 1,170 hours per fatal casualty.

Some idea of the risks of flying may be gained from the following facts :—Since January, 1916, 3,340 officers have been killed on the Western Front. The strenuous nature of the fighting is well known, and nearly all these have been due to Hattie and only a small proportion to accidental causes. The total flying done during the same period has been close on one million hours, or 114 years.

Legislation and Civil Aviation. all civil flying has been prohibited during the war, and, although fighting has ceased, we are still at war. As Lord Weir announced recently in a public speech, •draft legislation for the governance of civil flying is being prepared and is being pushed on with all speed. But the work and difficulties involved are very great, and it is most important that, even at the expense of a little delay, a really sound position should be arrived at. At the same time the Air Ministry recognise fully the necessity of early action so that the present restrictive orders may be as far as possible removed. Otherwise we might easily find ourselves at a disadvantage as compared with other countries in the early development of civil flying.

It has now been found that this private and domestic legislation depends for its character on the findings of the International Conference, and, to avoid delaying the commencement of private flying in this country, a preliminary set of regulations have been drafted, and it is hoped will come into force during the first few weeks of the new Parliament.

### The Organisation of Aerial Routes.

Dealing next with overland projects, amongst the many branches of the subject, one of the greatest importance will be the selection and equipment of aerial routes. This will be governed partly by geographical and, increasingly, by commercial conditions. Preparations on a large scale and much subsidiary organisation are needed to ensure the success of any chosen route. Landing grounds must be provided, and conspicuous marks and indications given. Repair facilities must be established where skilled personnel is available. The stopping places must be linked up with centres of distribution, of postal and other merchandise and arrangements made for the control of traffic both by day and night.

Here it is that private enterprise will derive the greatest benefit from the work that has been done by the Governments of the countries during the war. The greater part, however, still remains to be done.

### Military Aerial Transport

Quite apart from the numbers of officers who have been transported to France by aeroplane in machines going out as reinforcements, we have established, in the summer of this year, a small organisation called the Air Communication Squadron. It was organised on comprehensive lines and consisted of two flights of D.H.4s, with Rolls-Royce engines, and a few other machines, with a personnel of 61 officers and men. Between August and November there were made no fewer than 279 passenger crosscountry flights, such as to Paris, Nancy, Dunkirk, Manchester, York, and Birmingham, and, I am glad to say, that there has

not been a single case of a crash occurring to any machine with passengers on board. (Applause.) Many very distinguished people were transported, including several members of the British, French, American, and Dominion Governments. One hundred and thirty-one visiting machines.

### The Future of Airships

All that I have said so far has had special reference to heavier-than-air craft, but it may well be that, for commercial purposes, the airship is adapted for long-distance journeys involving nonstop flights. The airship has the inherent advantage over the aeroplane that there is practically no limit whatever to its range provided it can be made large enough.

The large rigid airship is still in an embryonic stage, but sufficient has already been accomplished to show that with increased capacity there is no reason why they should not be built capable of completing the circuit of the globe.

### The Organisation of Commercial Aviation.

I come now to the next great division of the subject of commercial aviation, the organisation and "machinery" which will be so necessary to the successful operation of commercial flying. During the war a great amount of experience has been gained, and though it is true that the conditions of war and peace differ widely, and that the most economical method, may not always have been adopted, certain fundamental conditions have become apparent, which will undoubtedly govern commercial flying in the same manner that they have governed war flying.

It is here that the experience gained by the Royal Air Force will be of inestimable value to commercial aviation. They are, indeed, so far as this country is concerned, the sole experts upon the subject, and their work must form the foundation of commercial aviation practice.

I want to say a few words about the many difficulties which will have to be overcome in fully developing air routes. Firstly, there is the International Conference with regard to aviation about which I have spoken, but even when agreement has been reached, much diplomatic machinery remains to be set in motion before aerial services can be actually started. The Royal Air Force has lately been engaged, for instance, in preparations for a postal service across the North Sea, but in regard to these, as we are still legally in a state of war, there is, for instance, the difficulty of the three-mile territorial water limit, upon which agreement must be reached.

### Aerial Navigation.

Closely connected with the subject of Meteorology is one of equal importance—Aerial Navigation. Here also great progress has been made, especially in navigation in fog and misty weather.

At the commencement of the war the only instruments available for navigation were the compass and map. Since then, compasses have been much improved and many other instruments developed.

The Aerial Navigator has to work under difficult conditions.

He is in a confined space and navigates a craft whose speed is double or treble that of water-craft. In place of tidal currents he has to contend with the winds of anything up to 50 miles per

## Notes on "Civil Aviation"

hour; changing in direction and velocity at different heights, and carrying his craft with them at their own speed and direction. The first step forward was an instrument to determine the angle between the direction in which the machine was pointing and the direction of her path over the ground. That has been solved.

### The Period of Transition.

The period of transition in which aviation in this country, and indeed, all over the world, is at this moment a very difficult one both for those who are waiting impatiently to put into practice their plans for commercial development, and also for those who have held aviation in their grip for the last five years, and who are now about to relax it.

I have also indicated some of the steps that are to be taken to place aviation on a proper commercial basis, and I want to assure you once more that everything possible is being done by the Air Ministry to hasten matters forward and to mature plans for the transition of aviation from a war to a peace basis with the least possible delay and confusion.

May

J'j

in conclusion

. quote a few lines from Adam Smith's

Wealth of Nations," written 100 years ago, which yet bears on our subject as fitly as though it had been written to-day. "The judicious operations of banking, by providing, if I may be allowed so violent a metaphor, a sort of waggon-way through the air enable the country to convert a great part of its highways into good pastures and cornfields, and therein to increase very considerably the annual produce of its land and labour." His metaphor was not so violent after all, and the "waggon-way" through the air is about to be realised.

A number of most interesting views were then thrown on the screen.

### R.A.F. CADETS.

With reference to the notice published last week concerning demobilised Cadets of the Royal Air Force being permitted to extend their service, as misapprehensions may arise it is pointed out that such Cadets can only "extend their service as ordinary airmen and not as Cadets

two R.A.F. officers in reaching the unprecedented height of 30,500 feet on a D.H.9 machine proves yet again the remarkable lifting power, climb and endurance of Airco Machines.

Known as the D.H. or Airco 9, this machine was designed by Capt. Geoffrey de Havilland, Technical Director of the Aircraft Co., and is fitted with a "Napier" Lion Engine.

### Engineers and Demobilisation.

The following letter has been received from the Secretary of the Crystal Palace Old Students Society :

—

28, Victoria Street, Westminster, S.W.

## Notes on "Civil Aviation"

Dear Sir,—At the present time a very large number of engineers who formerly held good appointments are looking forward with some anxiety to the time when they will leave the Army, Navy, or Royal Air Force and have to find positions in civil life. Similarly, in view of the great work of reconstruction, employers must know that sooner or later they will be needing competent men, and may have some difficulty in finding them.

I should esteem it a very great favour if you would publish this letter, the abject of which is to call together old students of the Crystal Palace Engineering School for co-operation in dealing with the problems of demobilisation as affecting engineers. Over 2,000 engineers have passed through this school, the addresses of many are unknown to me, and they include many men holding the highest positions- in the profession. The Council of the Crystal Palace Old Students Society feel that they can do good work in this respect, not only among their own members, but for many others.

May I therefore ask you to insert this letter as an appeal to all old students of the Crystal Palace Engineering School or others interested in the subject to communicate with me by letter.

I would add that this is not an ordinary employment bureau, and that no fees of any kind are to be charged.

I am, yours very truly,

H. C. H. Shenton (p.p. E .

) , Hon. Secretary.

May 07 1919 - Aeroplane CG Grey - ON MATTERS ACTUAL, AL,  
By Captain P. A. Barron (late R.A.F.).

### The subject of Aviation Insurance

#### A Very Unprofitable Crash.

This means, one presumes, that if an insured machine crashed after the completion of 600 flying hours the owner would be entitled to nothing whatever.

To put the proposition in another way, if the machine were to fly two hours each day (excluding Sundays) its value would be regarded as nil at the end of a year.

Now, as machines and engines are at the present time, it would be quite impossible to keep an aeroplane in commission for one year without renewing a great many parts. In the case of the engine a large number of the wearing parts such as valves and valve operating gear, bushes, pistons and rings would have been replaced many times over before the year had expired. The aeroplane would in all probability consist of only a small proportion of its original parts and the remainder would be new. If it had received proper attention throughout the year it should be as airworthy at the end of the twelve months as it was at the beginning.

The system, therefore, of depreciating its value solely in accordance with the number of hours flown strikes one as absurd.

#### Nothing left of the Machine except the Number.

One may with advantage consider the methods employed in the R.A.F. A machine was taken over from the manufacturers and allotted a certain number. In course of time it might be fitted with a new engine, new planes, a complete undercarriage, and possibly the fuselage might be entirely re-built. Thus practically nothing of the original machine would be left except the number, and that might be painted on a new rudder. But it would be absurd to say that the machine was less airworthy at the end of its service. It was equally safe, and, providing that the replacements had been made efficiently, it should have had an equal insurable value throughout its life.

Now when we consider the problem of aircraft insurance one fails to see why one should assume that commercial firms will not apply the same methods, in this respect, as those of the R.A.F.

One presumes that they will not be allowed to fly machines that are not airworthy, as one has been assured that aircraft will be inspected daily by licensed ground engineers.

Some Entirely New Problems.

## Notes on "Civil Aviation"

The particular point one wishes to drive home is that in the insurance of aircraft one cannot be guided entirely by analogies. Aeronautical actuaries (may one call them Actuaerial experts?) have entirely new problems to solve. They should realise that the number of hours during which a machine has flown is not the chief factor that should determine the premium. Airworthiness is the premier consideration.

In the Air Navigation Acts, 1911-1919, Directions issued by the Secretary of State for Air under para. 3 (2) of the Air Navigation Regulations, 1919, dated April 30th, 1919, one finds the following :—

-

"8. Aircraft certified daily by such Licensed Ground Engineers will be periodically re-inspected by a person or persons duly authorised by the Secretary of State, who reserves the right to suspend or revoke licences granted as above, should such certified aircraft be deemed by him as a result of such examination to be unsafe.

"9. Ground Engineers certifying flying machines or engines as airworthy after overhaul, must be in a position to certify that all the conditions required for the inspection of subsequent aircraft during construction that apply to the overhaul have been carried out.

The Secretary of State reserves the right to suspend or revoke the licence of the Ground Engineer responsible for certifying that the overhaul has been correctly carried out, should a test inspection be deemed by the former to indicate that the flying machine is not airworthy."

A Suggestion.

One would, therefore, suggest that in the present darkness of our inexperience insurance policies should be issued for short periods, for example, three months, and should be renewable for similar periods at perhaps a slightly higher premium, so long as it can be shown that the official inspections prove the machines to be airworthy, and that replacement have been made as required.

Tuesday, April 29, 1919. - ottawa : CONTROL OF AERONAUTICS.

Hon. A. K. MACLEAN (for the Minister of Naval Service) moved for leave to introduce Bill No. 80, to authorize the appointment of an Air Board for the control of aeronautics.

He said: Mr. Speaker, I might very briefly give to the House the chief features of this Bill on its first reading. It will be necessary owing to the development of aeronautics in Canada and in other countries that there be appointed a body to administer this service in this country. The Bill proposes the establishment of an Air Board (?) consist of not less than five and not more than seven members to be appointed by the Governor in Council. It is intended -that the Chairman shall be a minister of the Crown and that the Department of Militia and, the Department of Naval Service shall each be represented on the Board, by one member. The duties of the Air Board will be:

- (a) To supervise all matters connected with aeronautics;
- (b) to study the development of aeronautics in Canada and in other countries, and to undertake such technical research as may be requisite for the development of aeronautics ; and, to co-operate with other institutions in carrying out such research;
- (c) to construct and maintain all Government aerodromes and air stations, including all plant, machinery and buildings necessary for their efficient equipment and upkeep;
- (d) to control and manage all aircraft and

equipment necessary for the conduct of any of His Majesty's services;

(e) to operate such services as the Governor in Council may approve;

(f) to prescribe aerial routes;

(g) to co-operate with other officers of His

Majesty and to assist in the carrying out of any services under their jurisdiction which may require

aerial work of any nature, and to collaborate

with the officers employed in existing

air services of His Majesty in such extension of

their present work as the development of aeronautics may require;

(h) to take such action as may be necessary

to secure by International Regulation or otherwise,

the rights of His Majesty in respect of

His Government in Canada in International Air

Routes ;

(I) to co-operate with the officers of the Departments of Militia and Defence and of the

Naval Service on all questions relating to the

air defence of Canada;

(j) to co-operate with the air staffs or

authorities of other Governments or countries

for any purposes pertaining to air services;

(k) to investigate, examine and report on all

proposals for the institution of commercial air

services within or partly within Canada, or the

limits of the territorial waters of Canada;

(l) to consider, draft and prepare for approval

by the Governor in Council such regulations

as may be considered necessary for the

control or operation of aeronautics in Canada

or within the limits of the territorial waters of

Canada; and,

(m) to perform such other duties as the

Governor in Council may from time to time impose.

It is also intended to give to the board

power subject to approval by the Governor

in Council:

To regulate and control aerial navigation

over Canada, and the territorial waters of

Canada, and in particular, but not to restrict the generality of the foregoing terms of this

section, it may with the approval aforesaid,

make regulations with respect to-

(a) licensing pilots and other persons engaged

in the navigation of aircraft and the

suspension and revocation of such licenses;

(b) the registration, identification, inspection,

certification and licensing of all aircraft;

(c) the licensing, inspection and regulation

of all aerodromes and air-stations;

(d) the conditions under which aircraft may

be used for carrying goods, mails and passengers,

or for the operation of any commercial

service whatsoever, and the licensing of any

such services;

(e) the conditions under which goods, mails

and passengers may be imported and exported

in aircraft into or from Canada or within the

limits of the territorial waters of Canada or

may be transported over any part of such

territory;

(f) the prohibition of navigation of aircraft

over such areas as may be prescribed, either

at all times or at such times or on such occasions,

only as may be specified in the regulations,

and either absolutely or subject to such

exceptions or conditions as may be so specified;

(g) the areas within which aircraft coming from any places outside of Canada are to land, and the conditions to be complied with by any such aircraft.

The purpose of the Bill as I have said is to control and regulate and to prescribe laws for the conduct of aeronautics in Canada. It is deemed advisable to constitute a board for the time being as the most practicable method of dealing with this new subject. Possibly after a year's trial of the proposed legislation it may be found that some other legislation may be considered necessary.  
Motion agreed to and Bill read the first time.

01 May 1919 The United States is represented at the peace conference<sup>139</sup> by Brig.-Gen Benjamin D. Foulais, Major Pollock & Captain Bacon. The proposed convention on international aerial navigation is completed by the Judicial and Military committees of the aeronautic commission of peace. composed of 41 articles. "The duty of the International commission on aerial navigation is to be formed - its' duties: to gather and disseminate radio-telegraphie, meteorological and medical information,

05 May 1919 :

CIVIL SERVICE APPC>INTMENTS.

'Mr. 'McCURDY:

1. Is it the present practice of the Civil Service Commission in making appointments to the Civil Service to stipulate that all appointments shall be considered as temporary until the period of demobilization shall have passed?
2. If not, is it the intention of the Government to prevent further permanent appointments until demobilization has been completed?
3. If not, what steps has the Government taken to insure that men yet on active service shall enjoy an equal opportunity to compete for these positions?

Hon. Mr. BURRELL:

1. No. All appointments of a permanent character are made from eligible lists of candidates who have passed prescribed examinations or have been successful in open competition after public advertisement. In both cases returned soldiers are required to possess only the minimum of qualifications when they take precedence over all civilians no matter how highly qualified. Permanent appointments are not made except on specific request from the department.
2. Until demobilization has been completed, it is not the desire of the Government that permanent appointments to the Civil Service should be made except in those cases where it is necessary in the public interest.

<sup>139</sup> [https://archive.org/stream/Aviation\\_Week\\_1919-05-01#page/n15/mode/1up](https://archive.org/stream/Aviation_Week_1919-05-01#page/n15/mode/1up)

3. Answered by No. 2.

ADVERTISING OF CIVIL SERVICE

VACANCIES.

Mr. POWELL:

1. By what means are vacancies in the Civil Service of Canada advertised?

2. Does the Civil Service Commission always advertise in the newspapers?

3. If not, under what circumstances are such advertisements published?

4. If so, what newspapers are authorized and paid by the department for such publications?

Hon. Mr. BURRELL:

1. The columns of the Canada Gazette, a mailing list of all persons known to the commission as likely to be interested, posters sent places of public resort, such as post offices, banks, libraries, colleges, universities, offices of the Great War Veterans' Association and its branches, and, in

a few special cases, by newspapers. 2. No.

3. In the case of certain local positions, when a small advertisement in the local press seems to be the only means of bringing the notice of the vacancy to knowledge of persons interested, or when the other means of publicity have failed to secure a suitable applicant for a local position.

4. None. The paper, or papers, with the largest circulation in the particular centres where the vacancies occur are chosen in each case.

CONTROL OF AERONAUTICS-APPOINTMENT OF AIR BOARD.

On the motion of Hon. A. K. Maclean  
Bill No. 80 to authorize the appointment  
of an Air Board for the control of Aeronautics  
was read the second time and the  
House went into Committee on the Bill,  
Mr. Boivin in the Chair.

On section 1-Short title:

Mr. BELAND: Has the minister given a  
general explanation of this Bill?

Mr. A. K. MACLEAN: I really cannot  
say anything more than is stated in the  
Bill which I explained briefly on its first  
reading. Obviously there must be some development  
in commercial aeronautics in the  
immediate future. During the war the development  
in aeronautics related almost entirely  
to military and naval affairs. Private  
and commercial aeronautics was prohibited  
altogether and consequently there  
was no development along these lines. It  
is necessary, in view of the probable development  
of aeronautics, that there should  
be some governmental control of such matters  
and it is proposed to establish a Board  
which shall have entire control of any Government

or commercial service. If my hon. friend will look at section 3 he will see there set forth the duties of the Board which will cover fully, I think, all the probable activities in aeronautics. Section 4 is the other important clause and that empowers the Air Board to establish regulations for the control of aeronautics.

Section agreed to.

On section 2--Air Board; chairman and vice-chairman; representatives of Militia and Defence and Naval Service Departments; term of office; salaries.

Mr. A. K. MACLEAN: It is not proposed to establish another department to administer this Act. I would suppose that most of the members of the Board would be selected from established departments of the Government. The administration of the Act will be largely in the hands of the vice-chairman of the Board who will be the chief executive officer. It is necessary, of course, to have representatives of the Naval and Militia Departments upon the Board for the reason that heretofore they have been very much and practically interested in aeronautics. Consequently it is proposed that they shall have direct representation on the Board. It might be urged that the Post Office Department, the Interior Department, the Dominion Police and some other departments should be represented on the Board. However, there was a reason at the moment existing for the representation of the two departments I have mentioned and it is not deemed advisable that other departments which may possibly be interested in aeronautics in the future should all be represented on the Board. But, it will be understood that this measure is of a temporary nature. I have no doubt that in the working of it during the coming year weaknesses will develop but experience will enable us to pass legislation which will be more satisfactory.

Mr. MORPHY: I have listened to the statement of the minister and I would judge from it that his intention is to set up a theoretical Board rather than a practical one. Otherwise, he would have stated the fact that we have a large number of the finest Canadians who have ever done service for their country many of whom have returned to Canada after real practical service on the battlefields of Europe. While there may be men who have been employed with the military and naval services in Canada this is a very opportune time of recognizing

the boys who have been fighting for their country, and doing good practical work, and of calling to the service of the country some of these young men who fought for it. I will leave that with the minister. I think that there should be some recognition given to these boys who have done their duty overseas.

Mr. A. K. MACLEAN: Doubtless the committee which my hon. friend refers to will be represented on the Board.

Mr. OOPP: Has there been any consideration given to the question as to the salaries that will be paid as to those who serve on this Board?

Mr. A. K. MACLEAN: No consideration so far has been given to the matter. It is impossible to give any information to my hon. friend which will be at all reliable at the moment. Possibly the chief executive of the Board will be one who is now employed in some department of the Government. The other members may possibly serve without pay. The development will be largely commercial and perhaps it will not be very extensive for a time. I am hopeful that all the members of the Board will not be paid.

Mr. OOPP: Is any provision being made in the Estimates this year for this service?

Mr. A. K. MACLEAN: There will be in the Supplementary Estimates.

Mr. OOPP: You could give us some idea from that.

Mr. A. K. MACLEAN: The Committee will have some idea of the probable expense when the Supplementary Estimates are brought down.

Mr. STEVENS: Will the minister kindly state if it is in the mind of the Government that this Board shall at an early date undertake the commercial development of aeronautics, not with the idea, that it is to be merely an adjunct of military and naval development but with the idea of taking up definitely the commercial development?

Mr. A. K. MACLEAN: If my hon. friend is inquiring whether the Government intends entering into the field of commercial aeronautics, I am bound to reply that it has not yet considered the matter from that aspect. The operations under the Act will, of course, largely relate to commercial activities; I would expect that for the next few years, at least naval and military activities in aeronautics will be very limited, indeed.

Mr. J. H. SINCLAIR: I do not think the minister has given the Committee very much information as to the functions which this board is to perform. I have not got any clear idea as to whether it is simply to manage aeronautics in connection with private enterprise, or whether it is to embark upon some large scheme of civil aviation.

The CHAIRMAN: The remarks of the hon. member will be in order when we take up the next clause.

Mr. CAHILL: Has the Government any idea with respect to its future policy on the subject of aeronautics?

The CHAIRMAN:—The remarks of the hon. member will be more in order when we take up clause 3.

Mr. McKENZIE: Before we pass this clause I would like to ask if the operations of the board to be created under this Bill are to be centered at Ottawa?

Mr. A. K. McCLEAN: Yes.

Mr. McKENZIE: It will be an organized body under the supervision and control of some department of the Government?

Mr. A. K. McCLEAN: Yes.

Mr. McKENZIE: Is it intended, in connection with the operations of this board, to establish an institution or school where practical and theoretical instruction in aeronautics will be imparted so as to render a man thoroughly competent to take charge of an aeroplane?

Mr. A. K. McCLEAN: Up to the present moment it is not the fixed or settled policy of the Government to establish a school for the purpose indicated. Speaking generally, the Government has no settled policy in respect to aeronautics. The Militia and Naval Departments, during the period of the war, carried out a programme, but it has now practically ceased. It was necessary to first enact legislation before any fixed policy could be adopted by the Government in respect of any form of aeronautical activity. Many applications have been received from commercial companies for the establishment of aeronautical routes throughout Canada; and, as I said a moment ago, it is open to the Government to embark upon various forms of aerial activities, such as the conveyance of the mails, the survey of forest, fire protection, patrols by the mounted police, and so forth, but at the present time, the Government has reached no definite policy in

respect of any of these matters.

Mr. McKENZIE: What will be the real function of this board after it has been organized? What will it start out to do?

Mr. A. K. MACLEAN: The immediate purpose of this legislation is chiefly to control aeronautics in Canada, established by any Government department or by private corporation. For example, it is not within the right of any individual to fly in the air with aeroplanes or hydroplanes, or any other machine of the kind, although there is no statutory law which directly prohibits it.

Mr. McKENZIE: It is entirely unknown to the common law.

Mr. A. K. MACLEAN: It is unknown to both the common law and the statute law. Consequently, nobody can legally engage in flying to-day, and in none of the provinces, nor in Canada, is there any statutory authority for any body to grant licenses for the purpose. This board must establish aerial routes, or to put it in another way: If a commercial company desires to carry on an aerial service between, say, Montreal and Toronto, their route should be first established and that would be one of the functions of the board. The machines used should be licensed and inspected just as a steamer is. The pilots and the crews must also be licensed, and that will be another function of the board. Furthermore, regulations must be enacted, compelling flying machines to use telephonic or wireless apparatus, and in relation to many other matters which do not occur to my mind at the present moment. I think a very close parallel to the control of aerial navigation is the control which we exercise over shipping, with, of course, the very notable difference that one operates on water and the other in the air. Generally speaking, the object of the legislation is to put ourselves in a position to control aeronautics, chiefly commercial, as that is the form we shall likely have in the immediate future in Canada.

Mr. ERNEST LAPOINTE: By this Bill, according to the minister, Parliament is establishing its authority over aerial routes and all matters concerning air craft. But does my hon. friend think that if a company, for instance, established a line between Montreal and Quebec, to operate exclusively within the limits of that province, it would be a provincial matter, and that the company in question should not come under the authority of this Parliament unless

its undertaking is declared to be for the general advantage of Canada? My hon. friend classifies aerial navigation with marine navigation, but article 92 of the British North America Act declares that a provincial legislature may exclusively make laws in relation to the matters coming within the class of subjects "hereinafter enumerated," and article 10 of section 92 sets forth: Local works and undertakings other than such as are of the following classes—  
Lines of Steam or other Ships, Railways, Canals, Telegraphs and other Works and Undertakings, connecting the Province with any other or others of the Provinces, or extending beyond the limits of the Province.

Therefore if such a company were operating exclusively within the limits of one province it would be a provincial matter, and I do not think this air board could fix the route, or control the license to pilots, and other matters in connection with it.  
Mr. A. K. MACLEAN: The constitutional question, of course, arises in connection with this matter, and had it been pointed out to the Fathers of Confederation that we might possibly have this aerial development in later years, it would be difficult now to say whether it would have been placed in clause 91 or 92 of the British North America Act.

Clearly, the legislation, if enacted, would cover interprovincial aeronautics, and consequently to that extent the Federal Government would have control. Whether it has control over purely provincial aeronautics is a question open to very much doubt, and possibly it will have to be settled ultimately by the courts. There is a clause in the British North America Act which in effect states that subjects not assigned to the provinces fall within Federal jurisdiction. Aeronautics were not placed in the list of subjects assigned to provincial jurisdiction, and therefore it is arguable, that the subject falls within Federal jurisdiction. However, any doubt we may entertain, on the point does not affect the competency of Parliament to pass this legislation, although later it may be held by the courts that it is only *intra vires* in so far as it affects interprovincial aeronautics.

Mr. LEMIEUX: I do not know if this development of transportation was known before Confederation, but two of the greatest poets of the 19th century, Lamartine and Tennyson, predicted that some day we would see argosies floating in the fair blue sky.

Mr. A. K. MACLEAN: And Jules Verne

also.

Mr. LEMIEUX: Yes. I think the objection of my hon. friend from Kainouraska (Mr. Lapointe) was well taken. It seems to me that as the Government is so anxious to have Government ownership of all kinds of transportation, it should not lose this favourable opportunity of furthering that project. There is no incubus attached to aerial as there is to railway transportation, and the Government should take control of this new industry, which, no doubt will develop to a very great extent in the near future. The British Government have already organized an aerial postal service and have mapped out three routes, one for freight, another for passengers, and a third for some public service, I think the postal service. The United States also have organized a postal service between Philadelphia, Washington and Baltimore.

Mr. ROWELL: And New York.

Mr. LEMIEUX: This may be only a tentative service-

Mr. A. K. McLEAN: I think it is experimental.

Mr. LEMIEUX: That is what I mean.

But it seems to me that the Government should take into serious consideration the propriety of experimenting in this matter. Perhaps we would save enormous railway subsidies by organizing an aerial postal service. I regret sincerely that the Government did not take over the magnificent plant which the Imperial Munitions Board erected at Camp Borden during the war. Unfortunately the whole plant was sold to an enterprising Yankee, and Canada lost thereby an excellent opportunity. If it is not too late, I would urge upon the Government the necessity of taking over that plant and giving Canada the benefit of it. We do not lack enterprise in aeronautics. During the war our young men showed that they were equal to the best among the Allies in that particular sphere. I need name only one of them who is world famous-Bishop. We have not only the men, but we have all the elements that constitute the material part of the industry itself. During the war the Imperial Munitions Board found in British Columbia the timber which was hewn for the construction of aeroplanes, and I understand they went even as far as to subsidize very heavily a branch line several miles in length in order to tap the district where that special timber was obtainable in large quantities. It seems to me that the Government should

be extremely careful in its legislation,-- more careful than it appears to have been in the present instance, -- --o as to this industry in the right way.

The CHAIRMAN: Before I permit any more speeches on the principle of the Bill, I must ask whether it is the unanimous consent of the Committee that the principle of the Bill be discussed at this time. If not, I shall have to call the Committee to order. I called an hon. member to order a moment ago on this ground. I did not want to interrupt the hon. member (Mr. Lemieux) but the rules of the Committee are not being followed, and this accounts in great measure for the length of the session. Is it the pleasure of the Committee that the principle of the Bill be now discussed? Some hon. MEMBERS: No.

Mr. CAHILL: Will this board be empowered to grant licenses to any persons who wish to establish lines between Ottawa and Toronto, or between other points? Mr. A. K. MACLEAN: Yes.

Mr. CAHILL: If a company which established a line between Ottawa and Toronto wanted to establish a line also between Ottawa and Montreal they might ignore the specified landing places around Ottawa and lease for a trifling sum landing rights on any field within a reasonable distance of the city. Would it be within the power of this board to say that no company should have exclusive right to own territory for landing purposes? Airmen are now ready to leave Newfoundland for England; they have all decided to start at about the same place. It is possible that Prince Edward Island would be a very satisfactory landing place--perhaps more satisfactory, on account of the absence of fog, than any other part of the eastern coast. Some company, if you gave them a franchise, might go in there and blanket the whole island for a trifling sum, obtaining exclusive right to land there. Is it intended to give these companies any such exclusive franchise as was given to the Bell Telephone Company in the early days, when it was thought that no one else would be in a position to compete with them? Before this board is established, before they take power to tie the country up to anything, it would be well for the Government to have a well-defined policy in this matter; it would be well for them not to go too fast until they know what the outcome is likely to be.

Mr. A. K. MACLEAN: The only thing I

can say in reply to my hon. friend is that the Government have not in mind the granting of exclusive privileges in respect of certain routes to any individual or company which may be organized. But we must be guided largely by experience in this matter. While at the moment it may seem undesirable to grant exclusive privileges to any person or persons, still a limitation of licenses granted to individuals along certain routes may be necessary. It might, for instance, be perfectly proper to grant a license to twelve or twenty-four persons to fly between Ottawa and Toronto, but, in the light of experience, it might be considered improper, possibly dangerous, to grant licenses to several hundreds or several thousands. As I have already indicated, the policy of the Government in this matter is not yet fully considered or matured. We shall be guided very largely by efforts which are made to develop aeronautics commercially by individuals or corporations. My hon. friend might suggest the propriety of our establishing a mail service between Nova Scotia and New Brunswick and Prince Edward Island. That might strike one as a very desirable place to experiment in aerial mail service. I should not like to speak for the Government at the moment and say that they propose establishing such a mail service, but naturally, in the course of time, the Government must develop a policy in respect to these matters. If there is great activity on the part of private interests and private capital, it might be well to allow such interests to do a great deal of experimenting.

Section agreed to.

On section 3-duties of Air Board:

Major-General MEWBURN: I was glad to hear the remarks of the member for Maisonneuve (Mr. Lemieux) with regard to our taking over some of the property at Camp Borden. The Imperial Munitions Board spent a large amount of money in Canada in connection with the Royal Air Force. They had a school of aerial gunnery at Beamsville, on Lake Ontario, which we did not consider it advisable to touch. They also had large buildings at Deseronto and large aerodromes and plant at Camp Borden where they spent millions of dollars. When the armistice was signed I immediately took the matter up with the Imperial Munitions Board and all that plant and machinery was transferred to the Militia Department. It was difficult for us to determine from a military standpoint what should be done

as regards the air force. I realize what wonderful work the Canadiens did in the Royal Air Force, and while it seemed to me that we could not utilize that force in Canada for training purposes, I thought it my duty to protect, as well as possible, their property and equipment. Therefore, the buildings and all the equipment there were handed over to the Government for a mere song, and they are on our own training-ground, Camp Borden, which is recognized as one of the best training grounds on the North American continent and which has been used for training American fliers. We also had handed over to us, free of cost, a large number of airships and also a quantity of maps and so forth, and we have retained a very small staff there to protect them. Some of the buildings we expect to utilize as hospitals, thus saving the erection of hospitals. At Long Branch, on Lake Ontario, where the rifle ranges are, the Imperial Munitions Board erected a number of buildings which have been handed over to us, but other properties which were on leased ground were scrapped. All the property I have mentioned is intact, and we have the facilities for continuing training and developing an air force in the future. When my Estimates were being discussed the other night, I was discussing the reorganization of the militia, and if we have to reorganize the militia for defence and other purposes, no doubt an air force will form part of it. That, however, was one of the subjects that we decided the commission would deal with, and as regards the Air Board, I sincerely trust the magnificent men who have made such a name for Canada in the air will have the first opportunity of being recognized in this. Many of them are coming back and are now talking of the commercial side of the industry which is being developed in England. We have a large quantity of information both from France and England as regards air forces, and I sincerely trust that our men who have made good in the air from a military standpoint will be able to make a success in the air from a commercial standpoint.

Mr. LEMIEUX: Were there any Canadians associated with the American who bought the whole of the aerial property in Toronto?

Major-General MEWBURN: I do not know that there were. Colonel Bishop told me that he expected to be interested in some British machines for which he was

offered the agency. and while hie had not worked out just what he was going ta do, he hoped ta be able ta deveiop in this country same commercial enterprise, possibi y in canjunction with the postal service.

This Air Board is oniy a temporary one ta study the question, and the Department ai the Naval Service is represented on At merely ta keep in touch with a view ai developing something in the future.

Mr. LEMIEUX: I canna t agree with Shakespeare's lines: What's in a nanie? I wouid sug-gest that the minister have Coi. Bishop on the first aerial board in Canada.

Mr. MIDDLEBRO: I shoud like very strongly ta second the suggestion ai the hon. member. Col. Bishop is a native ai my tawn and is a son ai my former legai partner. I have known him from the day he was born ta the present time, and hie is to-day the world's champion living airman, having brought dawn seventy-two aerapianes. He is a boy ai whomn any country niight be praud, apart aitgether from his ability and record as an airman. I wauid respectfully suggest that anything that can be done by the nlinister ta secure his services an this Air Board wouid be one ai the best moves the Minister ai Militia could make I understand he served for a time an the Administration Board in connection with the air service in London, England, and wouid he admirabi y qualified for the position, though I do flot know if he wouid accept it at the present time.

Major-General MEWBURN: I do not think any saia y the Militia Department could affer Coi. Bishop wouid induce hΦm ta take such a position. I have had many consultations with him, but at the present time he is making something like \$30,000 a month under contract in the United State-.

Mr. LEMIEUX: I am sorry, because I wouid like ta see a " bishop"- associated with the present Government.

Mr. COPF: Under -subciause (b) of section 3 this Air Board can travel throughout the whole country studying this question, wΦthout let or hindrance on the part of any one.

They may go even into other countries, as they see fit. Under subciause (c), they have power to construct and maintain al Government aerodromes and air stations, including ail plants, machinery and buildings necessary for their efficient equipment and upkeep. in these two clauses, the approvai ai the Governor in Council is apparently not necessary, and I shauid like to know whether or nat it is

the intention of the Government to give such wide powers to this Aerial Board.

Mr. A. K. MACLEAN: The purport of subclause (b) of section 3 is merely a direction to the Air Board to take cognizance of and to study aeronautical development in all countries of the world. It does not imply that the board is to travel as a body to do research work in connection with this matter. It might conceivably at same time be desirable for a member of the board to visit some countries to study the development there taking place, but I do not anticipate that much in the way of travelling will be done by members of the board for a considerable time. I think, however, it is a very proper provision that members of the board be directed to study the development of aeronautics in all countries in the world. Section 7 says that all the moneys proposed to be expended under this Bill must be voted by Parliament, so that Parliament will have control over the matter.

The purport of subclause (c) is to place in the hands of the Air Board the absolute control of the construction and operation of any air service owned by the Government.

If the Post Office Department should decide to establish a service between Halifax and Newfoundland, or Halifax and Charlottetown or Halifax and St. John the control of the service would be in the hands of this Board. The Board will also control any services which originate in either the Naval Department or the Militia Department, and this clause places in the hands of one body all matters relating to aeronautics. I trust that this will commend itself to the judgment of my hon. friend. For the time being it seems the best thing to do.

D and E are similar in character to C: it simply gives the Board the control and management of all aircraft and equipment necessary for the conduct of any of His Majesty's services. Possibly the Government may establish other services of its own, but in any event, such services when once established, and so long as this legislation stands upon the statute books, will be under the control of the Air Board.

Mr. COPP: I would not like my hon. friend to think that I am raising any objection to the passage of the Bill. My only object is to get some information in regard to it. The minister suggested that the possibility in the near future of a postal air service between Prince Edward Island and the mainland. Suppose a private individual

started such a service, would this Board have the right to designate the landing places on the island and on the mainland and undertake the expenditure of public money in regard thereto?

Mr. A. K. MACLEAN: If it were a Government service, yes; and if it were a private service, still in some respects the Air Board would have control. For instance, it might very properly designate the route to be followed by the service, and should certainly have the right of licensing machines and naming the landing places. In the case of a private concern, the Government, of course, would not expend any money in securing the landing places; that would be done by the companies. There is in contemplation the organization of private corporations which will shortly approach the Government for subsidies for the carrying on of a mail service between different points in Canada. It was necessary that we should have this legislation in order that private companies might be in a position to approach the Government for assistance to carry on public services or to conduct any form of commercial aeronautics themselves.

Mr. COPP: I quite agree with the minister that such legislation should be passed at this session. Aeronautics are only in the experimental stage and it is but right that opportunities should be given to develop this service if it becomes of commercial value to the country. I would suggest, however, that we surround it with adequate safeguards, particularly in connection with the expenditure of moneys. I fear that if money is expended without the approval of the Governor in Council a very much larger expenditure will be incurred than the Government or this Committee foresees at this moment.

Mr. A. K. MACLEAN: The Governor in Council will exercise a very critical control of expenditures. Clause 7 of the Bill reads:.,  
All salaries mentioned herein and ail expenses  
incurred under the provisions of this  
Act shall be paid out of such money as may  
be appropriated by Parliament therefor.

The authority of Parliament must therefore be obtained before any money can be expended.

Mr. LEMIEUX: If it is good in this case, why not in the railway case? My hon. friend says that companies are already petitioning the Government to establish aerial mail services, and he gives us a gentle hint that the Government may favourably consider the request made by these companies. He has mentioned possible routes  
-Halifax and Sydney-

Mr. A. K. MACLEAN: The Magdalen Islands.

Mr. LEMIEUX: My 'hon. friend has struck the nail on the head. The Magdalen Islands are the only group of islands inaccessible during several months of the year.

Navigation closes at the beginning of January and is hardly open on the first of May, and it would be highly beneficial if a mail service could be carried on during the winter months between, say, Pictou and Prince Edward Island, and the Magdalen Islands.

Mr. A. K. MACLEAN: I have no doubt that mail will receive the attention of the Air Board. They would have to study very carefully the atmospheric conditions, the effect of altitudes, etc., before it could be definitely decided how practical these questions are. But when one is thinking of the practical uses to which aeronautics may be applied in Canada in public services, one immediately thinks of Newfoundland, Prince Edward Island, the Magdalen Islands, the Yukon Territory, across lake Superior, James Bay and many other routes.

Mr. LEMIEUX: And the cruising of our forests.

Mr. A. K. MACLEAN: Yes, the cruising of our forests.

Mr. LEMIEUX: The Conservation Commission is very anxious that such a service should be established, and I note with pleasure that the province of Quebec has secured two aeroplanes to cruise the forests there.

Major-General MEWBURN: They can also be used for photographic purposes in the making of surveys.

Mr. LEMIEUX: Yes. The great enemy at present is fire, and according to statistics published lately the losses are colossal. I see in the establishment of an aerial service a great boon for Canada not only in the matter of defence but commercially and industrially.

Mr. J. H. SINCLAIR: I see in the American papers that the United States Government have been experimenting in the locating of schools of mackerel by aeroplane. Possibly aeroplanes might be useful in that direction.

Mr. A. K. MACLEAN: I have seen that in the papers but I do not think that any experiments in that direction have been really made. I know of something analogous to that, though. The seal fishermen in Newfoundland were endeavouring some

months ago to secure the services of an aviator-I do not know whether they succeeded or not-to fly out over the ice floes to ascertain the location of the seals and the openings for sealing vessels and steamers. That is easy of accomplishment if atmospheric conditions permit.

Mr. J. H. SINCLAIR: You can see deeper into the water from above, and schools of mackerel can be located in that way. By this section the Departments of Militia and Naval Affairs are associated with this Board. Which department will it come under?

Mr. A. K. MACLEAN: Both.

Mr. J. H. SINCLAIR: What minister will be responsible for the administration of this board?

Major-General MEWBURN: That is not settled. There will be a representative of the Militia Department on the board.

Mr. ALFRED THOMPSON: Is the minister in a position to make a statement as to what development has occurred in regard to coastal patrol by seaplanes which will operate under this board? Some time ago

I took the opportunity of expressing some ideas I had in regard to the development of the hinterland of Canada by the use of aeroplanes,

and I am delighted now that this minister has brought in this Bill. I feel, with the hon. member for Maisonneuve (Mr. Lemieux), and other hon. gentlemen who have spoken, that we are on the eve of great events in so far as aerial transport is concerned.

On another occasion when I was addressing the House, I pointed out that we had a tract of land 1,600 miles long and 1,000 miles deep just north from here where aeroplanes could be used for exploration purposes and for the carrying of scientists, geologists, naturalists, topographers and photographers, in order that the country might be properly mapped and explored. I also pointed out that the geologists have told us that the Cobalt and Porcupine formations in Northern Ontario extend northward.

There is a great field for the use of aeroplanes in a scientific way. But, what I particularly desired to bring to the attention of the Committee was an accident that occurred on the west coast of this continent last fall when a steamer was on the rocks of the Lynn canal, and when 343 people were drowned, not one person being saved. A great work could be done on the coast in aiding shipping in bad weather by the use of aeroplanes, and I would be glad if the minister could say as to whether the plans

of the Government contemplate a service of that kind more particularly on the Pacific coast and in British Columbia.

Mr. A. K. MACLEAN: The service to which my hon. friend (Mr. A. Thompson) refers is one of the many that it is intended shall come within the purview of the board. Just how practical a service the aeroplane might render on the coast is one which, of course, will have to be determined by experience. But at least I can inform my hon. friend that that is one of the subjects which will have the attention of the board when it is established.

Mr. MOWAT: With regard to clause 3, which with clause 4 is the chief operating clause of the Act, I would say that the draughtsman has done his work well, but there is one thing that he has not had present in his mind in connection with the matter and that is as to the question how aeronautics is going to interfere with the property rights of the public. I would suggest to the minister that he consider that point before the Bill goes through. According to the law, as it has stood for many hundreds of years, the right of the property owner extends usque ad caelum ab inferno, that is up to the heavens and down beneath the earth. That is his property. It may be that we have arrived at a stage in the world's history in which a machine has come which will suddenly be launched across his property. While a flier may be far up in the air and could not be said to do very much harm to a man's property, sometimes aeroplanes come very near to a man's house and they do make a great deal of noise. You may have claims made by certain property owners who do not want these things coming over their houses or property. There is nothing in the Act which enables the Government to say that aeroplanes shall have the right to pass over a man's property or to define the conditions under which that right shall be exercised. I do not share with the minister the doubt that he seems to have as to his power to enact this legislation as having reference to the point raised by my hon. friend from Kamouraska (Mr. Lapointe).

Mr. A. K. MACLEAN: As to provincial service only.

Mr. MOWAT: Quite so. Property rights will be provincial. You have the right to legislate with regard to that because you have the exhaustive clause of the British North America Act which says that anything which is not provincial is Dominion.

You have besides that, the Post Office service, the naval service, and the military service, and, last, but not least, the service suggested by the hon. member for Yukon (Mr. A. Thompson)-the geological service. That brings it into the Interior Department. With all these uses in the different departments of the Government to which the aeroplane might be put, there seems to me to be a preponderating case in support of the contention that these are Dominion matters and would naturally come under the control of the Dominion authorities. How could an air man know where the exact position of the provincial boundary was? When he starts out on his journey he must have some rule or regulation which will carry him to the end of it in Canada without regard to what particular province in Canada he may be in. I doubt if any one will raise the point that this is a matter for exclusive provincial jurisdiction. If any one does, it behooves the Dominion Government to fight for Dominion rights with all the power they have. I agree that it is a good general purpose Bill. It is impossible to foresee all the things that will come under it but its provisions are expressed in general terms and if the minister will consider the addition of a clause which will give the right to go over properly either with or without compensation- I do not care which-he will be making a Bill which will do for the time being and until we know more about the subject. It seems to me that the Bill should pass at this session even if it is not wholly adequate to provide for all cases so that the world may know that Canada, is, as usual, in the van in regard to improvements in science.

Mr. A. K. MACLEAN: As my hon. friend (Mr. Mowat) in closing, referred to the necessity of legislation at this session, I would like to emphasize the statement a little farther and say that I am very anxious to have the Bill become law at once and that I shall probably ask His Excellency's assent to this Bill long before the closing of Parliament. I do not desire to amend the Bill with a view of abrogating any of the common law doctrines in respect to property rights in the air. In view of recent developments, the point is one for the courts to determine but I doubt very much if that doctrine would be held to have much validity under the circumstances. I would refer my hon. friend to paragraph (i) of section 4 which reads as follows:

(i) the institution and enforcement of such

laws, rules and regulations as may be deemed necessary for the safe and proper navigation of aircraft in Canada or within the limits of the territorial waters of Canada;

The subsection 3 immediately below reads as follows:

(3) All regulations enacted under the provisions of this Act shall be published in the Canada Gazette, and, upon being so published,

shall have the same force ~~in~~ law as if they formed part of this Act.

The important thing to have in mind in aerial navigation is the protection of life and property, and I have no doubt the board will provide by regulation that no flying machine shall approach the ground, or approach a building, within a certain number of feet. I have heard the story frequently, and I assume it is a fact, of somebody when flying in the city of Vancouver entering a bedroom where a patient was being attended by a doctor; the machine and pilot landing in the bedroom. We will seek to avoid the repetition of such a discourteous act as that by providing a regulation that the flight of the airplane shall be of a certain height in order to safeguard, so far as is possible, the safety of property and person. I submitted the Bill to the Justice Department before introducing it, and was told that the measure was perfectly constitutional and about the best that could be done to meet the situation for the time being.

Mr. CRONYN: I rise to support the suggestion of the hon. member for Maisonneuve (Mr. Lemieux) that this is a good opportunity to really consider Government ownership in connection with aeronautics, and I bring the point up under subsection (11) of the clause under discussion. I would urge upon the minister, when preparing the regulations considered necessary for the control or operation of aeronautics in Canada, to make those regulations so drastic for the time being that the Government will be able to keep that control within its own hands. I think one of the tests to be brought to bear on the question of public ownership is whether the particular business under consideration has become, or is likely to become, a natural monopoly; and while it is impossible for us to foresee, as was instanced in the case of the Bell Telephone Company, to what extent aeronautics may become a monopoly, there is some danger of it. Some months ago I overheard a discussion in New York about the formation of a wealthy syndicate to acquire the landing places around the great cities in the United States, and thus to completely control aeronautic operations,

or aviation between those points. It is evident that unless an aeroplane can come close to the heart of a city to make a landing its speed avails little, because the time consumed after the landing is made to reach that centre, takes so much off the time gained between cities that the aeroplane comes then into competition with the railway. I might also be permitted to point out to the minister that Mr. Rudyard Kipling, many years ago, drafted a code of aeronautics. Following his wonderful tale which, I think, is called "The Night Mail," he set as a matter of tour de force of the imagination, prepared a series of rules. I have not read them for many years, but in those rules Mr. Kipling covers some of the very points we have been considering this afternoon.

Mr. McXENZIE: I think it is only fair when we are dealing with so practical a phase of the development of aeronautics as the present, that I should suggest to the minister that he would in connection with this board and in connection with any legislation on this subject enlist the sympathy and help of the father of aeronautics in this country, I refer to Dr. Bell, who has a home at Baddeck, N.S., although he sometimes resides in Washington. I had the pleasure in September 1896 of being present in the machine shop experimenting office of Dr. Bell in the town of Baddeck, when it was considered a great achievement in aeronautics that he could cause a certain machine that he had in his laboratory to rise three or four inches from the ground. It is gratifying to know that we have today reached such an advanced stage of development in aeronautical science. Dr. Bell is a Canadian, born in Brantford in the great province of Ontario and is well known, and he spends about ninety per cent of his time at his beautiful home in the neighbourhood of Baddeck in the county which I have the honour to represent, and I think it would be only fair on the part of the Government to recognize his great services, the great research he has displayed, and what he has done for this science. The first airship that was ever built in Canada was constructed at his workshops at Baddeck, and did considerable flying. It was operated by a Baddeck boy, young McCurdy, who was famous afterwards as a flier and who was in charge of some of the works at Toronto or Camp Borden in the early stages of the war. I do not know where young

McCurdy is now.

Major-General MEWBURN: Long Branch.

Mr. McKENZIE: He is the young man who took charge of the first flying machine that was built in Canada, if not on the continent of America, under the direction of Dr. Bell. He was assisted by another young Canadian, also well-known to fame—or at least his progenitors were, young Baldwin, the grandson of the famous Canadian statesman of that name. Mr. Baldwin is in charge of Dr. Bell's works at Baie d'Uxville, where not only flying machines, but machinery of the most advanced type in connection with transportation, are turned out. I therefore suggest to the minister that it would be a proper and well-deserved compliment, and a mark of recognition on the part of the Canadian people and Canadian Government, to Dr. Bell to enlist his sympathy and utilize as much as possible his great knowledge in connection with the enterprise in which Dominion authorities are now about to engage. As to landing places, if it is desired to take advantage of possibly the greatest site in the world, let me point out to the minister that his own native town of North Sydney is the place that was selected by both the United States and Canadian Governments while the war was on, and when they were looking for the very best location for the starting of an aerial service. At that time North Sydney was chosen as the best place on the east coast of America for the purpose.

A large amount of money has been expended on the station there, and very extensive buildings erected which are now owned by the Government. Large areas of land were also acquired for the purpose of carrying on experiments, and I would suggest to the minister that the board to be appointed under this Bill are the proper persons to take charge of that property and see that it is not lightly thrown away.

There is an idea that a portion of this land is to revert back to some of its original owners, and if that should turn out to be the case the Government may not again acquire it as cheaply as they did in the first instance.

Those works were constructed, at the nearest point to Newfoundland, and there at least forty or fifty machines were built and put in operation last summer.

We got so used to flying machines last summer in North Sydney that it was no more a novelty to see an aeroplane in the air than an automobile on the street. I am bringing these matters to the attention of the minister so that he may not forget to make use of the knowledge and experience

of those great men who are to all intents  
and purposes Canadians, and of the development  
that has already taken place in  
connection with the use of aeroplanes and  
hydroplanes for commercial purposes.

Mr. A. K. MACLEAN: The property at  
Sydney will, of course, under this Bill, come  
within the control of the board, and it is  
not the intention of the Government, so far  
as I know, to part with it. I quite agree  
with my hon. friend (Mr. McKenzie) that  
it is a very desirable property, particularly  
in connection with trans-Atlantic opera- tions. I am also grateful to him for calling  
the attention of the Government to the  
pioneer work of Prof. Graham Bell. His  
very valuable services in the science of  
aeronautics ought to receive proper recognition,  
and I shall be very glad to submit  
to my colleagues the suggestion of my hon.  
friend.

Mr. SUTHERLAND: The clause now before  
the Committee affords a good deal of scope  
for the imagination of hon. members in  
defining the duties of the Air Board. When  
we contemplate the great strides that have  
been made in the science of aeronautics  
during the last five years and the possibilities  
of the future, I think we may well  
realize that this is likely to become a very important service. I do not feel very much  
concerned about the danger of not having  
sufficient landing places. If there is one  
thing we may claim to have in abundance  
it is sufficient room for that purpose.

The question raised by the hon. members  
for Kamouraska (Mr. Lapointe) and other  
hon. members is, I suppose, a constitutional  
one, but to the ordinary layman it  
seems inconceivable that any province  
should claim a monopoly of the air. This  
is a case where provincialism should not  
creep in, and certainly it ought to be within  
the jurisdiction of the Federal Government.  
It seems to me that the Government have  
shown good judgment in promptly bringing  
a measure of this kind before Parliament.  
No doubt the Air Board will keep in touch  
with changing conditions and report to  
the Government from time to time, and  
I think this section should be made as  
broad as possible in order to give the Board  
the fullest control of the air service. But with  
regard to the disposal of certain machines  
which were in service during the war, those  
machines might be all right for training purposes,  
but a very different type of machine  
will be needed for commercial purposes.  
I do not altogether agree with the view  
that the Government should exercise too

## Notes on "Civil Aviation"

rigid a control over the service. I think something should be left to the ingenuity or individual initiative if this service is to develop as we would like to see it develop. Our Canadian boys made an enviable record in the air at the front, and the Government would certainly be lacking in their duty if they failed to retain in our air service as many as possible of those splendid men who made such brilliant records overseas.

When we consider the 5 p.m. immense undeveloped resources of this country, and what can be accomplished through such an air service I think it is very important that instead of restricting the powers of this board we should extend them as far as possible. Practically the whole northern part of Canada is unexplored, and we have as yet no idea as to the value of our resources in that vast territory. This service can render very valuable work in the way of exploration and fire protection.

Mr. TOLMIE: I think the Government is to be congratulated on taking this progressive movement and in recognizing the splendid work done by our air men at the front.

In a country like British Columbia this service can be very usefully developed in connection with the handling of forest fires, and also in exploration work.

But I hope one of the first things to be taken up by this Board will be to thoroughly investigate the possibilities of using the service for rescuing shipwrecked people. We have had many serious wrecks on the Pacific coast, some of them almost within a stone's throw of shore, such as the Princes Sophia recently, and the Valencia wreck on the coast of Vancouver Island a few years ago. The latter boat was within a few hundred yards of the shore, but owing to the shallow water and the steep cliffs it was an utter impossibility to rescue the passengers, and they dropped off the rigging one by one and only a few were saved. In such cases an aeroplane could render valuable help by carrying a cable to the ship by means of which those on board might be brought safely to shore. I trust this will be one of the first things investigated by the Air Board.

Section agreed to.

On section 4-powers of Air Board to make regulations with approval of Governor in Council.

Mr. McKENZIE: In the matter of penalizing a person who violates the rules, has the minister given attention to the question of jurisdiction? Where will the offender be tried and the penalty be imposed?

Mr. A. K. MACLEAN: Such a case would be comparable, I suppose, to a case against an offender engaged upon a ship; he would first be served by a process at the court.

Mr. LEMIEUX: How about the customs laws?

Mr. A. K. MACLEAN: Section 5 provides that the board shall have power to control the places in Canada where a landing may be made from a foreign country.

Section agreed to.

On section 5-officers and men:

## Notes on "Civil Aviation"

Mr. A. K. MACLEAN: The purpose of this clause is to provide for the control and discipline of those employed in connection with the Government service. For instance, if it was an air service in connection with national defence, the Air Board would acquire these powers, which are somewhat similar to the powers enjoyed by the Naval Department and the Militia Department. If the service had something to do with policing the unorganized territories in Canada, it would probably be necessary to house and clothe our men - The powers are very general, but important and necessary.  
Section agreed to.

On section 7-payment of expenses, etc., under the Act.

Mr. BELAND: Is it contemplated to have a certain number of aeroplanes reserved for the exclusive use of ministers of the Crown? It would mean a great saving in time-and time is precious just now, as is evidenced by the fact that we are interfering with the ordinary course of the sun to gain some of it. To have some aeroplanes reserved for ministers would afford them an opportunity, when they travel in that way, to see very much more of the country which they govern. Further, it would avoid the repetition of the fearful plight in which my hon. friend (Mr. McCoig) found himself at the station in Toronto the other day, when he was unable to get a sleeper because of the fact that three private cars were attached to the Ottawa train.

Major-General MEWBURN: You would not want to see the ministers any more up in the air than they are now, would you?  
Section agreed to.  
Bill reported.

### 07 May 1919 - THE CANADIAN AIR BOARD.

In the Dominion House of Commons the Government Bill creating an Air Board to - control aeronautics in Canada was read for the first time. A Minister of the Crown will preside over the Board, on which will be represented the Departments of Militia and Naval Service. Authority will be given to the Board to make the necessary regulations to undertake technical research and to grant licences to pilots and for commercial services.

8 May 1919 - THE CANADIAN AIR BOARD BILL (Bill 80) "An ACT to authorise the creation of an Air Board for the control of aeronautics" read for the 1st time by Hon. Sir James Loughheed.

### 13 May 1919 : AIR BOARD BILL.

#### SZCOND READING.

Hon. Sir JAMES LOUGHEED moved the second reading of Bill 80, an Act to authorize the appointment of an Air Board for the control of Aeronautics.

He said: Honourable gentlemen, the purpose of this Bill is, as indicated by its title, the control of aeronautics by the Government. Up to the present time, in our legislation, we have been regulating human endeavours and human activities both on land and sea; but a new sphere of human endeavour has opened up, namely, the air, and it has become important that the Government should determine the control and regulation of aeronautics. It is quite manifest to honourable gentlemen that at an

early day the airship must necessarily become a very important factor in the activities of commercial, military, and naval life within the boundaries of the Dominion. It will doubtless shortly be used for postal purposes and for the prevention of fire in forests and timber areas, as well as for purposes of defence, both by land and sea. There will have to be routes of transportation determined. This can be done only by a central authority, namely, the Government of Canada. Of course, very nice questions may arise as to the authority of the Dominion Government over the provinces in the working out of this matter. It is a subject that, of course, was not under contemplation and could not have been foreseen at the time of the passage of the British North America Act. It may possibly yet require some amendment to that Act to determine with whom the authority lies in matters connected with aeronautics. I think honourable gentlemen will agree with me that it is desirable that this very important subject should be controlled exclusively by the central Government.

Hon. Mr. CASGRAIN: Certainly.

Hon. Sir JAMES LOUGHEED: It is therefore "with a view to the working out of all those problems that this Air Board, is being formed. It will be seen from a perusal of the Bill that one of the members of this board will be a minister of the Crown, and that the Department of Militia and likewise the Naval Department will be represented on the board. I think it probable, therefore, that the board will include two members outside of those departments; but so many problems will have to be investigated as to render it desirable that there should have a fairly large board. The members are to be appointed for three years, and doubtless by the expiration of that time the subject will be very much defined and much more developed than it is today. Such are the objects of the Bill which is now before us.

Hon. HIEWITT BOSTOCK: Honourable gentlemen, I think that the policy of the Government in bringing down this Bill is adopted rather late in the day. If any criticism is to be made of the action of the Government in this matter, it is that action of this kind should have been taken before now, because at the time the Imperial Munitions Board was winding up its war work, it disposed of a great deal of plant which it might have been advisable for the Government to take over, taking advantage

of the prices at which that plant was disposed of. The departments that will have charge of the air service would, of course, have been able to make a very advantageous bargain in taking over a great portion of the plant that was at that time at Camp Borden.

The object of the Bill, as I understand from my honourable friend, is more to regulate the activities of the companies and of the Government themselves in regard to aeronautics. At the present time no very active policy is to be adopted in the way of establishing a service of dirigibles or aeroplanes in connection with any of the departments. I would, however, point out to the honourable gentleman that the Naval Department should, at any rate, have as soon as possible a service of hydroplanes, for the purpose of dealing with wrecks on the coast. In British Columbia last year we had a case in which it would have been quite possible, had there been a hydroplane service on the coast, to prevent a great loss of life. I would take this opportunity of urging upon the Government the desirability of considering that matter at as early a date as possible.

Hon. J. P. B. CASGRAIN: The Government is, I am sure, to be congratulated upon bringing in a Bill of this sort. It was only the other day that we had here a deputation, which I attended as vice-president of the Aerial League of the British Empire, Canadian section, to ask the Government to lend to a certain association which, I think, is called the St. Maurice Lumber Protection Association, two hydroplanes in order to protect some twenty square miles of valuable timber limits—the most valuable, I suppose, that exist anywhere in Canada. The Government agreed; but I may say they attached very stringent conditions: they wanted this association to assume the responsibility for the total cost of those hydroplanes. They cost some \$40,000 apiece, making a total of \$80,000. However, the association agreed and signed, but I think that they regarded the agreement only as a scrap of paper, because it is not very likely that they would be willing to pay \$80,000 for the experiment. When the experiment has been conducted for some time, the Government will be in a position to know whether the hydroplanes are suitable for this work or not. That vast area of 20,000 square miles is all covered with a network of telephones, wireless, and observation towers for fire protection. The idea is that the hydroplanes will be able to

go from place to place and when they discover fire to report immediately by wireless to the telephone station, which would in turn report, and a man would proceed at once to the place where the fire is and try to extinguish it.

As to returning the hydroplanes in good order, I think the Government is a little too exacting. In the first place, the aeroplanes, after a year's service, might be absolutely useless, fit only for scrap. It is very doubtful if they could continue flying for a year without coming down on some pine trees or spruce trees and getting demolished.

I suppose the association will have to throw itself on the good will of the Government.

The honourable leader of the Government suggests that the provinces may have something to say about the matter. Well, if this is a work for the general advantage of Canada, if we are to build stations and hangars and aerodromes throughout the various provinces, and if at present railway stations, railway sidings, and other railway work can be built, surely this new work can be done without interference from the provinces.

Of course this is not the time to discuss the details; but when they are before us for consideration I think we shall find that the best things, especially for looking after timber limits, are not aeroplanes, which necessitate landing stations, that are not easily to be found. If anything goes wrong with an aeroplane flying over a forest, there may be no place for it to land. Hydroplanes are used on the supposition that the machine may give out when it is over some body of water. If it gives out when flying over the land, the plane is ruined and the aviator loses his life. The latest books on this subject state that dirigibles, that is, lighter-than-air dirigibles, filled with helium, which has a capacity many times greater than hydrogen, will be the most suitable for this purpose. The dirigibles would not have to be very big; there would be only one or two observers; and they would be much safer than aeroplanes, because with the aeroplane, if anything goes wrong with the machinery and it has to come down, it is almost impossible to make a suitable landing. For the landing of an aeroplane you must have a very wide field. You will pardon me if I speak so much about it, because two of my sons are aviators, and I have heard a great deal about it from them. It seems that in order to land you must have a very wide field with a smooth

surface, and the landing must be made at a tremendous speed. The machines travel at the rate of 125 or 130 miles an hour, and it may surprise honourable gentlemen to know that when they touch the ground they are going at the rate of 40 or 45 miles - sometimes 50 miles, an hour; so the slightest obstacle would cause the machine to turn turtle, destroying the machine and killing the aviator. You will therefore readily see that aeroplanes would not be used for scouting work in the forests; it would be necessary to use slower machines, which could land at less speed. Still it would be necessary to have a suitable landing place, and, as we all know, there are no such places in timber limits. However, that is a detail. I think we ought to commend the Government for what it is doing. There is undoubtedly a great future for dirigibles.

Hon. RAOUL DANDURAND: Honourable gentlemen, the honourable leader of the Government has said that there may be some difficulties to adjust with the provinces in the administration of this Act and in the division of powers between the provinces and the Dominion. It seems to me that there are certain services that can be controlled only by the Federal Government.

The Customs Department will need to keep its eyes wide open to see that no contraband comes through the air. By what arrangement will our neighbours carry contraband shall be prevented is a question which I have not studied, but I foresee that the two countries will have to adopt very strict and minute regulations for the landing of those planes.

Hon. Sir JAM-NES LOUGHEED. They may need free trade.

Hon. Mr. DANDURAND: They may bring about free trade, which would be a godsend for the world if we had free trade all round. Yet the provinces may claim that, as they have control over land routes, the air routes should be as free and should also belong to the domain of the provinces. But this is a broad subject which I will not undertake to treat just now. There will be, of course, the question of the relations between the provinces, where the question of customs will not intervene. My only fear, from the news I read in the newspapers yesterday and this morning, is that the province of Quebec, which has limited itself to beer and wine, may be invaded from the air with Ontario whisky.

The motion was agreed to, and the Bill was read the second time.

The Senate adjourned until Tuesday, May 13, at 3 p.m. AIR BOARD BILL.  
CONSIDERED IN COMMITTEE AND REPORTED.

On motion of Hon. Sir James Lougheed, the Senate went into Committee on Bill 80, an Act to authorize the appointment of an Air Board for the control of Aeronautics.  
Hon. Mr. Watson in the Chair.

Section 1 was agreed to.

On section 2-Air Board:

Hon. Mr. BOSTOCK: The gentlemen referred to in section 2 could not be in addition to the other members.

Hon. Sir JAMES LOUGHEED: Oh, no.

Hon. Mr. BOSTOCK.: Then, referring to subsection 5, if these gentlemen are officials of other departments they would not receive salaries in addition to their salaries as officials of those departments.

Hon. Sir JAMES LOUGHEED. I would not think so. Of course, I cannot speak with definiteness at the moment; but it would be unusual if that were the case.

Hon. Mr. BOSTOCK: I think we have had one case at least in the past of an official holding positions in two different departments, and drawing salaries in both.

I think that is objectionable.

Hon. Sir JAMES LOUGHEED: Of course, if that should be done, it will be necessary to have an item placed in the estimates, and there will be an opportunity in the other House of criticising any such step as paying two salaries to one official.

Section 2 was agreed to. On section 3-duties of the Air Board:

Hon. Mr. BOSTOCK: Paragraph c and this section says:

It shall be the duty of the Air Board to—construct and maintain all Government aerodromes and air stations, including all plant, machinery, and buildings necessary for their efficient equipment and upkeep.

Is it the intention of the Government that the Air Board should take all that work into their own hands? The Naval Department, the Militia Department, and possibly the Post Office Department, might be interested in this question of aerial service. The Naval Department and the Militia Department would be doing it more or less for war purposes, and the Post Office Department for commercial purposes.

Would it not be better that they should be able to construct those aerodromes and do that kind of work themselves?

Hon. Sir JAMES LOUGHEED: I think it is very desirable that there should be uniformity and standardization as far as possible, and, furthermore, that all this

work should be supervised by a body that has familiarized itself with the question of aeronautics. My honourable friend will readily see that without delegate to other departments the duty of attending to aeronautics would lead to great confusion. It is desirable that this Board should make a special study of aeronautics during the three years for which it is appointed, with a view to making a practical application of aeronautics to all the public services of the Government. I think the policy is an excellent one.

Hon. -Mr. BOSTOCK: I think the policy laid down by my honourable friend could be maintained if the Air Board had authority. We see that those other departments carried out their instructions. The Board could study the matter and draw up regulations and suggest plans and give other necessary information which the other departments could follow. I do not see that it is necessary for them to go into the actual construction.

Hon. Sir JAMES LOUGHEED: This question necessitates a special study of the features that may be involved in the carrying out of the various problems with which we have to deal; and, if the suggestions of my honourable friend were carried out, it would be necessary to have experts in practically all of those departments.

It is very much better that those experts should be centred in one body, and that they should supervise and carry out the means and methods of transportation by air, and the equipment involved in doing that.

Hon. Mr. BOYER: Would not paragraph i cover the point raised by the honourable the leader of the Opposition? It says: To co-operate with the officers of the Departments of Militia and Defence and of the Naval Service on all questions relating to the air defence of Canada.

And could not the postal service be added?

Hon. Sir JAMES LOUGHEED: Yes. As my honourable friend will clearly see, co-operation and co-ordination between the central body and the various departments is necessary.

Hon. Mr. BOYER: Only two departments are mentioned: Militia and Defence and the Naval Service.

Hon. Sir JAMES LOUGHEED: Of course. Defence involves a very much more extended service than would the commercial feature. Defence, either by land or by sea, is something that requires very

## Notes on "Civil Aviation"

special knowledge of military or naval science.

Section 3 was agreed to.

On section 4--powers of Air Board to make regulations:

Hon. Mr. BOSTOCK: I would ask the honourable leader of the Government, with respect to the making of regulations respecting aerial navigation, what steps do the Government propose to take in dealing with matters in which the interests of the provinces and those of the Dominion might be considered as conflicting? Is it proposed to consult the provinces in regard to such matters?

Hon. Sir JAMES LOUGHEED: I can scarcely anticipate what constitutional difficulties may arise. Clearly, where any service is of an interprovincial character, the authority would be vested in the Dominion Government; but a question might arise as to a service entirely within the boundaries of a province, in which the Dominion Government would be particularly interested--possibly a service that might be established in connection with some object or subject in which the Dominion Government is exclusively interested. What might be the constitutional standing of the Dominion Government in regard to carrying on a service absolutely within the boundaries of the province? I cannot say at the moment. I do not want to anticipate difficulties. As I said the other day, when the British North America Act was passed we could not have expected that science would make such progress that the air would be used for transportation systems. Therefore, in matters of this kind, we shall simply have to allow the future to take care of itself.

Section 4 was agreed to.

Sections 5, 6, and 7 were agreed to.

The title and preamble were agreed to.

The Bill was reported without amendment.

14 May : AIR BOARD BILL.

THIRD READING.

Bill 80, "An Act to authorize the Appointment of an Air Board for the control of Aeronautics."--Hon. Sir James Lougheed. In His Majesty's name. His Excellency the

Governor General doth assent. After which His Excellency the Governor

General was pleased to close the Second

Session of the Thirteenth Parliament of the

Dominion of Canada with the following

Speech: [...] Almost the entire Canadian Expeditionary

Force has now returned to our shores and the

task of demobilization has proceeded with much

greater expedition than was at first believed to

be possible. The work of assisting the returned

men in vocational training and in settling

upon the land has made rapid advances,

## Notes on "Civil Aviation"

and It Is believed that In this respect Canada stands second to no country In the world. The volume of legislation enacted at the present session has been both comprehensive and important. The measures respecting Soldiers' Settlement, Pensions, Combines and Monopolies, Technical Education, Construction and Improvement of Highways, and Public Health are especially noteworthy. Equally important are the Bankruptcy Act, the measures authorizing the establishment of an Air Board for the control of aeronautics and the Act providing for the operation of the Canadian National Railways. I trust that these and other important measures which you have considered and approved will be attended with marked advantage to the public interest.

28 May 1919 :

Aeronautics at London University, London UK : At the meeting of the Senate of London University it was resolved to institute a Chair of Aeronautics tenable at the East London College.

This is in addition to the "Zarahoff Chair of Aviation" at the Imperial College of Science and Technology, London the first appointment to which has still to be made, although the requisite funds were given to the Government nearly two-and-a-half years ago.

Post 1919 : Ernest L. Janney becomes general manager of Canadian Northern Traders

post 1919 : Canadian Northern Traders declares that it plans to use five JN-4 aircraft and an unspecified number of airships to exploit resources in northern Quebec.

Canadian Northern Traders under Janney : A party ascended the Moise River that spring and lose two men [killed / died]. The survivors, paid only in company stock, took jobs elsewhere.

16 October 1919 :

Ernest L. Janney is arrested in Cornwall, Ont. Charged with using a bad cheque to buy a JN-4 (Ottawa Citizen)

January 1921 :

Ernest L. Janney now in Edmonton, announces plans to run an air service from Peace River, Alta., to Fort Norman, Northwest Territories, using dirigibles. The air service never started. Alberta authorities halt trading in "Janney Company" stock.

Ernest L. Janney continues to sell shares in the "Janney Company" until July 1921

1919 :

Oswald Short [Short Bros.] designs an duralumin aircraft [silver streak].

UK-Air Ministry turns down Oswald's concept because of the "unproven" construction material.

01 January 1919 : "Civilian" aviation resumes within Germany.

07 January 1919 : United States Navy Air Stations at Halifax and Sydney paid off.

January 1919 :

US Brigadier General William "Billy" Mitchell is stationed at the American Army of Occupation H.Q. Coblenz, Germany. From this position, Mitchell was ordered back to the United States for duty as the assistant director of US Military Aviation.

## Notes on "Civil Aviation"

07 January 7, 1919 United States gifts to Canada: 12 HS-2Ls, 26 Liberty engines, 4 kite balloons.  
January 1920 : RNAS-C Dartmouth now Canadian Air Board entity: performs civil and military duties.  
. - See more at: <https://legionmagazine.com/en/2016/02/the-first-air-war-at-sea/#sthash.af5DtQi1.dpuf>

1919 : USN donates 12 HS-2L flying boats to Canada.

February 1919 : Compagnie des Messageries Aériennes (CMA) is established in France. CMA later becomes "Air France".

4 February 1919 : US Brigadier General William "Billy" Mitchell dines with Trenchard and Secretary of State for War and Air Winston Churchill. (Andrew Boyle, *Trenchard* (London: Collins, 1962), 328–31; Mitchell, *Daily Journals January–March 1919*, box 4, MP; James C. Cooke, *Billy Mitchell* (Boulder, Colo.: Lynne Rienner, 2002), 107)

05 February 1919 : Deutsche Luft-Reederei (Lufthansa) restarts operations.

08 February 1919 : Lignes Aériennes (Henri) Farman is established.

9 February 1919 :

US Brigadier General William "Billy" Mitchell lunchen with Trenchard. Mitchell left no record of these discussions, but when he left London in mid-February he had become a "full-fledged apostle for an independent air arm" similar to the British model. (Andrew Boyle, *Trenchard* (London: Collins, 1962), 328–31; Mitchell, *Daily Journals January–March 1919*, box 4, MP; James C. Cooke, *Billy Mitchell* (Boulder, Colo.: Lynne Rienner, 2002), 107)

20 February 1919 :

Brigadier General William "Billy" Mitchell sails from Liverpool to New York. With Mitchell was Lieutenant Commander Jerome C. Hunsaker, the U.S. Navy's leading authority on aircraft design.

Hunsaker, was returning home after having served on the Allied Naval Armistice Commission, which had been investigating German naval aviation while securing the surrender of German aircraft.

Hunsaker had prepared more than 90 reports on British, French, and Italian aviation as well.

The two men should have had a common bond, but "Hunsaker took an immediate personal dislike to Mitchell, whom he regarded as a masterful 'politician in uniform,' 'charming' in some ways but with a certain 'asinine quality.'"

Mitchell expounded to anyone within earshot on the lessons of the war and the importance of an independent air force.

The general and his cohorts, Hunsaker recalled, were "fully prepared with evidence, plans, data, propaganda posters, and articles to break things wide open for air power as the sole requisite of the national defense in the future.

February 1919 :

United States : The U.S Army was licensing domestic aviation under wartime [53] emergency legislation.

Surplus military aircraft in the United States were being put on the open market with virtually no control over how and where they might operate. Aviation anarchy loomed.

An editorial in the U.S Army and Navy Journal for 25 June 192 said that "in both services, Borah's bill (S.J.R. 77) was generally credited to the advocates of the united air service plan with the idea of keeping it alive in the face of the general position to uniting the air services manifested in Congress, and particularly in the Senate:

There is no satisfactory secondary treatment of the British experience, The reasoning behind the change in the pre World War I system is presented in Great Britain, Air Ministry, Committee on Education and Research in Aeronautics, Report, presented to Parliament 12 Dec, 1919 (London, 1920).

## Notes on "Civil Aviation"

The results can be traced in *Aeronautics: Report of the Advisory Committee for Aeronautics for the Year 1919-20* (London, 1921), and *Aeronautics: Report of the Aeronautical, Research Committee for the Year 1920-21* (London, 1921).

03 March 1919 : Eddie Hubbard and William Boeing carry 60 "Air-Mail" letters from Vancouver, British Columbia, Canada, to Seattle, Washington, USA  
William Boeing (Boeing Model #5, "C" Trainer)  
Pacific Aero Products C-700 Float-Plane. Designed by company engineer Wong Tsu (Masters in Aeronautical Engineering, M.I.T) Wong Tsu, only 56 Model "C" were built. C-700 was modified to "CL-4S".

13 March 1919 : Wallace Turnbull Files patent application for a propeller with variable pitch blades.

22 March 1919 : Lignes Aériennes Farman operates the 1st "Official" international passenger carrying flight between European capital cities using a Farman F.60 "Goliath" piloted by Henri Farman between Toussus-le-Noble in France to RAF station Kenley in London England carrying 11 military personnel.

25 March 1919 : No. 1 Wing C.A.F formed to administer No. 1 & 2 Sqn's C.A.F

25 March - 1 April : No. 1 & 2 Sqn C.A.F move to Shoreham-by-Sea, England.

31 March 1919 : Winston Churchill persuades Trenchard to take up the post of Chief of Air Staff. Churchill / Trenchard angers the Army Council by creating new officer ranks in the RAF. (including the "Engineer"!)

Trenchard founds the RAF's officer training college at Cranwell.

1922 : RAF Staff College created by Trenchard at Andover to train RAF's middle ranking officers.

Trenchard absorbed the Royal Naval Air Service into the RAF – much to the anger of the First Sea Lord, Admiral Beatty.

In the 1920's the RAF was used throughout the British Empire and it was expected that officers in the RAF would do a five-year stint abroad at some time in their career.

1925 Trenchard founds the University Air Squadron scheme: Oxford, Cambridge and London universities. introduces the RAF to three major universities.

1 April 1919 No. 1 Wing CAF assume administration duties.

23 April 1919 : The *North Sea Aerial Navigation Company* begins "passenger" service between Leeds and Hounslow using ex-RAF Blackburn RT.1 aircraft.

Between April 1919 and January 1920 : **Canadian government decides not to retain a permanent peace-time air force**

29 April 1919 : UK Government (Churchill) issues ANR.

- A. ANR bridges United Kingdom "Service" aviation into "Civilian" aviation.
- B. Regulations ultimately prescribe Quality requirements for Workers, materials and final product.
- C. 1919 UK ANR recognises individuals responsible for ensuring aircraft are "Fit to fly" (Engineers)
- D. 1919 UK ANR recognises individuals responsible for ensuring aircraft are safely operated in the air (Pilots)
- E. 1919 UK ANR introduces concepts for "initial and continuing airworthiness" to the civilian world.

## Notes on "Civil Aviation"

- F. Civil aviation operators / operations begin by using modified versions of redundant wartime aircraft designed to the structural strength and stability standards of the RE/RFC which evolved during the war.
- G. Civilian aircraft designed to Civil aircraft airworthiness requirements based upon the RE/RFC/A.I.D standards soon follow.

1919-1920 : UK Air Ministry : The AID "approved firms" system of "delegated inspection" begins. Delegated inspection: Evolution / development of the selective inspection system used by A.I.D during the war.

Private manufacturing and maintenance firms approved (1920) to inspect material on behalf of AID

Subsequently adopted for other "Inspection" roles within the aviation industry.

A.I.D's "delegated inspection" system:

- a) utilizes the specialized experience and skill of contractors' own inspection staff's and
- b) avoids a great deal of duplicated inspection,
- c) saves manpower hours of the Air Ministry's own official inspection staff.

Copied by numerous other countries Civil Aviation Authorities' inspection organizations.

1919 to 1944 : UK Air Ministry has responsibility for both service (Military) and civil (Civilian) aviation in Britain.

1 May 1919, he directed Assistant Secretary of War Benedict C. Crowell to form a commission to study aviation problems as they had developed in the principal Allied countries during the war. Baker made sure to instruct his independent-minded assistant "to limit himself to fact-finding and submit no conclusions as to air policy." <sup>21</sup> During the late spring and summer, the Crowell Commission—also known as the American Aviation Mission—visited France, Italy, and England to confer with various government officials, army and navy commanders, and aircraft manufacturers. the American Aviation Mission returned to the United States in July 1919, its members had concluded that something drastic had to be done to avoid the complete disappearance of the American aircraft industry. It recommended that oversight of all air activities of the United States be concentrated within a single department of aeronautics. But Secretary of War Baker, having specifically warned the mission not to intrude into policy, disagreed in his cover letter accompanying the report's release, stating that the group had "in my judgment gone too far." <sup>25</sup> Army, Navy, and civilian aviators faced different problems and needed to be trained separately, he said. (Source ref : Billy Mitchell takes on the Navy - US Naval History Magazine - October 2013 Vol 27 #5 - Thomas Wildenberg)

01 May 1919 : The 1st "Commercial Flight" under the new Civil Aviation Regulations for the British Empire, a Airco DH.9 bearing RAF registration C6054 operated by Aircraft Transport and Travel en-route from Hendon to Bournemouth crashes at Portsdown Hill in fog, killing both persons onboard.

11 May 1919 : The "Avro Transport Company" offers Britain's first "scheduled" air service from Manchester.

12 May 1919 : Wilfred Reid "Wop" May (the man that Baron Manfred von Richthofen was chasing when he was shot down and killed) DFC, contracts with the City of Edmonton to rent Curtiss JN4 "Edmonton" to promote flying.

19 May 1919 : "Wop" and brother Court form "May Airplanes Ltd", Edmonton. Mr. Pete Derbyshire - mechanic.

19 May 1919 : Canadian Government decides not to form a permanent peacetime air force, orders all CAF flying operations to cease and all equipment belonging to Canada dismantled and shipped home.

29 May 1919 : UK : British Cabinet approves "the gift" proposal to donate surplus aircraft to the Colonies.

29 May 1919 : 22,812 Canadian military personnel had served in the Royal Flying Corps (RFC), Royal Naval Air Service (RNAS) and RAF

30 May 1919 : Canada : Cabinet (Ottawa) rules that "Canada does not need and can not afford a post-war air force", disbands the CAF. However, with the formation of the Air Board - Canada's first governing body for aviation with both civil and military functions - a crack opened for a new CAF to be organized, first on paper and then as a part-time reserve - See more at: <https://legionmagazine.com/en/2015/06/canadian-flyers-go-to-war/#sthash.Nujh0vay.dpuf>

4 June 1919 - the UK government donates to Dominion and commonwealth nations Canada to about \$5,000,000 of equipment, including 80 aeroplanes and 14 flying-boats crated?

## Notes on "Civil Aviation"

06 June 1919 : Air Board Act of Canada 9-10, King George V Chapter II are issued together with the explanatory description of the Air Administration (Canada) & approved by the Chairman of the Air Board. Canadian Government Mandate of the Air Board:

1. To undertake technical Research for the development of Aeronautics, and.
2. Co-operating for that purpose with other institutions".

06 June 1919 : The National Research Council - Canada, to now study aeronautics and aviation safety.

06 June 1919 : Dept of Marine and Fisheries tasked with certificates for Pilots. Dominion Meteorological Service to collect, collate and distribute weather data. Air Board aircraft to take weather data - Temperature / humidity / pressure at various heights across Canada. Government Radio-Telegraph dept (Service) placed in charge of issuing "wireless" qualifications and issue of radio licenses. Board Members - all political appointees - (none know anything about aviation or public safety, but they were connected to those who did):

A.L Sifton, PC, KC - Chariman (one of 2 Canadians who signed the treaty of Versailles)

O.M Biggar, KC - Vice -Chair and JAG

S.C Mewburne, CMG, Minister of the Militia - Air

C.C Ballantyne : Minister of Naval Service

J.A Wilson : Ass't deputy Minister Dept. of Naval Service

E.S Busby : Chief Insp. Customs and Inland revenue

07 June 1919 : "May Airplanes Ltd" (Wop May) pilot George Gorman and Derbyshire deliver newspapers (Edmonton Journal) to Wetaskiwin : 1st commercial flight in western Canada.

07 June 1919 : "Daimler Air Hire" , a "Private" company is established in England by Frank Searle of the BSA Motorcycle Company. Recently of the Ministry of Munitions / head of the British War Mission to the United States in connection with the purchase of machine tools and other engineering products, retired Lieutenant Colonel CB, DSO.

14 June 1919 : John Alcock & Arthur Whitten Brown Depart St. John's Nfld in an attempt to cross the Atlantic "Non-Stop" using a Vickers "Vimy" twin engine bomber.

15 June 1919 : John Alcock & Arthur Whitten Brown crash their Vickers "Vimy" near Clifden, Galway, Ireland.

19 June 1919 : "May Airplanes Ltd" (Gorman and Derbyshire) deliver newspapers (Edmonton Bulletin) to St. Albert : 2nd commercial flight in western Canada.

19 June 1919 : Canadian Government

- A. decides not to form a permanent peacetime air force,
- B. orders all flying operations to cease,
- C. orders all equipment belonging to Canada dismantled and shipped home. (British issued Sopwith Dolphins / S.E. 5a / deHavilland DH 9?)

02 July 1919 : The Aeroplane : .Speaking at the Independent Force, R.A.F., dinner recently General Trenchard stated that a Territorial Force "scheme" (Programme) for the R.A.F. is under consideration. He gave no indication whatever of the lines 011 which the scheme is to be worked, but the natural assumption is that it will be more or less based on the Territorial Force scheme of the Army as organised by the Viscount Haldane. Whatever may be the popular opinion of Lord Haldane, as gathered from the common news-sheets, the indisputable fact remains that his Territorial "scheme" (Programme) was remarkably good, and that it played a very important part in such success as the British Army achieved in this war. Lord Haldane is recognised by experienced officers

of the General Staff as one of the best War Ministers whom this country has had for several generations. It is true that he was weak in his faith in aviation and that the R.F.C. owed him no thanks for anything, but it is none the less a fact that he did much for the British Army, and that it was largely due to him that the little British Expeditionary Force at the beginning of the war was the most efficient army in the world.

**Inducements to Airmen.:** Apart from officers and airman-pilots, a Territorial Air Force offers strong inducements to ex-airmen of the R.A.F. and to ordinary mechanics all over the country, as well as to youths of the higher social classes -who cannot hope to fly owing to physical defects.

One of the greatest harms done to this country in the early days of the war was the calling-up of skilled mechanics who were Territorial soldiers. They went into the line as infantry and were killed in hundreds. Many thousands more joined the Kitchener Annies as privates and were likewise killed, or maimed so as to be unfit for work. Now, if all the former air-mechanics of the R.A.F., and a number of other skilled mechanics from engineering works, garages, and so forth, all over the country, could be induced to join a Territorial Air Force, not only would the R.A.F. be thoroughly adequately manned in time of war, but these particularly valuable men would be saved for the reconstruction of industry after the war. One believes firmly that if all those thousands of gallant and patriotic mechanics and engineers 'who were killed during the first year of the war were still alive, the outlook for British Industry would be far brighter than it is to-day, for they would stand none of the Bolshevist nonsense and treason which is talked in our factories by the trench-dodging scum- who, unhappily, form so large a proportion of our surviving industrial population. A11 additional inducement to mechanics and engineers to join a Territorial Air Force is the fact that they would thus learn a great deal about the construction of aircraft and aero-engines, or—in the case of those who have already worked on aircraft—would keep their knowledge, up to date, and so would be ready to take important jobs in the Aircraft Industry when the great boom in Civil Aviation arrives, as it will do some day—though none can say whether it will be in two, five, fifteen, or twenty-five years' time.

**Inducements to Youths.**

Similarly, youngsters now at school would find it worth their while to join as airmen, because, in case of war, they would automatically drop into their places in the mobilised R.A.F. Those who were fitted for the job would certainly be promoted at once to be technical officers, if they were unfit to become pilots. Many would be taught to fly-. All the rest would be kept at a job at which they were already more or less proficient.

An attempt is being made already in a very small way —as already noted in this paper—to induce youngsters between 14 and 20 }

Tears of age to join a branch of a

London Territorial Battalion and learn something of aeronautical engineering as taught by ex-R.A.F. officers.

This is a step in the right direction—of perhaps one should rather describe it as an attempt at toddling in the right direction—but, obviously, although it has had the official blessing of General Trenchard, it is wrong in principle, as the steps of toddlers generally are.

In the first place, if the R.A.F. is to be the R.A.F. and is not to be a part of the Army', it is quite wrong that aeronautics should be taught under the auspices of a T.F. Battalion of the Army. In the second place, any instruction of this sort, if it is to be given, at all, should be given at an R.A.F. station of some sort—for preference in an aeroplance. shed at an aerodrome among actual aeroplanes. There are plenty to spare at Hendon and Hounslow and elsewhere. Or the classes might be held at the Agricultural Hall or one of the other numerous R.A.F. stores in London itself. However, doubtless this small matter will be put right when a proper cut-and-dried Territorial "scheme" (Programme) is laid down by the Air Ministry.

An Ancient Idea.

.So far one has merely indicated roughly how much easier it will be to induce people to join a Territorial Air Force than it can be to get recruits for the Territorial Army. There are many other inducements, but one has neither the time nor the space in which to set them forth. They may be left to the recruiting offices of the R.A.F. (T.F.) whenever they may be established.

Actually the idea of a Territorial Air Force is far from new. In April and May of 1914 Mr. W. E. de B. Whittaker, now Major, General Staff) wrote a series of articles in this paper on "A Reserve for the Royal Flying Corps" and on "Local Training," setting forth with his customary lucidity and peculiar humour (lie difficultie and also the great possibilities of a Territorial scheme for the R.F.C. As he rightly argued, in those days pilots were so few and far between that there was little possibility of raising the personnel of a squadron in any one town, or of establishing an aerodrome, or of raising the money to buy machines—despite the sporting offer of the city of Liverpool to raise and equip a volunteer squadron.

Many points in his article published on May 7U1, iqi/g might well be of value to-day to those who may be concerned with drafting the new Territorial scheme. And as to the general effect of a Territorial Air Force the end of the said article may well speak for itself :—

" This spreading of aviation (Territorial) into the most curious nooks of the Kingdom, to places where business is the only god, would do much to popularise aviation among the people. Familiarity with flying would teach the populace many lessons both as to the safety of aeroplanes and the instability of aviators. When a man does not understand a thing he invariably dislikes it.

General Trenchard has stated definitely that officers of the R.A.F. will be able to live, and live well, on their pay, so there need be no anxiety on that score. It will be far better to pay a small number of highly efficient

people really well, and to have a large number of volunteers who will be paid nothing at all, than to have a medium number of people all badly paid, all without enthusiasm for their work, and all as inefficient at their jobs as was the average Technical Expert during the war. C. G. G.

Personally one thinks that it might be for the good of the future R.A.F. to do so. Some of the best fighting men (in all the Services and not in the R.A.F. alone) are quite the worst officers and some are far from being gentlemen. A man may be a bully and a cad to his inferiors in rank, and yet be a first-class scrapper. Or a man may be a fine lone-hand fighter and yet hopeless as a patrol leader or an administrator. One of the bravest gentlemen whom one knew in the old R.F.C. was constitutionally unable "to command a corporal"—as a brother officer put it.

In the reorganised R.A.F. the permanent officers must combine all the qualities desirable in an officer and a gentleman. They must have bravery, but they must also have brains. And it is possible that some of the youngsters who will come out of an R.A.F. Sandhurst three or four years hence may combine the two qualities better than some of those who have distinguished themselves as fighting pilots. There is no room in a fighting service for Trade Union principles. Payment by results is the only possible method of securing efficiency. And promotion by merit is only piece-work under another name.

Equal opportunity for all is a perfectly sound theory, but a man must be fit to take his opportunity when it offers. If a proved fighting pilot cannot administer a flight or a squadron properly when he reaches the end of the period of his temporary commission, then he must get out and make way for somebody who can. That is only Nature's law of the survival of the fittest.

Again it is a matter of a man's faith in his own ability. If the proved fighting pilot, with all his war experience of how a squadron ought to be run, and of how men ought to be handled, is not prepared to back himself against the product of an R.A.F. Sandhurst, then the sooner he gets out of the Air Force the better for himself and everybody else.

#### THE RE-ORGANISATION OF THE R.A.F.

The following letter has been received :

—

Sir,—In reply to a letter signed "Audax" in your issue of June 25th, it seems to me that there is something to be said for General Trenchard's "scheme" (Programme) for asking officers to accept temporary commissions. "Audax" complains that a temporary commission of this kind would lead one who accepted it merely into a "blind alley." I suggest that there are many who would be prepared to serve for a total of four years ; one year of which would be occupied in training, while during the other three years the officer will be in all respects on the same footing as regards

## Notes on "Civil Aviation"

pay, disablement pension, etc., as the regular R.A.F. officer.

After four years he will get a gratuity of £ 300, and will have under the C. A. S.'s "scheme" (Programme) a first-class technical education at the expense of the Government. As is well known, the range of technical subjects in the Air Force is a very wide one, and a

- special feature is to be made of educating holders of temporary commissions in the future.

"Audax" should remember also that the work in the future R.A.F. will not be anything like as exacting as the war flying in the past, and will leave therefore more time and more opportunities for specialising in one of the many branches referred to above.

With regard to this second question in which he asks "why fighting pilots should be chucked out of the Service to make room for officers trained in an R.A.F. Sandhurst?" it seems to have escaped his notice that, even if all pilots in the Service on November nth, 1918, were retained, this supply would not last for ever, and that it would still be necessary to legislate for the future supply. This is what Sir Hugh Trenchard is attempting with his "scheme" (Programme) for an R.A.F. Cadet School. In his last paragraph "Audax" states that he considers a Territorial Air Force to be a sound idea. It is, I believe, the intention of the C.A.S. that officers who have held temporary commissions should form this Territorial or Special Reserve Force, and I hope very much that "Audax" is right when he says that it will attract the best of the proved fighting and civilian pilots. I myself predict a great future for a reserve force composed of officers with three or four years' experience either with the R.A.F. in the field in the past or with the Regular Air Force in the future, and consider that such a force must be more efficient than one run purely on the lines of the Army Territorial Scheme, in which an officer need have only a month's preliminary training combined with a certain number of parades in addition to the ordinary fortnight's training in each year. signed : Aileron.

July 1919, British rigid airship, the R.34, became the first flying machine ever to cross the Atlantic from east to west, between England and the U.S., and the first to make a round trip between England and North America

19 July 1919 : Air Accident : Portage la Prairie, Manitoba. aircraft type: 2 seat Thomas LFW made by Thomas-Morse A.C Corp, NY USA.

Lt. S.P Kerr - injured, Lt. W.R Cross - Killed, Mrs. S.P Kerr - Killed. Cause of accident : Stalled close to ground after engine failure. No court of inquiry, no on-site accident investigation by Air Board. No notes on 3 persons in 2 person aircraft.

23 July : ottawa canada : CIVIL SERVICE COMMISSION OF CANADA. POSITIONS VACANT.

THE Civil Service Commission of Canada hereby gives public notice that applications will be received from persons qualified to fill the following positions under the Air Board, the tenure of office to be for three years, renewable :

A Superintendent of Flying Operations, Salary \$4,500 and up.

1. A Superintendent of Flying Operations under the Air Board, at an initial salary of \$4,500 per annum ;
  1. to have charge, under executive direction, of the Flying Operations Branch of the Air Board ;
  2. to organize and direct such flying operations as may be undertaken by the Government of Canada ;
  3. to have charge of Government supply depots ;
  4. to advise as to the proper types of machines for various kinds of Government duty ;
  5. to be responsible for the purchase and storage of Government machines and equipment ;
  6. to supervise their proper up-keep and repair : and
  7. to perform other related work as required.

Candidates should have :

education equivalent to university graduation :

at least two years of flying experience in a British Air Force ;

## Notes on "Civil Aviation"

wide experience of flying various types of flying machines ;  
knowledge of numerous types of flying machines and of the theory of flying ;  
ability to select the proper type of machine for given operations ; and  
ability to organize and administer flying undertakings.

Candidates must be able and willing to fly.

A Superintendent of Certificate Branch, \$3,600 and Up.

2. A Superintendent of Certificate Branch for the Air Board, at an initial salary of \$3,600 per annum, to have charge, under executive direction, of the Certificate Branch ;  
to approve air routes and aerodromes;  
to supervise the examination and to approve of flying machines for airworthiness ;  
to supervise the examination of and the issue of certificates and licences to pilots, navigators and mechanics ; and  
to perform other related work as required.

Candidates should have:

education equivalent to university graduation ;  
at least two years of flying experience in a British Air Force, with  
wide experience in flying all types of flying machines ;  
thorough knowledge of the theory of flight,  
the design of flying machines, and  
principles and practice of aerial navigation,  
the materials entering into the construction of aeroplanes and engines, and  
the rigging and overhauling of all types of machines ;  
administrative and organizing ability.

Candidates must be able and willing to fly,

Secretary, Air Board, Salary \$3,000—\$3,720.

3. A Secretary, Air Board, at an initial salary of \$3,000 per annum, to have charge, under executive direction, of the Secretary's Branch of the Air Board ; to handle correspondence, compile and direct the publication of reports, and generally administer the routine work of the Air Board : to keep records and minutes of proceedings ; to keep in touch with aeronautical improvements, achievements, and literature ; to supervise and direct the acquisition of aeronautical information and its distribution to the members of the Air Board and to other offices ; and to perform other related work as required.

Candidates should have education equivalent to graduation from a university of recognized standing ; at least two years of office experience, one year of which should have been in connection with aeronautics ; a thorough knowledge of the various types of aircraft, and accessories ; and administrative and organizing ability. Candidates must be willing to take the air.

Medical Officer, Air Board, Salary \$2,100 per annum.

4. A Medical Officer for the Air Board,  
at an initial salary of \$2,400 per annum,  
to undertake, under the direction of the Superintendent of the Certificate Branch,  
the medical examination of candidates for and holders of pilots' and navigators' certificates ; and  
to do other related work as required.

Candidates :

should have been graduated from a medical school of recognized standing with  
a Provincial or Dominion license to practice medicine and  
have had medical experience with an Air Force Squadron.

Candidates must be willing to take the air.

General Directions.

Selections for eligible lists of applicants qualified to fill similar vacancies which may occur in future may be made from applications for these positions. Future vacancies will probably include  
an Assistant Secretary ;  
in the Certificates Branch, two Inspectors, one for Pilots and Navigators and one for Aeroplane and Mechanics ; and  
in the Operations Branch, a Flying Officer, and an Equipment and Supply Officer.

According to law, preference is given to returned soldier applicants, possessing the minimum qualifications.

Returned soldiers must furnish a certified copy of their discharge certificates, or in the case of commissioned officers, a certified statement of their military services.

## Notes on "Civil Aviation"

Application forms must be filed in the office of the Civil Service Commission not later than the 21st of August, 1919.  
Such forms may be obtained from the Secretary of the Civil Service Commission, Ottawa, the Vice-Chairman of the Air Board, Ottawa, or the Dominion-Provincial Employment Offices.

By order of the Commission,  
W. FORAN,  
Secretary.  
Ottawa, July 24, 1919. 4-1

1919 : Air Accident #2 - No records held by Gov. No investigation was %.

25 June 1919 : First meeting of the members of the Canadian Air Board. Mandate gets divided into 3 sections - all led by war hero's/ pilots headed by Lt.-Col Robert Leckie DSO, DSC, DFC : Superintendent of Flying Operations - Gov.'t Civil Air Operations Branch.

Lt.-Col. James Stanley Scott, MC, AFC : Superintendent of the Certification Branch / Lic. of aviation personnel / Lic. of Aircraft / Lic. of harbours on land & water. ( WW1 record : only at front for 4 months before invalided to Canada and posted to Camp Borden as Ofcr in charge of training)

Maj. A.M Shook, DSO : Administration of the internal office organization

Unlike the policy in the UK, where a proper and separate "Ministry" was created to govern Civil Aviation" (as a result of the need for the War Office to have a separate office for "AIR"), the Canadian Government gave "responsibility" to the "Air Board" , and they then gave it to the Minister of Militia..

August 1919 : first airplane arrives in Nanaimo, BC

August 1919 : "May Airplanes Ltd" used by detective (Campbell) to track down fugitive in a shooting.

25 August 1919 : Aircraft Transport and Travel (AT&T ) begin regular international service from Hounslow Heath to Le Bourget using war surplus DH.16 aircraft.

25 August 1919 : International Air Traffic Association (IATA) a nonpolitical and autonomous association of airline operators formed "with a view to cooperate to mutual advantage in preparing and organizing international aerial traffic", Hague.

6 companies were represented at the Hague meeting;

2 had commenced operations,

3 others had just been organized and

one was in process of formation.

The idea was to establish unity in the operation of air routes. IATA was to be nonpolitical and its members were to be entirely autonomous.

By 1929 the six original IATA members had been increased to twenty-three, and on the eve of WW2 1939 / 1940 there were thirty members.

05 September 1919 : Aeroplanes equipped with R/T are used to aid whale hunting along coast of Vancouver, BC.

06 September 1919 : Handley Page Transport : Handley Page Type O/400 Ser. No. HP-22 G-EAKE ex RAF J2252 crashes at Volla (Lillestrøm) just after T/O from Kristiania, Norway. Witness reports indicate that a "cog-wheel" in the left engine broke at just 30-40 metres altitude. after coming to rest, 2 passengers bailed out from the nose, while the other five managed to get out by themselves. the nose and parts of the wings are destroyed. repairs were done in the open air, new wings and a new nose were fitted, the work being finished in October 1919.

9 September 1919, the RAF School of Technical Training (Boys) was formed, although it did not take up its new title until 23 December.

In March 1920 the title of the school was changed again, to No 1 School of Technical Training (Boys), Halton.

## Notes on "Civil Aviation"

Trenchard: "We must use every endeavour to eliminate accidents both during training and subsequently." [...] "this end can only be secured by ensuring that the training of our mechanics in the multiplicity of trades [...] is as thorough as it can be made. The best way to do this is to enlist the bulk of our skilled ranks as boys and train them ourselves."81

In the "Boy Mechanic Scheme" (later named the Apprentice Scheme) new apprentices were recruited at the age of sixteen. the great majority of boys come from families who are connected either with one of the services or Engineering trades.

The parents of these boys are themselves well educated and in fairly comfortable circumstances, and look to the future prospects of their sons in selecting a career for them."83

In order to ensure that the most qualified personnel were advanced, Trenchard decided to take the top three apprentices from each culminating term and award them with a cadetship at Cranwell. They would then go on to commission and become leaders within their respective fields.

Although skilled tradesmen were the backbone of the RAF, the War Office had much difficulty determining pay rates for these men. They were essentially lumped in the same category as the non-technical combatants of the army, meaning that pay was relatively standard across the board, which made it difficult to recruit skilled workers.

Therefore, in 1925 the Air Staff argued in favour of each (RAF) "service" (Air / Ground) being allowed to settle its own pay requirements, as long as it was within reason

13 October 1919 : The shipping line "S. Instone & Company" operate a de Havilland DH4A from Hounslow, the first "executive aircraft".

20 October 1919 : Airco DH.4A cabin biplane registered G-EAHG operated by Aircraft Transport and Travel crashes in the English Channel in bad weather.

01 November 1919 : the Royal Air Force College (RAFC) Cranwell was formed, and on 5 February 1920 it was officially opened  
During the initial phases of Cranwell's development Trenchard resolved to abolish the Cranwell entrance exams. Trenchard believed that these examinations did not provide an accurate assessment of the cadet's potential. Trenchard had learned this lesson personally, as he was never the most resolute pupil and rarely received top marks. Trenchard's abilities and leadership manifested in a more practical sense. Prince Albert (later George VI of Britain), among others, advised Trenchard to keep the examination process. Trenchard eventually decided in favor of the examinations on the condition that he had the option to overturn the verdict of the examiners.

06 November 1919 : Flight : the question of scrapping the Air Ministry, and with it the R.A.F. as a separate Service, has been recently discussed, but it is now definitely stated that the idea has been completely dropped, and that the R.A.F. is to continue along the lines of its present organisation. Although, as we have said, we never seriously believed that anything would come of the discussions, it is a relief to be assured that there is an end of them, and we trust most sincerely that they will never be revived again.

General Sykes to Visit Canada and America MAJOR-GENERAL SIR F . H. SYKES, Contoller-General of Civil Aviation, has arranged to visit Canada, the United States, and, if possible, Newfoundland. He expects to leave England in a few days. The visit has been in contemplation for some time, but it had to be postponed until recently on account of the pressure of business relating to civil aviation and the organisation of the Department. Even now i t will not be possible for Gen. Sykes to make anything but a relatively short stay in America and the Dominion. Gen. Sykes's mission relates to the development of international civil flying.

## Notes on "Civil Aviation"

A New Canadian Prize : IT is announced that a new £10,000 prize, open to Canadian pilots on Canadian machines, has been offered for the first successful trans-Pacific flight from Victoria to Japan.

### AVIATION IN PARLIAMENT : Royal Aircraft Factory, Farnborough

Sir W. JOYNSON-HICKS on October 29 asked the Under-Secretary of State to the Air Ministry how many men are now employed at the Royal Aircraft Factory at Farnborough ; and whether any decision has been arrived at as to the future of such factory ?

Mr. Hope : I have been asked to answer this question. The present strength of the personnel at the Royal Aircraft Establishment, Farnborough, is 2,339, of whom 237 are trade lads and 356 are women. Reductions in the staff are continuing, and it is anticipated that the strength will eventually be reduced to about 1,200. It is proposed that the factory shall be used in future as an experimental and research establishment for the investigation of aerodynamical and aero-engine problems.

Aircraft Production and Inspection Departments

Sir W. JOYNSON-HICKS asked the Under-Secretary of State to the Air Ministry whether the Aircraft Production Department and the Aircraft Inspection Department are still in existence ; and what is the number of personnel and the cost of such departments, respectively ?

Mr. Hope : The Aircraft Production Department, of which the Aircraft Inspection Directorate forms a part, is still in existence. The total headquarters staff is 1,932, the annual cost in salaries being £422,897. These figures include the staffs of the three Directorates of Supply, Research, and Inspection, together with the Accounts Branch and other common services. The staff of the Aircraft Inspection Directorate alone numbers 300, of which the annual cost is £88,507.

Route to Egypt Inquiry Committee.

Sir W. JOYNSON-HICKS asked the Under-Secretary of State for Air who are the officers making inquiry into the recent losses on the Egypt route, and if evidence is being taken on oath ?

Maj.-Gen. Seely : The members of the Committee of Inquiry referred to are as follows :—

President; Air Vice-Marshal E. L. Ellington, C.B., C.M.G., C.B.E., Director-General of Supply and Research, Air Ministry.

Mr. G. B. Cockburn, O.B.E., Head of the Accidents Branch of the Department of the Controller-General of Civil Aviation, Air Ministry.

Air Commodore H. R. M. Brooke-Popham, C.B., C.M.G., D.S.O., A.F.C., Director of Research, Ministry of Munitions.

Air Commodore A. R. Borton, C.M.G., D.S.O., A.F.C.

The last-named officer has had great experience of the work to be investigated by the Committee. He has flown in a Handley-Page machine over the route to India and has surveyed part of the route on to Australia. The Committee is not taking evidence on oath.

#### RAF Branches :

1. Flying Branch
2. Administrative
3. Technical Branch : Pilot Officers to be Flying Officers, without the pay and allowances of that rank
4. Medical Branch
5. Dental Branch
6. Chaplains' Branch

11 December 1919 : Churchill and Trenchard present to Parliament a plan outlining proposals for deploying and financing the Air Force. Here is the original, official government publication, bearing a three-paragraph introductory note from Churchill as Secretary of State for Air dated 11 December 1919. The Memorandum clearly conveys Churchill's and Trenchard's struggle to firmly establish and viably sustain the fledgling service: "The problem of forming the Royal Air Force on a peace basis differs in many essentials from that which confronts the older services. The necessities of war created it in a night, but the economies of peace have to a large extent caused it to wither in a day, and we are now faced with the necessity of replacing it with a plant of deeper root"

- See more at: <https://www.churchillbookcollector.com/pages/books/001500/winston-s-churchill/permanent-organization-of-the-royal-air-force-note-by-the-secretary-of-state-for-air-on-a-scheme#sthash.vXcDoqGo.dpuf>

11 December 1919 : Airco DH.4A G-EAHF operated by Aircraft Transport and Travel crashes at Caterham en-route from Hounslow to Le Bourget killing the pilot and passenger.

27 December 1919 : First flight of Boeing Model #6, B-1 Flying Boat (similar to Curtis HS-2L) at Lake Union, Wa. USA.

December 1919 : Canadian News papers publish the Canada Air Board issued "Air Regulations " which come into effect 17 January 1920.

## Notes on "Civil Aviation"

December 1919 : RAF strength is now 12 Sqns, 31,500 total persons

"Flight" Copyright

Vickers Vimy "Commercial" Passenger aeroplane - 2x Rolls-Royce Engines

British civilian flying, as regards the running of regular services over specified routes, commenced in 1919.

1919 : Aircraft Transport and Travel "A.T.T." begins regular service between London and Paris using converted WW1 aircraft.  
Colonel Frank Searle

Partly owing to the uneconomical nature of the machines, and partly owing to the lack of any Government assistance, this firm had to cease operations, but not before a very great deal had been learned about the conditions to be met with in running such a service, and, incidentally, having proved the feasibility of keeping to a fixed time-table and flying with good regularity, coupled with safety to passengers.

1919 : Handley Page Transport, Ltd. operates a London-Paris route. During 1919-20, a service was also run between London and Brussels and London and Amsterdam. These "services" were run without Government assistance in competition with foreign subsidised services. Handley Page Ltd started conversion of its O/400 and V/1500. The first aircraft to be converted were four O/400s with the military identities: D8350, F5414, F5417 and F5418. They were stripped from their military equipment and then wicker seats were installed.

In 1922 - three British firms were operating subsidised services on the London-Paris route, but this resulted in a great deal of undesirable competition between the British firms, and caused a certain amount of overlapping and duplication of ground organisation.

A few months ago it was decided to allocate to each of the three British operational companies a separate and distinct route:

Handley Page Transport, Ltd., operate the London-Paris service ;  
Instone Air Line. Ltd., operate the London-Brussels-Cologne service,

## Notes on "Civil Aviation"

Daimler Airway operate the Manchester - London - Amsterdam service, the latter to be extended to Berlin as soon as the necessary arrangements can be made.

### The Daimler Airway

Colonel Frank Searle, formerly with Aircraft Transport and Travel

Major Woods Humphrey, formerly with Handley Page, Ltd.

The Daimler Airway is a branch of Daimler Hire, Ltd.,

high performance D.H-34's, with Napier " Lion " engines, Seats for ten passengers, proved economical to run on daily service between London - Manchester and London (Croydon) - Amsterdam.

### Handley Page Transport, Ltd.

With the exception of a short interruption in 1921, due to the impossibility of running unsubsidised services in competition with French subsidised ones, Handley Page Transport, Ltd., have operated the London-Paris service since 1919.

Mr. E. Cogni, Manager;

12 passenger Handley Page H.P. W-8B's with two Rolls- Royce " Eagle " engines, chosen because the firm is of the opinion that a twin-engined machine reduces to a minimum the risk of forced landings on unsuitable ground, the one engine being sufficient to enable the machine to reach a good landing ground, even if not able to reach its destination.

Unless the H.P. W-8B carries full load, it should be able to complete its journey on one engine.

1923 : Handley Page Transport, Ltd. places the 16 passenger H.P. W-8C into service.

### Instone Air Line, Ltd.

1918 : Messrs. S. Instone and Co., Ltd., purchase a D.H.4A for the purpose of rapid communication between their various offices in England and on the Continent. This marked the "beginning of this firm's interest in aviation, and a number of different machines were gradually acquired, and used on the London-Paris service.

April 1922 : Messrs. S. Instone and Co., Ltd. (Sir Samuel Instone, chairman) was made into a limited company under the title Instone Air Line, now operating a daily London - Brussels - Cologne - Brussels - London service.

Several types of machines are operated,

D.H.34, with Napier " Lion " engine,

Vickers Vimy- Commercial, with two Rolls-Royce engines

Vickers Vulcan eight-seater, with one Rolls-Royce " Eagle " engine.

**1919 : EDUCATIONAL DEVELOPMENTS IN THE DOMINION OF CANADA**

Certain educational activities are common to most, if not all, of the Provinces of the Dominion; and these will be considered in their general listings before the local and individual problems of the several Provinces are taken up.

Chief of these general movements are the following:

According to immigration statistics, Canada has within the past 10 years received waves of immigration from 26 distinct racial entities.

**VOCATIONAL WORK FOR RETURNED SOLDIERS.**

The care of the returned Canadian soldier has devolved entirely upon Military Hospitals (Commission established and given extensive powers by successive orders in council. This commission works together with a committee of both houses of the Canadian.

Parliament in the training and reeducation of wounded, disabled, and convalescent soldiers. In the system provided, the training for new occupations of men who can not resume their former occupational vocational

reeducation is the phase of deepest educational significance. Under this head, and responsible to the commission first named, nearly every Province has the following organizations:

1. A Provincial Disabled Soldiers' Training Board, which determines who are fit subjects for vocational reeducation.
2. A body having generally advisory powers for securing the coordination of local efforts and the cooperation of educational institutions.
3. Vocational officials in immediate charge of work in each locality under the Vocational Secretary of the Dominion, with headquarters at Ottawa.
4. Various organizations, such as the Returned Soldiers' Employment Commission) which have charge of placing the men in bread winning occupations.

The efficiency with which all these agencies cooperate necessarily varies widely in the several Provinces; perhaps the finest illustration of the practical working of the general plan is to be seen in the western Province of Alberta, from which many of the first enlistments in the Canadian expeditionary force came.

At the Military Convalescent Hospital at Ogden, military organization and discipline prevail. In addition to systematic treatment involving occupational therapy of the most modern type, specialized vocational reeducation is given in:

- (1) Commercial courses of six months;
- (2) Instruction of disabled soldiers, foreigners who had enlisted in the Canadian forces, in English;
- (3) GIN-service examination courses;
- (4) Manual arts;
- (5) Gardening and poultry raising;
- (8) Industrial trades along the line of the vocational survey of the Province of Alberta projected just as the war broke out, with instruction at the Provincial Institute of Technology and Art at Calgary, organized as a link in the general system of public instruction in Alberta, and for the present turned over exclusively to disabled soldiers. Many problems of vocational training are here being worked out with remarkable success. The caliber of the students and the relation between them and the educational authorities may be seen in the fact that a students' council at the institute has powers of self government, works out programs of study, recently voted for an increase in daily hours of work, and has frequently been asked for advice on the contents of courses.

In March, 1918, the vocational training branch of the Provincial Invalid Soldiers' Commission had under its instruction more than 3,000 returned soldiers.

Dominion-wide interest in this world problem did not cease with the cessation of hostilities.

At the convening of the Canadian Parliament in February, 1919, it was announced in the speech from the throne that bills would be submitted for the further promotion of vocational education in all its phases, and that a recent order in council had provided substantial increase of vocational pay and allowances to returning soldiers while undergoing such re-education.

Perhaps the most vital bond of union between the Provinces from the point of view of teaching is the Dominion Educational Association. The Dominion Educational Association includes representatives from each Province, meets annually in November, in Ottawa, and constitutes a clearing house for the interchange of educational ideas, besides contributing substantially to the growing federalistic consciousness.

A few of the salient subjects discussed at its 1918 meeting :

- a) The Relation of "Technical" to "Complete Education"

## Notes on "Civil Aviation"

- b) Education for the New World after the War
- c) The Returned Soldier What Can We Do for Him

### CONTINUATION SCHOOLS.

The continuation schools have grown steadily during the past two years. In spite of difficulties of accommodation and equipment, the favoring regulations and the liberal system of provincial grants made to this type of school have advanced their usefulness, though with the confusion incidental to the war only the largest centers have as yet such schools in full operation. The inspector of the district which enrolls the largest number of such schools advocates making obligatory that every continuation school employing two teachers and every high school having four teachers or less shall establish departments of agriculture and household economy giving a two year course and winter courses in each; that schools with a staff of more than six teachers shall establish departments of technical training; and, household economy; provision should be made for training a sufficient number of the best available teachers, the burden of expense being distributed over the municipalities that derive benefit from such a school, and attendance of pupils for the greater part of the time between the ages of 14 and 17 being made compulsory.

For the past two years the decrease in the attendance of boys upon the continuation schools has been noticeable, more particularly among the first-year pupils, attributable to the great scarcity of labor on the farms, necessitating the work of the larger children at home.

In industrial centers, the decrease is due to the attraction of high-school boys and girls to employments paying high wages. According to the report of the inspector of the district, which shows more distinctively rural allocations?

When first established, "continuation schools" were expected to provide secondary education for the youth of the rural and village communities of the Province, and so had a strong tendency toward training for country life by means of slaking agriculture one of the chief subjects of study. Unfortunately, the continuation schools have not to any great extent fulfilled such expectations.

In rural or village communities the continuation schools are now simply "high schools" providing:

- i. courses similar to those in the city high schools
- ii. courses fitting youths for the teaching profession, and
- iii. courses for entrance in the universities and professional colleges.

### INDUSTRIAL AND TECHNICAL EDUCATION.

Full development of the various types of schools contemplated by the Industrial Education Act, 1911 is interrupted by WW1, Post WW1 representatives of every type provided for by the Industrial Education Act, 1911 have been established:

- i. Day schools, including general industrial schools,
- ii. Technical high schools and high-school courses,
- iii. Part-time cooperative industrial courses for apprentices actually employed,
- iv. School and courses for instruction in the fine and applied arts; and
- v. Night schools distinctively for adult workers.

The needs of the war have brought special emphasis to bear upon the instruction of apprentices.

Public-spirited employers in some places have offered tangible inducements to attend classes in mechanical drawing and shop mathematics, and in one instance managers allow one month to be deducted from the year's apprenticeship for a faithful winter's work in night school classes upon these subjects.

War needs have also brought to the front the value of classes for women in domestic science.

Perhaps the greatest progress in industrial and technical education has been made in the development of the "day schools" which reach boys and girls under 14 who can not be given such training in the public schools, and who have not the maturity of mind to do successful night school work.

The INDUSTRIAL AND TECHNICAL branch of education has also received great stimulus from the attendance of returned soldiers in trade and technical classes, this having been affected by arrangements with the Dominion agencies already mentioned, which used the already established courses for the re-education of disabled soldiers.

## Notes on “Civil Aviation”

-The farthest reaching piece of legislation relative to higher education in the Dominion was enacted in 1917 by the assembly of Manitoba *on the basis of the bill submitted by the minister of education*, re-modelling the constitution of the University of Manitoba., *providing for a board of governors of nine members vested with full power over the financial affairs of the university and the final decision of all matters of academic policy.*<sup>140</sup>

<sup>140</sup> US DEPARTMENT OF THE INTERIOR - BULLETIN, 1919, No. 49 “EDUCATION IN PARTS OF THE BRITISH EMPIRE” - US BUREAU OF EDUCATION BIENNIAL SURVEY OF EDUCATION 1918-1818.

**1919 : ROYAL COMMISSION ON INDUSTRIAL TRAINING AND TECHNICAL EDUCATION**

**ROYAL COMMISSION ON INDUSTRIAL TRAINING AND TECHNICAL EDUCATION, 1910**

The appointment by the Dominion Government of the Royal Commission on Industrial Training and Technical Education in 1910, coincided with or possibly resulted from an active interest in vocational education throughout the whole Dominion, and marked the beginning of the present development. The commissioners, after carefully studying the existing conditions and requirements in Canada and inspecting the work being done in the United States, Great Britain, and parts of Europe, recommended a development policy and a complete system of secondary vocational education for Canada. This system, while retaining provincial control of education, provided for federal, provincial, municipal, and private financial contributions and close cooperation between schools and industry. technical education consisting of the craft schools was present in Canada at this time.

The 2 types of work suggested for urban communities were as follows:

Division "A" For those who are to continue at school"

- I. Intermediate industrial classes (or schools).
- II. Co-ordinated technical classes (or schools).
- III. Technical high schools.
- IV. Apprentices' schools.
- V. Industrial and technical institutes.
- VI. Technical, home economics and fine arts colleges.

Division "B" For those who have gone to work:

- I. Continuation classes (or schools).
- II. Co-ordinated technical classes (or schools).
- III. Middle technical classes (or schools).
- IV. Apprentices' classes (or schools) in workshops.
- V. Industrial and technical institutes.
- VI. Correspondence-study courses.

**DOMINION OF CANADA - TECHNICAL EDUCATION ACT, 1919**

One result of the Treaty of Versailles requiring Vocational and Technical training as one of its' clauses, was the "Technical Education Act" was enacted by the Parliament of the Dominion of Canada in July, 1919. "it is realized that if Canada is to keep up in the commercial race the technical school accommodation must be increased..."

"There are those who would restrict the work of technical education to such instruction or training as would improve the efficiency of the boy or girl as a productive machine. The adoption of such a policy would create an army of slaves instead of an army of happy, industrious citizens. It has, therefore, been decided that the aims of vocational education in Canada shall, as far as possible, be those laid down by the Commission. On this basis the dominant purpose of any course of vocational education shall be to train for citizenship, the fitting for useful employment being regarded as the crowning element in the educational system. Before

starting on a definite course of vocational training, the pupil should be aided and encouraged in finding his own aptitudes and in selecting a vocation for which his native ability is best suited. In accordance with the aims set forth above, emphasis should be placed on the development of character and ability to co-operate with others. This involves the development in the individual goodwill toward others, loyalty to the community, and a definite sense of responsibility for the maintenance and improvement of organized society."

## Notes on "Civil Aviation"

technical education has consisted of "practical and applied" subject matter. Originally practical is known as manual or "shop" training,

Technical education" and "vocational education" are sometimes thought to refer to the same thing since early in this century technical education included most courses that entailed manipulation of materials or mechanical equipment and the applied principles of engineering. This could be for general education or for career preparation and be found within secondary education and post-secondary education. Technical education courses teach: properties of materials and components; methods of fabricating and constructing useful items from such material and components; the identification and proper use of tools for professional and recreational purposes; basic theory and principles of various technologies, often linking instruction with other subjects such as physics and chemistry; analysis of industrial and manufacturing systems and methods; and the application of technology. Vocational education, now usually refers to a multi-year program or a series of courses providing specialized instruction in a skill or trade intending to lead the student directly into a career or apprenticeship program based on that skill or trade.

Influenced by technical education curricula in industrialized countries of Europe and the US, and concerned with consistency in technical education across the country, the federal government established a Royal Commission on Industrial Training and Technical Education in 1910. an influential piece of legislation arising from these findings was the Ontario Industrial Education Act of 1911. This legislation established a policy towards the implementation of technical education programs in general and formalized manual training as part of the Ontario curriculum.

The largest expenditure of federal funds for education came through the Technical and Vocational Training Assistance Act of 1960, designed to help the provinces replace and augment equipment in secondary schools, and to construct new vocational high schools, institutes of technology and adult-training centres.

Although technical education programs are offered at some Canadian universities as part of a Bachelor of Education degree, such programs became primarily intended to instruct "prospective teachers" in the methods and content necessary to teach technical education subjects in secondary schools.

From its origins in manual training "shop" and industrial arts, technical education has consisted of practical and applied subject matter. Source ref : <http://www.thecanadianencyclopedia.ca/en/article/technical-education/>

### ROYAL MILITARY COLLEGE—REPORT OF THE BOARD OF VISITORS, 1919.

The Board assembled at the Royal Military College on Monday, May 19, 1919.

Chairman—Hon. Colonel Sir R. A. Falconer, K.C.M.G., M.A., LL.D., D. Litt. - R. A. Falconer = President of University of Toronto - effort made to remove trades / ground engineers from university program - RMC influence?

"Technical" and "industrial" are thus included in "vocational" education.

The latter term, being the most comprehensive and the one generally used in the United States, will in future be used to include all work to be promoted under the provisions of the Act. "Technical Education," as defined in the Act, "means and includes any form of **vocational technical or industrial education** or instruction approved by agreement between the Minister of Labour and the Government of any province as being necessary or desirable to aid in promoting industry and the mechanical trades, and to increase the earning capacity, efficiency and productive power of those employed therein. According to this definition, technical education may include any form of education or training which will fit a boy or girl for useful employment in any chosen vocation. The vocations for which education and training have been established are: (1) the professions (involving a degree), (2) teaching (elementary and high school), (3) agriculture - a federal grant has been given for this work. In accordance with the above, all work of college grade (courses leading to a degree), the training of nurses, the training of teachers for elementary and high schools, and agricultural education have been excluded from the benefits of the Act. The work of the elementary schools and the academic courses in high schools, including manual training, are excluded because they are not vocational, and secondly because they have been long established and provided for. With the above noted classes of education work eliminated, the field for vocational training is fairly well defined. Source ref: Labour Gazette : January 1921 pg 51-53.

### Ontario

Ontario's program of vocational education is the most diversified and highly organized in Canada. Cultural and academic subjects are given first place in vocational schools, and no attempt is made to produce skilled workers in any branch of industry. A broad

## Notes on "Civil Aviation"

foundational training is aimed at, rather than specialized training in any one branch of industrial or commercial life. The schools endeavour to maintain close contact with industry through evening classes, part-time and continuation classes, employment service for graduates, and occupational information. Apprenticeship is encouraged, and this year a provincial apprenticeship council for the building trades was established in Toronto.

Teacher-training is centralized in the Training College for Technical Teachers at Hamilton, but the staff of the college gives instruction to evening school teachers in various centres, during the winter months.

The College of Art, in Toronto, serves the whole province, while some of the larger technical schools have well organized art departments.

Commercial courses in the province vary from two-year courses in the high schools, which are not recognized as vocational, to the five-year courses of the Toronto High School of Commerce. Most vocational commercial courses cover three years' work and are organized as branches of the technical schools.

The larger cities have separate vocational or technical schools, but the smaller places usually organize vocational departments in connection with the other departments of a composite or cosmopolitan high school. The vocational work is divided into five branches: 1. Technical and industrial, 2. Commercial, 3. Home Economics, 4. Applied Art, 5. Agricultural. Federal grants are not paid on the agricultural work.

Vocational education in Ontario had become fairly well established by 1919. Day classes were operated in eleven cities and evening classes were carried on in thirty-six municipalities. In 1927, day schools were established in thirty-two municipalities, and evening classes were operated in fifty-seven centres. The enrolments in 1927 were 21,684 for day schools and 37,977 for evening classes. The total expenditures on all types of secondary vocational education in the province exceed \$4,000,000 annually. During the three-year period from 1920 to 1922 the expenditures on new buildings exceeded \$5,000,000, and the building program has not slackened since. The provincial government each year earns considerably more than the amount available under the Technical Education Act.

### Alberta

A good beginning in vocational education had been made by the Province of Alberta before 1919. A pre-vocational school in Calgary provided industrial, commercial, and home economics courses in grades 7, 8 and 9. A technical school in Edmonton offered four types of work, viz., pre-vocational, industrial, technical matriculation, and special courses. Commercial schools were operated in three centres and evening classes were conducted in four municipalities.

Plans were completed in 1919 for the erection of the Provincial Institute of Technology and Art in Calgary, to take the place of the classes which had been carried on, since 1916, in temporary quarters. The new building was completed in 1922 and the work in this institution has grown steadily. A large wing was added to the shop buildings in 1926 and all classes are filled. The work is all of an industrial nature. The Institute provides fulltime two-year courses, short-term winter courses, summer courses, and evening courses, for pupils from all parts of the province. It also conducts correspondence courses in stationary engineering and mining.

Day school work in Alberta, although slightly increased, is still confined to the four cities mentioned above. Evening classes have been operated in as many as twenty different centres, but owing to a period of depression, particularly in the mining districts, the classes have been discontinued in a number of centres. Nine municipalities were carrying on evening classes in 1927, with a total enrolment of 2,107 pupils. The total enrolment in day classes was 2,034.

Conditions have greatly improved during the past two years and the outlook for the future is very hopeful.

Engineering education and the professional training of teachers, doctors, dentists, etc., which, while vocational, are a part of college or university work and are not usually referred to as vocational education.

Manual training and domestic science, which were pioneer subjects in the development of secondary vocational education, are not dealt with because these subjects are now established parts of the academic branch of school work.

Technical education programs were administered separately from other parts of the school curriculum. After 1914, they were under the administration of the Director of Technical Education. The Technical Branch was responsible for technical training in public high schools, including vocational, home economics, and agricultural programs. The branch was also responsible for liaison with the Department of Agriculture, which offered vocational training programs at its college at Olds. The Director of the Technical Branch became the Principal of the Provincial Institute of Technology and Art at the time that this institution was established in 1916. The school operated as a division of the department until its transfer to the Department of Advanced Education in 1971. The Technical Branch was responsible for the administration of Dominion/Federal-Provincial training programs. In 1937, the branch was renamed the Canadian Vocational Training Branch. In 1959, the branch was renamed the Division of Vocational Education. In 1960, a second provincial institute of technology in Edmonton was authorized by the Minister. The first institute was renamed the Southern Alberta Institute of Technology. The new institute was named the Northern Alberta Institute of Technology.

the Federal Government imposed:

## Notes on "Civil Aviation"

a system of education on the provinces without adequate study.

a system of education on the provinces without the constitutional power to enforce its program.

1891 one of the first technical schools in Canada opens - offering evening classes only, in Toronto by an independent board .  
Historically, vocational-technical education has not been a high priority area for the typical education reformer - he Smith-Hughes  
National Vocational Education Act of 1917 was an act of the United States.

### 1919 - 1925 : LLOYD'S REGISTER

- A. founded in London in 1760 to examine merchant ships and 'classify' them according to their condition.
- B. In the 1900s, LR brought its expertise to bear in other industries, in particular the energy sector.
- C. In the 1900s, LR widened its services to include management systems certification.
- D. Immediately after World War I, Lloyd's Register was approached by the Society of British Aircraft Constructors and asked to take on aircraft inspection. At that time aircraft were built of wood and canvas and the Committee declined.
- E. 1930, the General Committee appointed an Aviation Committee and aviation surveyors. They inspected RAF training aircraft and private aircraft, including the Duchess of Bedford's airplane, The Spider, which she piloted to South Africa and back.
- F. In the early '30s as the commercial air industry began to grow, it was felt that a governmental authority should handle aircraft inspection and the Civil Aviation Authority was born out of the Air Ministry. (Lloyd's Register: From Coffee House to Post-Modernist building, 29 June 2015 [www.lr.org/en/\\_images/213-35658\\_31-lloyds-register-pics.pdf](http://www.lr.org/en/_images/213-35658_31-lloyds-register-pics.pdf))

### The Salary Situation

Members throughout Canada are eagerly awaiting news regarding what the Dominion Government proposes in connection with increasing the salaries of engineers and technical men employed by the Government. This is a matter which concerns every member of The Institute, either directly or indirectly, and is also one in which every member can give assistance. In the last number of The Journal, following the direction of Council, a notice was inserted asking every member to use his influence in this connection. From that time up to the present no definite information has been received as to what the Government proposes apart from the fact that an announcement has been made that a Bill is to be brought before the House embodying the recommendation of the experts of the Civil Service Commission.

As an evidence of the interest which this question has aroused, practically every branch has notified headquarters that local members of Parliament have been interviewed and their promise of favorable consideration for support to the engineering profession has been received.

There is still a lot to be done.

Every branch, besides securing influence of the members of the Federal House representing its district, has an opportunity of enlisting the support of the public through the press, for no fair-minded editor, on being presented with the facts, would refuse to lend his support to such a worthy cause.

In connection with this question, the chairman of a committee on salaries in one of the branches writes that

he has never seen a committee take up a problem with such earnestness and such enthusiasm, so that successful results are expected.

The problem of increased salaries for technical men involves more than a mere increase in monetary award, as a failure, at this time, to secure such a result means a continuance of the lack of recognition of the value of engineering training and knowledge to the country. It means, further, the continued humiliation of having highly educated, trained, technical men, in positions of responsibility, earning less than the mechanic or foreman under their charge. Surely we are not going to allow this condition to continue.

So strongly do some of the members of Parliament feel on this subject that a number of men have pledged themselves to do their utmost to secure a more equitable basis of remuneration. These supporters are being supplied with information by a committee of the Ottawa Branch and are being well-grounded in the merits of our case.

Whatever differences of opinion members may have on questions of legislation and other subjects, it is universally agreed that here is one problem upon which all can act in hearty accord and to which we should all direct our efforts.

#### Engineers to the Fore

In an account of an address on water power projects given by K. H. Smith, A.M.E.I.C., Secretary-Treasurer of the Halifax Branch before the Commercial Club of Pictou, Nova Scotia, the New Glasgow Enterprise, which devoted several columns to an account of Mr. Smith's address, stated that what most impressed the audience was the fact that people are just beginning to realize that the brainy engineer with a vision will be far more valuable than most other professions during the coming era. The nations of the world are looking forward to material progress to aid them to recover from the losses of the war and no body of men is more greatly needed than engineers to carry on this work.

If, in the face of a tribute such as this, popular appreciation existed to such an extent that the engineer might be enabled to collect at least a reasonable share of the amount he earns, it would give rise to a condition of affairs towards which we have been looking for many years and which it is hoped may before long be attained

## AN ACT RESPECTING THE ENGINEERING PROFESSION

In accordance with a resolution passed at the Annual Meeting in Ottawa on the 12th of February, 1919, providing for the formation of a special committee composed of one delegate appointed by each branch, this committee met at ten o'clock on the morning of Saturday, April 5th, with C. E. W. Dodwell, Chairman, and A. Surveyer, Secretary.

The concrete result of the labours of this committee after three sessions daily for five days, is a tentative Bill which is printed below for the information of members of The Institute. A ballot will be issued to all the members in accordance with the resolution calling for its approval, or otherwise, by the corporate membership.

### THE PROPOSED ACT.

Whereas it is considered advisable to establish by legislation the qualifications necessary to permit persons to act or practise as Professional Engineers.

Now, therefore, His Majesty, by and with the advice

and consent of the Legislature of the Province of

, enacts as follows: "â€" â€"

#### Short Title

1. This Act may be cited as the " Engineering Profession Act."

#### Interpretation

2. In this Act, unless the context otherwise requires, the expression : "â€"â€"

(a) " Professional Engineer " means any person registered as a Professional Engineer under the provisions I of this Act.

(6) The practice of a Professional Engineer within the meaning of this Act embraces advising on, making measurements for, laying out and the design and supervision of the construction, enlargement, alteration, improvements or repairs of public and private utilities, railways, bridges, tunnels, highways, roads, canals, harbours, harbour works, river improvements, light-houses, wet docks, dry docks, dredges, cranes, floating docks, and other similar works, steam engines, turbines,

pumps, internal combustion engines, and other similar mechanical structures, air ships and aeroplanes, electrical machinery and apparatus, chemical and metallurgical machinery, and works for the development, transmission or application of power, mining operations and apparatus for carrying out such operations, municipal works, irrigation works, water works, water purification plants, sewerage works, sewage disposal works, drainage works, incinerators, hydraulic works, and all other engineering works. The execution as a contractor of work designed by a Professional Engineer, or the supervision of the construction of work as a foreman or superintendent, or as an inspector, or as a roadmaster, track master, bridge or building master, or superintendent of maintenance shall not be deemed to be the practice of a Professional Engineer within the meaning of this Act.

(c) " The Association " means the Association of Professional Engineers of the Province of

(d) " Council " means the Executive Council of the Association.

(e) " President " means the President of the Association.

(f) " Registrar " means the Registrar of the Association.

(g) " The Secretary " means the Secretary-Treasurer of the Association.

(h) " Board " means the Board of Examiners of the Association.

The Association of Professional Engineers of the Province of

3. (a) All persons registered as Professional Engineers under the provisions of this Act shall constitute the Association of Professional Engineers of the Province

of , and shall be a body politic and

corporate, with perpetual succession and common seal.

(b) The seat of the Association shall be at

4. The Association shall have power to acquire and hold real estate not producing at any time an annual income in excess of ten thousand (\$10,000.00) dollars, and to alienate, mortgage, lease or otherwise charge or dispose of such real estate or any part thereof as occasion may require; and all fees, fines and penalties receivable and

recoverable under this Act shall belong to the Association.

5. The Association may pass By-laws not inconsistent with the provisions of this Act for: "â€"

(a) The government, discipline and honour of the Members.

(6) The management of its property.

(c) The maintenance of the Association by levying fees not in excess of \$5.00 per annum.

(d) The examination and admission of candidates to the study and practice of the profession.

(e) All other purposes reasonably necessary for the management of the Association.

6. All By-laws or amendments thereto shall become effective only after ratification by two-thirds majority of the votes received from the Members of the Association in good standing.

#### Who May Practise

7. (a) Only such persons who are Members of the Association hereby incorporated and registered as such under the provisions of this Act, or who have received a license from the Council of the Association as hereafter provided, shall be entitled, within the Province of , to take and use the title of " Professional Engineer " or any abbreviation thereof, or to practise as a " Professional Engineer."

(b) Any person residing in the Province of

at the date of the passing of this Act, who is at that date and has been for five years previously practising as a Professional Engineer shall be entitled to be duly registered as a Member of the Association without examination, provided that such person shall produce to the Council, within one (1) year of the passing of this Act, satisfactory credentials of having so practised.

(c) Any person who may come to reside in the Province of and who at that time is a duly

412

JOURNAL OF THE ENGINEERING INSTITUTE OF CANADA

registered Member of an Association of Engineers similarly constituted of any other Province of the Dominion of Canada, may become a duly registered Member of the Association without payment of fee for that year providing he shall produce to the Council a Certificate of Membership in good standing in such Province, and an application for Transfer of Registry endorsed by the Registrar of the Province in which he lately resided.

(rf) Any person not otherwise qualified as herein-before mentioned, residing in the Province of

and who may desire to become a registered member of the Association shall make application to the Council, and shall submit to an examination, or shall submit credentials in lieu of examination, whichever the Council may decide, and shall be admitted to Registry as a Member of the Association on payment of prescribed fees after the Council shall have certified in writing that such examination or credentials have been found satisfactory to it.

(e) Any person not residing in the Province of , who is a registered member of an Association of Engineers similarly constituted of any other Province of the Dominion of Canada, shall obtain from the Registrar a license to practise as a Professional

Engineer in the Province of upon production of

evidence of his registry in such other Province, and upon payment of a fee of one dollar. In the event of such person being unable, by reason of emergency or neglect on the part of the Registrar or for any other good and sufficient reason, to obtain such license within three (3) months of his making application therefor, he shall be entitled to practise as a Professional Engineer in the Province for such period of three months without holding such license.

(f) Any person who is not a resident of Canada, but who is a Member of any engineering or technical organization or society of standing, recognized by the Council, may obtain a license to act in an advisory or consultative capacity to a registered member of the Association.

(y) Any person who is employed as a Professional Engineer by a public service corporation, a private corporation, public utilities or Government department, whose business is normally carried on in two or more of the Provinces of Canada, and who is by reason of his employment! required to practise as a Professional Engineer in other Provinces than that of his residence, may so practise in the Province of , without holding a non-resident license, or payment of fee, providing such person can on demand of the Council produce credentials satisfactory to the Council showing that he is a registered member of an Association of Engineers similarly constituted of some other Province of Canada. It shall be the duty of such person to produce such credentials whenever

so required by the Council.

(/i) Any Professional Engineer who is a resident of some other Province of Canada in which there is no Association of Engineers similarly constituted, may obtain a license to practise, subject to the discretion of the Council.

(i) Assistants working under the direct supervision of a Professional Engineer and not taking responsibility for their work other than to their direct superiors shall not

be deemed to be practising as Professional Engineers when so engaged.

(J) The provisions of this Act shall not apply against any person employed in actual service in His Majesty's Naval, Military or Aerial Service.

(k) In the case of Engineers who were practising in

the Province of , and who have been accepted

for overseas service in the present war in the forces of Great Britain, or any of her Allies, shall on their return to Canada be entitled to all the rights and privileges conferred under sub-section " b " of Section 7.

#### Partnership

8. In the case of two or more persons carrying on practice as Professional Engineers in co-partnership only such members who are registered or licensed under this Act, shall individually assume the function of a Professional Engineer. A firm as such cannot be deemed to be a Member of the Association or be licensed to practise.

#### Administration

9. (a) There shall be a Council of Management of the Association to consist of a President, Vice-President

and Councillors, to be elected by

the Association, and hold office as hereinafter provided. All Members of the Council shall be registered under the provisions of this Act.

(b) The President shall be elected annually and shall hold office until his successor is elected. He shall act as presiding officer at the meetings of the Council and of the Association, voting only when the votes are evenly divided. On retirement he shall hold office as Councillor for the next year succeeding.

(c) The Vice-President shall be elected annually and shall have all the powers of the President during the absence

of the latter.

(d) Councillors shall be elected for the

first year after the coming into effect of this Act; thereafter

only Councillors shall be elected each year.

The Councillors receiving the largest

number of votes at each annual election, after the first election, shall act for two years.

#### Suspension for Misconduct

10. (a) The Council may, in its discretion, reprimand, censure or suspend or expel from the Association any Engineer guilty of unprofessional conduct, negligence, or misconduct in the execution of the duties of his office, or convicted of a criminal offence by any Court of competent jurisdiction.

The Council shall not take any such action until a complaint under oath has been filed with the Registrar and a copy thereof forwarded to the party accused. The Council shall not suspend or expel an Engineer without having previously summoned him to appear to be heard in his defence, nor without having heard evidence under oath offered in support of the complaint or on behalf of the Engineer. The Council shall have the same powers

#### JOURNAL OF THE ENGINEERING INSTITUTE OF CANADA

413

as the Court to compel witnesses to appear

and to answer under oath in the manner and under the

penalties prescribed by the code of The

President of the Council or person acting as such in his absence, or the Secretary, is hereby authorized to administer oaths in such cases. All evidence shall be taken in writing or by a duly qualified stenographer.

(6) Any Engineer so expelled or dismissed may, within thirty days after the order or resolution of suspension or expulsion, appeal to a judge of the Supreme Court from such order or resolution, giving seven days' notice of appeal to the Council, and may require the evidence taken to be filed with the proper officer of the Court, whereupon

such judge shall decide the matter of appeal upon the evidence so filed and confirm or set aside such suspension or expulsion, without any further right of appeal; and if the suspension or expulsion be confirmed, the costs of such appeal shall be borne by the Engineer.

(c) Unless the order or resolution of suspension is set aside on such appeal, or the judge or the Council otherwise order, the Engineer so suspended or expelled shall not practise further, except (in case of suspension) upon expiry of the period of suspension. Pending an appeal the Engineer so suspended or expelled shall not practise.

#### Penalties

11. Any person who not being a registered or licensed Professional Engineer in the Province or who is suspended or has been expelled under the proceedings of the next preceding section:

(a) Practises as a Professional Engineer; or,

(b) Usurps the functions of a Professional Engineer ; or,

(c) Assumes verbally or otherwise the title of Professional Engineer, or makes use of any abbreviation of such title, or of any name, title, or designation which may lead to the belief that he is a Professional Engineer, or a member of the Association; or,

(d) Advertises himself as such in any way or by any means; or,

(e) Acts in such manner as to lead to the belief that he is authorized to fulfil the office of or to act as a Professional Engineer,

shall be liable upon summary conviction to a fine of not less than \$100.00, nor more than \$200.00, and on failure to pay the same to imprisonment for not more than three months for the first offence, and for any subsequent offence to a fine of not less than \$200.00 nor more than \$500.00, and on failure to pay the same to imprisonment for not more than six months.

#### Evidence

12. The certificate of the Registrar under the seal of the Association shall be prima facie evidence of registration or license, or non-registration, as the case may be.

#### Examinations

13. The Board of Examiners shall be nominated and appointed annually by the Council, subject to such approval as the Government of the Province may require.

14. (a) Examinations of candidates for registration or license shall be held as often and at such places as the Council may direct.

(6) The scope of the examinations and the methods of procedure shall be prescribed by the Council with special reference to the applicant's ability to design and supervise engineering works which shall insure the safety of life and property.

(c) The candidate shall submit to examination before the Board on the Theory and Practice of Engineering, especially in one or more of the recognized branches of engineering at his option.

(d) As soon as possible after the close of each examination the Members of the Board who shall have conducted such examination shall make and file with the Secretary a certificate stating the result of such examinations, whereupon the Council shall notify each candidate of the result of his examination and of their decision upon his application.

(e) A candidate failing on examination may after an interval of not less than one year be examined again.

(/) The Council shall, from time to time, prescribe the fees payable by candidates for examination.

#### Registration Wiilimii Examination

15. The Council shall consider an application for registration or license from any person who submits proof of qualifications possessed by such person by virtue of experience, training or examination by another examining body of recognized standing.

16. The Council shall have power to establish conjointly with any Council of any Association similarly constituted in one or more of the Provinces of Canada, a Central Examining Board, and to delegate to such Central Examining Board all or any of the powers possessed by the said Council respecting the examinations of candidates for admission to practise, provided that any examination conducted by such Central Examining Board shall be held at least in one place within this Province.

17. The board shall examine all degrees, diplomas, certificates and other credentials presented or given in evidence for the purposes of obtaining registration or license to practise, and may require the holder of such credentials to attest by oath or by affidavit on any matter

involved in his application.

18. (a) Notwithstanding any other provision of this Act, no person shall be registered unless at least twenty-three (23) years of age, and unless he has been engaged for

414

JOURNAL OF THE ENGINEERING INSTITUTE OF CANADA

eight (8) years in some branch of engineering, except in the case of a graduate from a recognized Engineering College, in which case the period of engagement in engineering work shall be reduced to six (6) years, which may include his term of instruction.

(6) Candidates for admission to practise who, for any reason, have been unable to take advantage of an academic engineering course, must serve at least six (6) years under a registered Engineer or under a Professional Engineer of recognized standing, and pass a preliminary examination satisfactory to the Board.

19. The Registrar shall issue a certificate of registration or a license to practise to an accepted candidate upon written instructions from the Council, and upon payment in advance of the prescribed fee by the candidate.

20. The Registrar shall keep his register correct, in accordance with the provisions of this Act, and the rules, orders and regulations of the Council.

21. (a) Each person who is registered or licensed to practise shall pay in advance to the Secretary-Treasurer, or any person deputed by the Council to receive it, such annual fee as may be determined by By-laws of the Association, which fee shall be deemed to be a debt due by the practitioner and to be recoverable with the costs of same in the name of the Council in any court of competent jurisdiction.

(b) If any registered practitioner omit to pay the prescribed annual fee within six months of the date upon which it became due, the Registrar shall cause the name of such practitioner to be erased from the register, and such practitioner shall thereupon cease to be deemed to be a registered practitioner; but such practitioner shall, at any time thereafter, upon paying such fee, be entitled to all his rights and privileges as a registered practitioner from the time of such payment.

(c) The Registrar shall not be required to issue a

license to practise to any non-resident practitioner otherwise entitled to such license unless the fee provided for by the By-laws of the Association shall have been previously paid.

22. Any person entitled to be registered under this Act who shall neglect or omit to be so registered shall not be entitled to any of the rights and privileges conferred by the provisions of this Act so long as such neglect or omission shall continue.

23. In the case of any refusal by the Council to register the name of any person as a Member of the Association, or of refusal to issue a license to practise, the person aggrieved shall have the right to apply to a judge of the Supreme Court, who, upon due cause shown, may issue an order to the Council to register the name of such person, or to grant him a license to practise, or make such other order upon such appeal as may be warranted by the facts, and the Council shall forthwith comply with such order. Such order when so made shall be final.

24. If the Registrar makes or causes to be made any wilful falsification in any matters relating to the register,

he shall forfeit a sum of not less than one hundred dollars (\$100.00).

25. If any person shall wilfully procure or attempt to procure himself to be registered or licensed under this Act, by making or producing, or causing to be made or produced any false or fraudulent representations or declaration, either verbally or in writing, every such person so doing, and every person knowingly aiding and assisting him therein, shall forfeit and pay a sum of not less than one hundred dollars.

26. All penalties imposed under this Act, or any of them, and all sums of money forfeited shall be recoverable with costs under the provisions of the law respecting summary convictions.

27. Any information for the recovery of any such penalty or forfeiture may be laid by any Member of the Association or by any person appointed by the Council.

28. Any sum forfeited under this act being recovered shall belong to the Association for the use thereof under this Act.

29. No prosecution shall be commenced for any offence against this Act after one year from the date of committing the offence.

30. The following persons are hereby constituted a Provisional Council of the Association:â€”

President

Vice-President

Councillors

The duties of the Provisional Council shall be to provide the register called for by this Act, to enter therein the names of those who are entitled to registration and who apply therefor under the provisions of Section 7, clause " b," and to call within six months from the coming into force of this Act the first General Meeting of the Association for those purposes and any other organization purposes of the Association; they shall have the powers conferred in this Act on the Council of the Association. Their powers shall cease on the election of the regular Council of the Association.

31. No provisions of this Act restricting the practise of the profession or imposing penalties shall take effect until one year after the passing of this Act.

32. Every person registered under this Act shall have a seal, the impression of which shall contain the name of the engineer and the words " Registered Engineer,

Province of " with which he shall stamp

all official documents and plans.

33. The activities of the Association are hereby restricted to the functions necessary to the administration of this Act.

Professional Engineers

On another page will be found a copy of the draft act submitted by a special committee of the branches, which is designed to establish a body of professional engineers in Canada. The committee who drew up this act as a result of the resolution of the annual meeting were: " C. E. W. Dodwell, M.E.I.C, Chairman; A. Surveyer, M.E.I.C. Secretary; C. C. Kirby, M.E.I.C; A. R. Decary, M.E.I.C. R. F. Uniacke, M.E.I.C; Willis Chipman, M.E.I.C.

E. R. Gray, M.E.I.C; N. L. Somers, A.M.E.I.C; E. E. Brydone-Jack, M.E.I.C; H. R. McKenzie, M.E.I.C.

## Notes on "Civil Aviation"

F. H. Peters, M.E.I.C; R. J. Gibb, M.E.I.C; A. G. Dalzell, A.M.E.I.C; and A. E. Foreman, M.E.I.C

The western delegates met at Winnipeg en route to Montreal and spent two days together discussing the broad subject of legislation. No group of men could have worked harder than the men sent by the different branches for this purpose. It is to be noted that the members of The Institute are given no preference whatsoever in this proposal, while the expense of this meeting is being borne The Special Legislation Committee of the Institute which drew up the proposed bill for professional engineers during its sessions at the headquarters of the Institute from April 5th to the 10th, reading from left to right:

Arthur Surveyer, M.E.I.C, Montreal, Secretary of the Committee; E. E. Brydone-Jack, M.E.I.C, Winnipeg, Man., R. J. Gibb, M.E.I.C, Edmonton, Alta., F. H. Peters, M.E.I.C, Calgary, Alta., R. F. Uniacke, M.E.I.C, Ottawa, Ont., E. R. Gray, M.E.I.C, Hamilton, Ont., A. R. Decary, M.E.I.C, Quebec, Que., Newton L. Somers, A.M.E.I.C, Sault Ste Marie, Ont., A. E. Foreman, M.E.I.C, Victoria, B.C., H. R. McKenzie, M.E.I.C, Regina, Sask., C. C. Kirby, M.E.I.C, St. John, N.B., Willis Chipman, M.E.I.C, Toronto, Ont. and in the foreground C. E. W. Dodwell, M.E.I.C, Halifax, Chairman of the Committee. A. G. Dalzell, A.M.E.I.C, Vancouver, was present at the early sessions of the committee.

entirely by The Institute; that is, The Institute is unselfishly working in the interests of the whole profession. Other organizations in Canada, comprising professional engineers, will no doubt appreciate the work of The Institute in this connection.

A ballot will be submitted to the members very shortly and the result of this ballot will doubtless determine what action the various provinces will take in connection with legislative enactments.

a special Committee be formed, composed of one

delegate appointed by each branch to meet at headquarters before the 15th of April, 1919, to draw up such sample legislation as it may deem necessary and advisable in order that the members of The Institute throughout the different provinces may ask for legislation on the same uniform basis.

That this Committee be authorized to obtain the necessary legal advice on the matter.

That this Committee shall submit the proposed legislation to the Council before the 1st of May, 1919.

That the Council shall then ask by letter ballot, before the 1st of June, 1919, the opinion of all the members of The Institute regarding the adoption of the proposed legislation prepared by the said special Committee of The Institute.

International Engineering Standardization: International Standardization as Regards Aircraft Parts and Accessories.

The Standardization of Aircraft Materials and Parts formed one of the earliest and most important pieces of war work undertaken by the British Engineering Standards Association, and was taken up when a request was received in June, 1917, from the Society of British Aircraft Constructors, asking for the formation of a Sectional Committee for Standardization in this matter. Such a Sectional Committee was at once appointed, and commenced work in August, 1917. Experience with military aircraft under the conditions obtaining in France, where the air forces of several countries were co-operating, soon indicated the need for a certain measure of International Standardization, not as regards the details of aircraft construction in general, but in connection with such points as affect the utilization, by the aircraft of one country, of spare parts, accessories and instruments belonging to the aircraft of another nationality. To take two examples only, the desirability of a standard series of dimensions for the size and spacing of the holes in the wooden hubs of propellers became evident; and it was further obvious that a great saving of time and expense would result if Allied agreement could be reached on the question of standard specifications for aircraft materials, so that materials purchased in one country to the Government specifications ruling there would be at once acceptable for a similar purpose in Government work in another country.

With objects of this kind in view, an invitation was forwarded by the British Engineering Standards Association to a number of representative authorities in the United States, including the U. S. Aircraft Board, the U. S. Bureau of Standards, the U. S. Navy Department, the U. S. War Department, the American Aircraft Manu-

facturers' Association, the Society of Automotive Engineers, the American Society of Mechanical Engineers, and the American Society for Testing Materials, asking that their delegates might proceed to England to attend an Aircraft Standardization Conference to be held early in 1918. This Conference took place in London in March, and was attended by fourteen American representatives. It considered briefly the differences in British and American Aircraft practice in regard to a great number of topics, such as: "Nomenclature, Timber, Ply wood, Glue, Propeller Hubs, Electrical Parts, Instruments, Ball and Roller Bearings, Sparking Plugs, Magnetos, Wheels and Tires, Structural Tubing, Rigging, Rubber, Dope, Fabric, and Steels; and the American delegates left for the United States with the understanding that a further conference would be called together in a few months, and that in the meantime everything possible would be done to prepare the ground for an agreement.

As a result of the Anglo-American Conference just described, and at the wish of the Ministry of Munitions, it was decided that the various Allied Governments should be approached with a view to the constitution of an International Aircraft Standards Commission, primarily, of course, as a war measure, but looking also to the international questions which are bound to arise in connection with commercial aviation. An Organization Committee under the Chairmanship of Sir Henry Fowler, Assistant Director General of Aircraft Production, drew up a tentative constitution, under which it was suggested that this Commission should be composed of a number of separate National Committees, resembling in this respect the International Electro-Technical Commission. In the case of those countries having National Standards Committees it was felt that their respective Sectional Committees on Aircraft Parts would naturally be selected as the National Committees representing each country on the International Aircraft Standards Commission. The organization of the Commission proceeded on this basis, and its first plenary meetings were held in London in October, 1918, which the writer attended as one of the Canadian delegates. The countries represented were Great Britain, Canada, France, Italy and the United States, the scheme of organization was fully worked out, and a Constitution formally agreed upon (subject, of course, to ratification by the various Governments), after which the Commission proceeded to consider in detail a number of the points in connection with which the necessity for International Standardization had been suggested. International Advisory Committees were appointed to deal with these questions, and it was arranged that their reports should be considered at the next Plenary Meeting of the Commission, to be held in Paris some time in 1919.

JOURNAL OF THE ENGINEERING INSTITUTE OF CANADA

## Notes on "Civil Aviation"

### The Development and Future of Aviation in Canada\*

By M. R. Riddell, Chief Engineer Canadian Aeroplanes Ltd.

One of the most notable features of the late European war has been the rapid development of the aeroplane from a more or less experimental toy to one of the most formidable of the many engines of war employed in that great conflict. Of course it may be that the great development along the special line has been at the expense of development in other directions, but even if this is so it is not too much to say that a tremendous impetus has been given by the war to aerial navigation generally.

As far as Canada is concerned, while a Canadian "J. A. D. McCurdy" was one of the earliest aviators, on this side of the Atlantic at any rate, beyond a little experimental work by Messrs. McCurdy and Baldwin in the early days, under the direction of Professor Bell, nothing was done in the line of aerial development until the spring of 1915.

At that time Mr. McCurdy, who had in the meantime

While the outbreak of the war put a stop to the proposed Transatlantic flight, it was suggested that a large twin engined bombing plane along the lines of the "America" might be constructed. As the Hammondsport and Buffalo plants were crowded with other work, the working out of this new machine was entrusted to the Canadian plant.

The original intention was to have the "Canada," as this machine was afterwards known, practically a duplicate of the "America," but with fuselage and landing gear instead of a hull, and two of the V.X. type 170 H.P. Curtiss motors instead of the smaller ones fitted in the "America." With these more powerful motors it was expected that a speed of 85 miles per hour would be attained as against the 60 miles per hour speed of the "America." Owing to these changed conditions, however, it was found necessary to change almost every part so that

,

'Avro 504-K" Type Training Plane (R.A.F. Serial Number C-1501) Built by Canadian Aeroplanes Limited, Toronto, October, 1918.

become associated with the Curtis Aeroplane Co. of Hammondsport and Buffalo, organized a Canadian company known as Curtiss Aeroplanes and Motors Limited, with headquarters in Toronto. The special object of this new company was the manufacture of aeroplane parts for British orders, but soon much more interesting work was undertaken.

Just before the outbreak of the war a large twin-engined flying boat had been under construction at the Hammondsport works of the Curtiss Co. She was known as the "America," and it had been intended to attempt a Transatlantic flight in her.

This "America " (afterwards known serially as the H-4 type) was the forerunner of the series of large flying boats built by the Curtiss Co. for war service of the Allies. She was of approximately 76 foot wing spread, and was powered with two Curtiss 90 H.P. motors.

\*Read at Ottawa Professional Meeting, E.I.C., Wednesday Feb.

the " Canada " as built was practically a new design throughout.

Actual construction work was begun towards the end of June, 1915, and the first trial flight was made about the end of July. As there had been some delay in the delivery of the V.X. Motors intended for her, for this first trial she was fitted with two 90 H.P. motors similar to those in the "America. " This first flight was successful, the " Canada " showing a speed of upwards of 70 miles per hour with these smaller motors, balancing and handling well.

Some slight alterations were made as a result of this initial flight before she was again tried, this time with her proper motors. On this occasion she had a bad mishap on landing, and was partially wrecked. After repairs she was again tried and this time made a most successful flight, attaining a speed of better than 87 miles 12th.

JOURNAL OF THE ENGINEERING INSTITUTE OF CANADA

201

per hour, with a climb of over 3500 ft. in less than 7 minutes.

As a result of this successful trial an order was placed by the British Government for eleven more machines of this type, with certain modifications that had been found desirable.

In the meantime the " Canada " had been shipped to England, where she underwent a series of further tests. On one of these tests after the motors had been " tuned up," and the stranded wire in the interplane bracing replaced by " stream line " wire of much lower resistance an average speed of 102 miles per hour was recorded.

The " C" machines as these next eleven were known were in general similar to the " Canada " but embodied many refinements and improvements in arrangement and detail.

These " C " machines were duly completed and shipped and work was started on a still further improved

of approximately 350 H.P. and a speed of approximately 100 miles per hour (with streamline wire). The total flying weight with a military 'load of about 1000 pounds, 200 gallons of gasoline and a crew of three, was approximately 7000 pounds. The 200 gallons of gasoline would give a flying radius of between 500 and 600 miles at full power.

While work on the " C's " was at its height a force of about 600 men was employed.

After work on the " C-2's " was stopped, as noted above, the manufacturing activities of the Curtiss Aeroplanes & Motors Limited, were considerably curtailed, the manufacture of spare parts for British Buffalo orders, and the construction of some training planes of the JN-3 type as well as a few hydro aeroplanes for a foreign government, being all that was undertaken until the decision of the British authorities to establish training squadrons in

"JN-4" Type Training Plane (R.A.F. Serial Number C-101) Built by Canadian Aeroplanes Limited, Toronto, January 1917. (First Machine Turned Out by C. A. L.)

type to be known as the " C-2," when instructions were received (in June 1916) to cancel the order for " C-2 " machines and stop all further work on the type.

What probably caused this decision on the part of the English authorities was the trouble that had been experienced with the V.X. type of Curtiss motor ; also at that time reprisal raids were not in vogue, and the cry was for small machines of very high speed for scouting and fighting.

It seems a pity, however, that none of this " Canada " type were ever used in active service. At the time of their production (late 1915 and early 1916) they were probably quite the best machines of the type in existence, although of course not equal to later larger and more powerful machines of the same general type such as the Handley Pages.

The " Canada " and the " C's " were twin-engined biplanes, with a maximum wing spread of 76 feet, engines

Canada changed the general aeroplane situation considerably.

From the date of its incorporation Curtiss Aeroplanes and Motors Limited had maintained a flying school for the training of cadets for the air services, which although officially recognized by the British Government, was conducted as a private concern along purely civilian lines.

Pupils first of all received instruction on flying boats and after they had attained sufficient skill on these the course was completed on land machines of the training type. Many aviators were turned out who afterwards won distinction in the air services and the attention of the British Government was called to the fact that not only was there much excellent human material available in Canada, but the Canadian climate was such as to afford a greater number of possible flying hours, during the spring, summer and fall at any rate.

202

JOURNAL OF THE ENGINEERING INSTITUTE OF CANADA

On account of these considerations it was decided to establish extensive training fields in Canada.

For this training, in order to obtain machines quickly it was decided to use the JN type, similar to those employed by the Curtiss School, and an order for a large number of JN-4's (the latest model of the JN type at that time) was issued.

In connection with the order a new firm under the auspices of the Imperial Munitions Board was organized to undertake the work of manufacturing these planes and others which might subsequently be required, as it was felt, rightly or wrongly, that there was no private enterprise existing capable of handling the proposition satisfactorily.

This new firm was known as Canadian Aeroplanes Limited and was under the direction of F. W. (now Sir Frank) Baillie.

Canadian Aeroplanes Limited acquired the manufacturing business of Curtiss Aeroplanes and Motors Limited, except the business of manufacturing parts for the Buffalo firm, and immediately proceeded with the work of turning out the JN-4 machines.

Limited would not be nearly large enough to produce a sufficient number of machines in a reasonable time, and steps were taken to erect a new plant specially for the purpose. A site was chosen, and work was started about the beginning of February. The construction was pushed so rapidly that by May the transfer to the new plant was practically complete.

With some extensions subsequently added the new buildings provided a floor space of approximately 235,000 sq. ft. or about 514 acres.

The manufacturing equipment was most complete and provided for the production of practically every part of an aeroplane with the exception of the motors and instruments such as tachometers, gauges, altimeters, etc.

A well equipped testing department provided for the testing of all raw materials as well as finished parts; and a research department allowed experiments to be made on the proper heat treatment for various metal parts, the qualities of various samples of dopes and paints, etc.

While production was pushed to the limit, all materials and workmanship had to run the gauntlet of the testing department, the company's inspection department

"JN-4" Type Training Plane C-318 (Fitted with Snowshoes), February 1918.

The Curtiss Aeroplanes and Motors Limited continued their work of manufacturing spares for British Buffalo orders.

The greater part of the engineering and manufacturing staffs of the Curtis Aeroplanes & Motors remained with the Canadian Aeroplanes Limited.

Before beginning production of JN-4 machines on a large scale, it was found desirable to make some slight changes from the Buffalo design. The bridge type of control with which the Buffalo machines were fitted was changed to the more usual " joy stick, " metal construction was adopted for the rudder, elevators, and fin, and the design of the tail was altered so as to give better " stream lining " and reduce risk of damage in landing. The first machine was completed on January 1st, 1917, and was taken out to the Long Branch flying field for test. The trial flight was very successful, the machine was officially accepted, and production work was started in earnest.

It was soon evident that the premises occupied by the old Curtiss Aeroplanes & Motors Limited which had been taken over by Canadian Aeroplanes

and the A-I-D, or government inspectors, the result of all this care being that as far as I have information no accident ever occurred with one of our machines that could be traced to defective material or workmanship.

The production records climbed steadily from month to month, slowly at first, then by leaps and bounds until we reached a record of 318 machines in one month by the end of 1917. This result was achieved with a force of about 2500 men, and is a better figure than has been reached on a similar class of work with a similar number of employees anywhere else, as far as I have information.

At this rate the requirements of the Royal Air Force were soon supplied, and we were able to furnish the U. S. training fields with a number of training machines as well.

The total number of JN-4 machines turned out was approximately 1300 and spares sufficient to make the production equal to approximately 3000 complete machines in all; of these, 680 were furnished the U. S. fields.

The JN-4 is of course quite obsolete as a military machine, but has proved very satisfactory for training

203

purposes. There are several variations of this model differing in details, but the Canadian JN-4 is a two-seater biplane of 44 feet wing spread (upper plane), flying weight about 2100 pounds, and fitted with a Curtiss OX motor of 90-100 H.P. The speed is about 70 miles per hour.

While the production of the JN-4 was proceeding, an experimental machine of another type was turned out in the experimental shop. This was the De Haviland 6, a training plane that had been used to a considerable extent in England and which at one time it was proposed to substitute for the JN-4.

This DH-6 was tried out in July, 1917, and was found satisfactory, but by this time production was swinging nicely on the JN-4's, they had proved very suitable for the purpose and it was felt that to change over to the DH-6 would unnecessarily delay the output of machines. No more of this type were therefore built.

The DH-6 is a two-seater biplane of about 36 feet wing spread, both upper and lower planes being alike, flying weight about the same as the JN-4. The DH-6 was designed for a R.A.F. engine of 90 H.P. The one in

There is a wireless cabin in which is fitted a wireless set with a sending radius of about 25 miles and a receiving radius of about 1000 miles.

The engines, armament, bombs, wireless outfit, telephones, etc., were supplied by the U. S. Navy Department, but we had to make provision for the installation.

The construction of the first boat of our contract was commenced on April 22nd, 1918, and the boat was completed by July 15th, shipped to Philadelphia, and successfully tried out.

We afterwards worked up to a production of eight boats per month.

While the contract for F-5 boats was getting under way in the shops work was started on another type of machine for the R.A.F. training fields. While the JN-4 had been found suitable for general training, it was somewhat too slow, and was not sensitive enough to control

## Notes on "Civil Aviation"

for advanced work, so that cadets trained in Canada had to take additional training before proceeding to work on actual war machines.

Shipment of Canadian "JN-4" Training Planes to U. S. Training Fields. Mid-winter 1917-1918.

question was fitted with the same motor as used in the JN-4, and the speed was around 65 miles per hour.

The DH-6 is interesting as having a type of wing suitable for carrying heavy loads, at moderate speeds, the section being much more deeply cambered than that used in the JN-4, which was a modified form of Eiffel No. 36, a good general purpose curve.

When the wants of the R.A.F. had been satisfied for the time being, and there seemed a likelihood of a temporary lull in production a contract was obtained from the U.S. Navy for 50 flying boats of the new F-5 type. This boat had been developed at Felixstowe, England, and found the most suitable for patrol and anti-submarine work.

It is a large twin-engined boat, of about 102 ft. wing span, a total flying weight of around 14,000 lbs., and a speed, fitted with two 400 H.P. Liberty 12's, of about 100 miles per hour. Its length from nose to tail is about fifty feet. Its armament consists of between four and six machine guns, one Davis six pounder, and four 230 lb. bombs which are hung on racks under the wings.

The crew numbers six men, and a system of inter-communicating telephones is fitted.

To avoid this it was decided to equip certain training squadrons with the "Avro " 504-K training plane which was in use in England.

The "Avro " 504-K is a biplane of 36 feet wing spread, both upper and lower planes having the same span. It is of lighter construction and considerably greater refinement of design than the JN-4, while the wing section is one adapted for higher speeds. With these differences the "Avro is a considerably faster machine, the original machines of this model, which appeared in 1915, and were used to some extent at the front, having a speed of 90 miles per hour with an 80 H.P. Gnome Motor.

As a training machine the " Avro " 504-K is adapted to be fitted with seven different types of motor. For the Canadian training squadrons the "Avro " was fitted with

130 H.P. Clerget Motors, which were shipped out from England for the purpose. With this motor a speed of upwards of 100 miles per hour has been obtained.

It was found advisable to make some minor changes in the design on account of difficulty in obtaining material, and in order to reduce the number of spares necessary, by making certain parts interchangeable with corresponding parts of the JN-4. Thus the landing gear was

204

#### JOURNAL OF THE ENGINEERING INSTITUTE OF CANADA

completely redesigned, a V-type being used instead of the regular "Avro " type.

These changes caused delay and while the first machine of this type was delivered by October 1st, production was really only beginning when the armistice was signed and work stopped. We delivered only two machines of this type in all.

With the conclusion of the armistice the activities of the Canadian Aeroplanes came to an end, the R.A.F. order for 500 "Avros " being cancelled immediately and the U. S. contract for F-5 boats being cut from 50 to 30. The distasteful task of gradually discharging the staff of workers was immediately begun and by the end of January, 1919, when the F-5 contract was finally completed, the working force had been entirely disposed of except such office and other help as was necessary to complete the sale of the tools and fixtures, and the huge buildings lately so thronged with busy workers now stand empty and still.

The Curtiss Aeroplanes and Motors Limited which had been working on a contract for F-5 boat spares, has also discontinued aeroplane work, but has been able to retain a portion of its staff on another line of manufacture.

As will be seen from the foregoing the aeroplane industry of Canada during the war grew from nothing to very respectable dimensions. A large number of workmen were employed not only in the aeroplane factories, but also in supplying raw material " such as spruce lumber " and large numbers of machines of different types were successfully turned out. The quality of the workmanship in these machines was certainly equal to that found anywhere else, and the production records were unsurpassed. Canada has no reason to feel ashamed of her part in supplying the aeroplane needs of the Allies.

It is not possible to make more than a passing reference to the work of the R.A.F. in Canada. The complete account of this work is now being prepared in book form by the historical department of the R.A.F. and will shortly be issued.

It will be sufficient to note that as a result of the activities of the R.A.F. in training aviators, and of the firms building aeroplanes, there are now in Canada a large number of skilled workmen ready to produce aeroplanes and of skilled aviators ready to fly them when built.

Sand Bag Loading Test on Vertical Fin, Canadian "JN-4," May 1917.

"De Haviland 6" Type Training Plane Built by Canadian Aeroplanes Limited, July 1917.

Now that war activities are over the question naturally suggests itself "is the aeroplane destined to play a useful part in the industries of peace, or is it to rank in the future as in the past, as a purely military machine, with possibly an occasional one used here and there by an enthusiast for purposes of sport ?

A careful study of the question would seem to bring one to the conclusion that there are at any rate several directions in which aeroplanes could be usefully employed apart from war purposes, and in what follows an attempt will be made to show what these appear to the writer to be.

It may be taken for granted that aeroplanes will still be required as a part of the equipment of the armed forces of the country. There are good people who tell us that there will never be another war and, therefore, no more armies or armaments are necessary.

Such statements always remind me of a passage in Scott's "Guy Mannering" where the sturdy yeoman, Dandie Dinmont is warning an English traveller against the dangers of the border wastes, and the female keeper of the wayside inn declares that there is no danger now, as they're all honest on the borders. Dinmont replies:

"Aye Tib, that'll be when the deil's blind, and he's e'en no sair yet."

The country that neglects to keep its air service up to date and ready for immediate service will probably have to pay a terrible price sooner or later. Air raids in the next great war will be carried out by larger and more powerful machines used in vastly greater numbers than in the present war, and the country that is not in a position to defend itself from such attack, and loses the control of the air above its territories will be by that very fact defeated.

It seems, therefore certain that a considerable number of planes will be required for military purposes. But while this will, I believe, be the case, I am convinced that it is equally true that if the aeroplane industry is to develop to any respectable dimensions, it will have to be along commercial rather than military lines. This brings us to the question, is the commercial development of the aeroplane possible ?

#### JOURNAL OF THE ENGINEERING INSTITUTE OF CANADA

205

This is the problem that must be solved by businessmen and engineers working together if the aeroplane industry is to be a factor in the commercial life of the country.

The war has developed, in general, the following types of machines:

- (a) The small fast scout plane, of very high speed and small carrying capacity, generally a single seater as the Spad, the Sopwith Camel, the SE-5, etc.
- (6) The larger and more powerful general purpose machine of high speed and fair carrying capacity generally a double-seater, as the DH-4.
- (c) The still larger bombing plane, generally at least twin-engined, of somewhat lower speed, but great carrying capacity as the Handley Page, the Super Handley Page, the DH-10, the Caproni, etc.

probably choose a " tank " as a motor vehicle for pleasure or commercial purposes.

In this connection it is interesting to note that the attempt to use DH-4's built for war purposes in the U. S. as mail carrying machines, has so far proved a failure, while machines specially built or adapted for mail carrying " the JN-4 type with the 150 H.P. Hispano Suika motor and the R-4 with the Liberty 12" have been very satisfactory.

For commercial uses more rugged construction will probably be found desirable, particularly with reference to parts affected in landing " greater reliability, and longer service without overhauling in the case of motors. As the attaining of a very high ceiling will not in general be necessary, lower compression pressures could be used satisfactorily, this, with somewhat heavier construction

"Avro 504-K" Type Training Plane C-1502. Last Plane Built by Canadian Aeroplanes Limited

for R. A. F. November 1918.

(d) The flying boat for naval service, the largest types of which as the F-5 or NC-1 are of large carrying capacity, and in general correspond to the large bombing planes.

(e) The training plane, moderately sized, moderately powered, fairly slow and comparatively easily handled as the DH-6, the JN-4, the "Avro " 504-K, etc.

It seems probable that none of these war types at present in use will prove permanently satisfactory for commercial purposes without considerable alteration; in other words an aeroplane for commercial use will probably have to be specially designed for a particular class of service in order to prove satisfactory.

This is not remarkable nor are these considerations confined to aeroplanes. A warship would not make an efficient passenger or cargo vessel, and none of us would

would tend to greatly increase the serviceable life of the motors. It should be constantly remembered, however, that increased weight in construction of plane or machinery cuts down the available load capacity.

The peace development of the aeroplane will probably be along the following general lines :

(a) Machines for sporting or pleasure purposes.

(6) Machines for what are generally termed " commercial " uses, including:

1. Machines for mail carrying;
2. Machines for carrying passengers and freight;
3. Machines for special purposes.

With regard to the use of aeroplanes for sport or pleasure, a considerable development may reasonably be expected

206

#### JOURNAL OF THE ENGINEERING INSTITUTE OF CANADA

along this line but of much smaller dimensions than has occurred in the case of the pleasure automobile.

The reasons are several, perhaps the chief being the aversion that so many have to leaving the safety of terra firma. One may produce facts and figures to prove that flying is really very safe " as for example that the mail carrying planes between New York and Washington during the months of September and October flew over 22,000 miles and carried over 30,000 lbs. of mail in all weathers without serious accident and with only one forced landing " but a certain number will always remain unconvinced.

Another drawback is the space required for taking off and alighting which certainly limits if it does not entirely preclude the use of aeroplanes in crowded quarters such as cities. Improvement in this respect will probably be

It is practically certain, however, that a five-passenger machine will never be available at anything like the price of a " flivver."

Coming now to the purely commercial machines, those engaged in the transportation of passengers, mail and freight, while reliable data as to running costs of aerial transport under peace conditions are not available, nevertheless it is possible to form some fair estimate of the conditions under which it will be possible to compete with other established means of transport.

In long settled territories where competing methods of transport, such as railways, steam or electric are well developed, the governing advantage of aerial transport

will be speed. As the aerodromes will probably have to be located on the outskirts of cities, some time will be lost in conveying passengers or freight from the collection

made, and already a successful landing has been made on the roof of a building, but this objection will probably remain, more or less.

Another factor is that of cost. Such machines as were available before the war, cost in the neighborhood of \$7,500.00 at least, and required the constant attention of skilled mechanics to keep in flying condition — they were at best rich men's toys.

Just at present and for some time there will probably be available numbers of machines which have been built for war purposes, at sacrifice prices, but the upkeep cost of these machines will probably be considerable, and in any case the supply will soon be exhausted.

Since the war several firms have turned their attention to producing small one-man planes of moderate size and power, and with a reasonable first and upkeep cost. Several of these are advertised to sell around \$2,500.00.

point to the aerodrome. It follows, therefore, that there must be some minimum distance below which the advantage of speed will not exist, and as distances become longer the advantage of aerial transport in this respect will become more apparent. For short distances, therefore, it would seem that aerial transport is not likely to be commercially possible.

The absence of the necessity for a track gives the aerial transport system a great financial advantage, nor will this be nearly offset by the cost of necessary landing grounds at reasonable intervals, wireless installations, weather reporting services and signalling systems, to indicate routes by night or in fog.

Another advantage of the aerial transport lies in the fact that as compared with a railway train an aeroplane is a small traffic unit, and urgent traffic can be handled by a succession of planes from the aerodrome as the occasion arises, with time economy over the train which requires longer intervals between units to allow of the accumulation of sufficient load for a unit.

Considering now specially passenger traffic, this divides itself into two general classes, business and pleasure. At first the greater part of the passenger traffic will be business. On account of the higher speed of the aerial service, many business men will no doubt avail themselves of it, because although the fares will be higher, this will be more than offset by the economy of time.

For instance, it will be possible, under favorable conditions, to fly from 400 to 500 miles out and home within the day, with sufficient time between flights for transaction of reasonable business.

## Notes on "Civil Aviation"

Passenger service will probably begin by the use of single machines for rapid journeys in any direction, but later it will become possible to institute regular services along settled routes on scheduled time.

Pleasure traffic will probably be small in volume for some considerable time, and will be confined to those taking a trip for the novelty of the experience.

have to be supplied, and the method of entrance will have to involve less or an acrobatic performance than at present. This will mean added weight and the reduction of the passenger carrying capacity, but these changes will, in the writer's opinion, be found necessary if trade is to be secured.

Freight traffic will include :

- (a) Mails.
- (b) General Freight.

In mail carrying commercial conditions do not necessarily rigidly apply " in other words national considerations might demand that the use of aircraft should be developed, and in this case it might be good national business to bear part of the cost of an aerial mail service with this object in view.

Mails offer a very satisfactory class of freight for aeroplane carriage, because the load is fairly uniform, the weight small, and the demand for speed urgent.

For the longer distances the saving in time in the delivery of mails by aeroplane will be enormous " for instance it is estimated that mail could be conveyed from

l 'F5L" Type Flying Boat, Built by Canadian Aeroplanes Limited, Toronto, for U. S. Navy.

under Test at Navy Yard, Philadelphia, August 1918.

First Canadian Boat

As the safety and convenience of this method of travelling becomes more apparent, this traffic will increase in volume.

For passenger traffic two points will require special attention, safety and comfort. Safety, in fact, will have to be a primary consideration if support from the travelling public is expected. In this connection it may be noted that commercial machines can be made inherently stable and automatic stabilizers can be employed to an extent that has not been practicable in war machines " so that it would appear that commercial machines could be made aerodynamically much safer than the present war types.

In use they will not be subjected to the severe and somewhat indeterminate stresses due to " stunting," and, therefore, for the same calculated factor of safety, they will really be structurally much safer.

The question of comfort will also require much attention. The travelling public will demand a much greater degree of comfort than is available in present machines. Some form of comfortably enclosed cabin will

London to Calcutta in four days against 16 days, the best possible at present.

Considerable experimental work has been done already along this line, and the results have in general been so satisfactory that in the immediate future the existing services will be greatly extended.

When we turn to the consideration of other freight, conditions are not quite so favorable. If reasonably high speed (which has already been noted as the principal asset of aerial transport in competition with other methods) is to be maintained, then the commercial load must not exceed approximately 25 per cent, of the total weight of the loaded aeroplane.

It would, therefore, seem that the class of freight that can be commercially handled by aeroplane in competition with other means of transport, will be limited to articles of high intrinsic value and small weight, or articles which are specially "rush." For instance, laces, jewels, precious metals, tea samples, drugs, dyes, chemicals, small spare parts of machines, etc.

208

#### JOURNAL OF THE ENGINEERING INSTITUTE OF CANADA

For this class of service it would seem that aeroplane transport could only hope to act as auxiliary to surface methods of transport.

In undeveloped parts of the country where there are no established competing methods of transport, aerial transport, providing as it does ready means of reaching points previously practically inaccessible, will show to much greater advantage, and offers proportionately a better commercial proposition. Of course, the volume of such traffic will probably not be large.

In cases where traffic from one place to another is interrupted by some obstacle involving changes in the method of surface transport "such as a sea passage" aerial transport scores a great advantage.

This brings us to an exceedingly interesting question, namely, that of Transatlantic, or perhaps it would be better to say Transoceanic Aerial Service.

While we may reasonably expect a successful Transatlantic flight to be made by aeroplane or flying boat in the near future, possibly this coming summer, it seems probable that when regular aerial service over the Atlantic and other oceans is established, the aeroplane will not be

the type of air vessel generally employed. For work of this kind, as well as for long flights overland, involving several days duration, the lighter than airship of the Zeppelin type appears to offer superior advantages in the way of comfort and safety. As compared with an aeroplane, the largest types of dirigible at present in existence have a gross weight of 60 tons with a disposable load of 30 tons "about nine times that of the largest existing type of aeroplane.

The maximum speed possible is probably not over 70 miles per hour as against about 100 miles per hour for the large type of aeroplane adapted to similar service, but even this is much higher than that possible at present with steamships. The large load carrying capacity makes possible the provision of much greater comfort for passengers, and with respect to safety, the breakdown of the machinery would not necessitate immediate landing "a factor of some importance in crossing a large body of water. Minor breakdowns could no doubt be repaired in the air and the journey continued without landing. On the other hand provision for landing and housing at the terminal points would probably be more expensive than in the case of aeroplanes, and the regularity of the service would probably be more adversely affected by bad weather.

Applying this discussion to Canada, this country seems to offer particular advantages for the establishment of aerial transport. Large portions of it are in the undeveloped state as regards transportation facilities. The use of the aeroplane would enable mail and express package freight as well as passenger service to be extended to points at present practically inaccessible, or in other words places which it takes days or weeks to reach under present conditions could be reached in a few hours by aeroplanes.

The development in Canada is likely to be first of all along the lines of a postal service. This will enable considerable experience in commercial flying to be obtained, and will familiarize the mind of the public with the idea of aerial transport, thus creating confidence. It is the lack of confidence on the part of the average

man in the safety of aerial travel that is, as stated before, one of the most serious, if not the most serious difficulty in the way of development. This has been created by reading in the public press highly coloured accounts of fatal accidents ; where these are considered by themselves, without reference to the peculiar circumstances under which most of them occurred (the intensive system of training in all kinds of stunt flying necessary under the late war conditions), and also without reference to the proportion of accidents to flights, an altogether exaggerated and distorted idea of the dangers of flying is created.

When public confidence in flying is once fairly established, the writer ventures to predict that development of aerial transportation systems along the lines suggested will be rapid.

In the meantime, research work in aerodynamics should be pushed, and it is gratifying to know that several of our universities are already taking the matter up.

## Notes on "Civil Aviation"

A great many other problems will have to be dealt with as flying becomes more common " for instance, the establishing of flying rules of the road; questions with relation to trespass and liability in case of accident incurred in flying over private property; the determinations of the best air routes; custom problems, etc.

All this will take time; but it will be done and the writer is firmly of the opinion that in a comparatively short time flying will be so common as not to excite comment, and no one will think anything of travelling from Toronto to Montreal in about three hours or from Toronto to Winnipeg in ten.

When long distance flying becomes common, it will probably be found necessary to have stores of the spare parts most likely to be required, such as propellers and various engine parts, at conveniently located depots along the courses of travel. In the event of a mishap to any of these parts, repairs could then be quickly made, and the journey continued. On account of the weight it would not be feasible to carry spares (except small parts such as spark plugs, etc.) on board as is done in the case of a steamship. It is in this connection especially that standardization of parts of aircraft will prove so valuable not to say essential, more particularly with reference to international aerial services.

There remains to be considered special uses to which aeroplanes can be put.

One field in which it would appear that useful service could be rendered is that of fire patrol of forests. Destructive bush fires are very small at the beginning, and if immediately detected could be easily dealt with. A fire ranger from an elevation of say 5,000 feet could command a view of a wide stretch of territory and could detect the first signs of a fire.

For this service in Canada it is probable that the small flying boat or at any rate a hydro aeroplane (aeroplane fitted with pontoons instead of wheels) would be found best.

The writer has had survey experience in Northern Ontario and Quebec and can state that as far as his personal observation goes, possible landing grounds for aeroplanes are few and far between. On the other hand

### JOURNAL OF THE ENGINEERING INSTITUTE OF CANADA

209

there are innumerable small lakes and rivers on which a small flying boat could alight in safety and from the surface of which it could take off.

Flying boats could also be employed in connection with life saving stations along our coasts, and in general coast patrol work.

A question which might reasonably arise in connection with the use of aeroplanes in all seasons in Canada is the question of rising from or alighting on a surface covered with snow, especially if the snow be soft, and of considerable depth. It is obvious that in the case of a machine

## Notes on "Civil Aviation"

equipped with the ordinary landing gear with wheels, a depth of soft snow might so impede its progress on the ground that it could never reach a flying speed, particularly

1917-1918 much flying was done with them. It was even reported that a machine equipped in this manner took off and landed on a snow surface more easily than a wheel equipped machine on ordinary ground.

In fact so successful was the experiment that it had been intended during the winter of 1918-1919 to do the bulk of the training work at the Canadian Camps, and a large number of these snow shoes were ordered from Canadian Aeroplanes Limited. This order was partially completed at the time of the armistice.

From the experience of the R.A.F. therefore, it would appear that as far as snow conditions are concerned aeroplane service could be maintained throughout the winter.

D. O. LEWIS, M.E.I.C., Victoria, B.C.  
Newly elected Vice President.

WALTER J. FRANCIS, M.E.I.C., Montreal.  
Newly elected Vice President.

in the case of a heavy machine. At the time when the R.A.F. established training squadrons in Canada it was considered so difficult if not impossible to continue flying under the ordinary conditions of a Canadian winter, that for the winter of 1917-1918 the bulk of the training camps were transferred to the South, only a small number remaining, more as an experiment than anything else. Experience proved that while a take off or a landing could be effected without special difficulty from a hard snow surface, there was always the possibility of one of the wheels striking a soft spot, when a spill was practically certain.

Then it was suggested that snow shoes or " skis " might be fitted instead of wheels. This was tried on several machines, and proved so satisfactory that a considerable number of machines were at once equipped with these " skis " and during the later part of the winter

## Notes on "Civil Aviation"

As commercial aerial service extends, new uses for the aeroplane will be continually found and in a comparatively small number of years instead of considering it as an interesting but somewhat impractical toy, flying will have become a matter of everyday life, and we will wonder how we ever got along without it.

As a result of the higher speed possible with aerial transport, nations will be brought in closer intercourse with one another, mutual understanding promoted and the possibility of international conflict lessened, so that while the aeroplane has proved it can serve its turn in war, it will also prove that it can help to bring about the condition wished for by the poet: "â€œ"

" Now let us pray that come it may  
As come it will for a' that  
That man to man the world o'er  
Shall brithers be, for a' that.

*The Civil Service Commission of Canada* : hereby give public notice that *applications will be received from persons qualified to fill the following positions in the Civil Service of Canada* : " [...]

*Selections for eligible lists of applicants qualified to fill similar vacancies* which may occur in future may *be made from applications for these positions.*

*According to law, preference is given to returned soldier applicants, possessing the minimum qualifications.*

Return soldier applicants should furnish a certified copy of their discharge certificate.

In the case of positions numbers [...] preference will be given to residents of the provinces in which the vacancies occur.

Application forms, properly filled in, must be filed in the office of the Civil Service Commission not later than [...] Application forms may be obtained from the Dominion-Provincial Employment Offices, or the Secretary of the Civil Service Commission, Ottawa.

By order of the Commission,  
Wm. Foran,  
Secretary.  
Ottawa, May 8th, 1919

JOURNAL OF THE ENGINEERING INSTITUTE OF CANADA pg 339 - An Experienced Transition : Adaption of the Hydroplane to Exploration

Editor, Journal:

It has occurred to me that while the Press of our Country has been advocating the use of the hydroplane as a quick and efficient means of forest protection and conservation that there still exists a far larger field for its use than this alone, by this I mean that when a new idea is launched it should cover its uses in general more than in particular, forestry in this case will be only a branch.

Knowing the use of this new arm from experience overseas, I naturally am deeply interested in the subject. Incidentally as an engineer with a fair experience of conditions in our Great North, I would like to suggest the many other ways in which the hydroplane could be of use insofar as the development of the great resources of our north country are concerned:

Let us, for instance, consider the question of research, geological, hydrographic and agricultural. The sending of expert engineers by hydroplane, from an established base, say, Lake St. John, with the oblique photograph apparatus in common use in the theatre of war, which on the machine at an elevation of 1000 feet, can take a picture, showing the

## Notes on "Civil Aviation"

general lines of the country: lakes, mountains and rivers, with a vertical base of say, 500 yards, extending forward and outwardly for 6 miles, with the possible upper base of 6 miles, giving a very fair idea of the elevation and contours of the country.

The landing can be made upon our numerous lakes in that region which to my general knowledge, are never farther apart than a matter of 10 miles. Tests of soil such, for instance, as planting grain, corn, etc., the exploration of the geological formations, the sizing of water-powers, and the examination of fisheries, etc., can be made all of which would be invaluable data, to the provincial department of research. Also from the lumberman's point of view the examination of valuable timber and protection thereof, and a great many other things too numerous to mention.

The sister province, Ontario, I must say, has given an example of progressiveness insofar as the exploration and exploitation of their north country is concerned. It is a matter of common knowledge the great benefit that has been derived by the building of the Temiscamingue and Northern Ontario Railway, for the Ontario Government ; and the projection of the Transcontinental Railway through the Abitibi, and the subsidizing of the Algoma Central, all of which have more than repaid their sponsors by opening up the great mine fields of Cobalt, Porcupine, and the fertile, clay-belt of the Abitibi.

Why could not this Province of ours, in view of the great demands which will be made by all returned soldiers for large public expenditures, not open a new railway for the development of our own north country, which is, no doubt, as rich as that of the sister province. There is very little doubt that such an investment would not only please the public, but would be an investment in the fullest sense of the word, and would bring magnificent results. It is a well-known fact that the credit of the country depends on its natural resources, but these natural resources must be in view and not in imagination.

A practical way of proving these resources is by practical development. Heretofore, railway construction in the north, far from its base of supplies, has been a very serious problem; the country being virgin, and more or less, unknown, and distances great. It is obvious that, adapting the hydroplane to this particular branch of engineering would reduce the preliminary cost of survey by 50 p.c. and likewise reduce the duration of these surveys by at least the same amount. For instance, it is proposed to build a line from St. Felicien and Lake St. John, to that lake of mystery, called Mistassini. I roughly calculate the distance at 200 miles. With a base at St. Felicien, and using a small light Curtiss machine equipped with the oblique photograph apparatus (45 degrees), a reconnaissance survey could easily be made ; and in the course of a month, with the data supplied by these photographs, a location could be tried, which, I am of the opinion, would fit in.

The extent of line generally allotted to each party of engineers on this work, is roughly from 40 to 50 miles long; each working towards the other, so as to join up. On determining the line to be followed, from the reconnaissance survey, how easy it would be to place each party at the desired point where their survey is to commence by means of the hydroplane working from the base. The parties could also be supplied with provisions by the same method. In other words, I believe the aeroplane has arrived to stay, and is bound to revolutionize the old methods of the location engineer.

Again, the outline of our lakes, outlets and inlets in the north are in a large number of cases so imperfectly explored and known, that one can get but a vague idea from Government maps of what really exists there. All these could be quite clearly outlined and recorded, in exact position, by means of the hydroplane at a high altitude, using a photographic apparatus with telescopic lamps.

The machine that could be used for this purpose, would be the Curtiss biplane, carrying two men with a cruising radius of 4 hours, and a speed of 75 miles per hour, minimum, at the cost of \$7,000.00 per machine. For transportation purposes, the Caproni triplane, which is manufactured in the United States, can carry 20 men, or 5000 pounds at the speed of 85 miles per hour, with a cruising radius of 5 hours, and costing \$ 7,000.00.

Another advantage which must be considered is the employment of our young men who are returning from overseas, who have qualified as pilots and observers in the Royal Flying Corps. It is needless to say that much time and labor, beside expense, has been devoted to the training and development of these men, which expert knowledge should bring some results for the benefit of the country which has trained them.

## Notes on "Civil Aviation"

In conclusion, I believe that a general idea has been given of the advantages of the aeroplane in the development of new countries, but it has been general more than technical. This is a matter that, if my suggestion should be favourably considered, could be gone into in detail, I am sure, to the satisfaction of interested parties.

Yours truly,

Lieut.-Col., R. De La Bruere Girouard, A.M.E.LC.

**October 26th, 1916 : Flight Lt. Franklin Sharp Rankin, R.M.C., S.E.I.C. (Student member, Engineering Inst. Canada) killed in action above Bapaume**

Franklin Sharp Rankin:-

born in Woodstock, N.B., on July 31st, 1894

graduate of the 1914 class of the Royal Military College and

enlisted in the early days of the war at the age of nineteen.

Typical of the huge class of Canadians who engaged with the Royal Air Forces and did so much to make the British Air Forces live in all history.

In reply to a letter addressed to his father concerning his son's record, Dr. Rankin writes: that the facts are all summed up by saying "he went and stayed"

The following letter was sent by Colonel G. J. Carmichael, 18th Squadron Royal Flying Corps, to Dr. Rankin:

He was one of the pluckiest fellows I have ever had in my Squadron, and I am sure he met the death he would have chosen.

He was doing escort to a photographic plane well over the German lines.

First they attacked three hostile machines and drove them off.

They then attacked three more, sending one down in flames, and the second glided down emitting smoke, evidently having been hit in the engine.

He was standing up firing over the top plane, firing at the third machine, when a bullet hit him in the head.

It was a grand fight against long odds, and it was a splendid death.

I am most awfully sorry to lose him;

He had done a long spell of good work and had taken part in a good many scraps.

Only two days before he was in a big melee, and shared honours over a machine that fell in our lines.

He was always out for a fight, my only apprehension was that he would overstep the mark.

His pilot and he together took an awful lot of straffing.

He is a great loss."

A Flying Corps' communique gives the following account of Lieut. Rankin's last engagement:

On the 23rd October, 1916, Sec. Lieut. F. L. Barnard (pilot) , with Lieut. F. S. Rankin (Pilot or Obs or both ?) , No. 18 Squadron, engaged seven hostile machines near Bapaume.

Two of the enemy were hit and one of them went down out of control.

During the engagement Lieut. Rankin was killed, *and the machine badly damaged*.

Sec. Lieut. Barnard had some difficulty in returning to our side of the lines."

Colonel W. W. Melville, under whose command Lieut. Rankin, went to Europe, wrote as follows:

Your son was with me eighteen months and I became very much attached to him.

Individually *he was* the soul of honour, *absolutely without fear*. [...]

In all my communications with him he treated me very courteously and with respect, and had he been my own son he could not have given me better support.

His work was splendid, and *having a splendid physique he was able to do the work of two men*,

I regret very much that he has not been permitted to live."

Lieut. F. L. Barnard, his pilot, writes to his mother;

*Rankin, was by the far the most daring and reckless man in the R.F.C. that everyone, without exception, was frightened to go (flying) with him.*

*His one aim and object was to get German blood and whether he ever returned or not was a mere trifle.*

He had been shot down three other times, and was truly on the war path.

One day we were out together and flew over a German air cadet school, that are so strongly guarded that no one would have a ghost of chance if they were ever attacked, and Rankin was determined to fly low and drop bombs on it, but I would not go, and after that I was even more unwilling to go with him, but the day the Germans attacked with seven planes, though I had hated to go up, yet *my first thought when the Germans appeared was*, thank Heaven, it is Rankin

## Notes on "Civil Aviation"

and no one else, and *had anybody else been at the guns neither of us could have lived a minute*, as it was, Rankin was as cool as though we were toasting our toes by the fire, and would not leave at all, but kept the place guarding the photographing plane until it got safely away."

### Preliminary Notice of Applications for Admission and for Transfer

20th October, 1919.

The By-laws now provide that the Council of the Institute shall approve, classify and elect candidates to membership and transfer from one grade of membership to a higher.

It is also provided that there shall be issued to all corporate members a list of the new applicants for admission and for transfer, containing a concise statement of the record of each applicant and the names of his references.

In order that the Council may determine justly the eligibility of each candidate, every member is asked to read carefully the list submitted herewith and to report promptly to Secretary any facts which may affect the classification and election of any of the candidates.

In cases where the professional career of an applicant is known to any member, such member is specially invited to make a definite recommendation as to the proper classification of the candidate.\*

If to your knowledge facts exist which are derogatory to the personal reputation of any applicant, should be promptly communicated.

Communications relating to applicants are considered by the Council as strictly confidential.

\*The professional requirement are as follows:

Every candidate for election as MEMBER must be at least thirty years of age, and must have been engaged in some branch of engineering for at least twelve years! which period may include apprenticeship or pupilage in a qualified engineer's office or a term of instruction in some school of engineering recognized by the Council.

The term of twelve years may, at the discretion of the Council, be reduced to ten years in the case of a candidate who has graduated in an engineering course. In every case the candidate must have had responsible charge of work for at least five years, and this not merely as a skilled workman, but as an engineer qualified to design and direct engineering works.

Every candidate for election as an ASSOCIATE MEMBER must be at least twenty-five years of age, and must have been engaged in some branch of engineering for at least six years, which period may include apprenticeship or pupilage in a qualified engineers' office, or a term of instruction in some school of engineering recognized by the Council. In every case the candidate must have held a position of professional responsibility, in charge of work as principal or assistant, for at least two years.

Every candidate who is not a graduate of some school of engineering recognized by the Council, shall be required to pass an examination before a Board of Examiners appointed by the Council, on the theory and practice of engineering, and especially in one of the following branches at his option Railway, Municipal, Hydraulic, Mechanical, Mining, or Electrical Engineering.

This examination may be waived at the discretion of the Council if the candidate has held a position of professional responsibility for five years or more years.

Every candidate for election as JUNIOR shall be at least twenty-one years of age, and must have been engaged in some branch of engineering for at least four years.

This period may be reduced to one year, at the discretion of the Council, if the candidate is a graduate of some school of engineering recognized by the Council. He shall not remain in the class of Junior after he has attained the age of thirty-five years.

Every candidate who is not a graduate of some school of engineering recognized by the Council, or has not passed the examinations of the first year in such a course, shall be required to pass an examination in the following subjects Geography, History (that of Canada in particular), Arithmetic, Geometry Euclid (Books I.-IV. and VI.), Trigonometry, Algebra up to and including quadratic equations.

## Notes on "Civil Aviation"

Every candidate for election as ASSOCIATE shall be one who by his pursuits, scientific acquirements, or practical experience is qualified to co-operate with engineers in the advancement of professional knowledge.

The fact that candidates give the names of certain members as references does not necessarily mean that their applications are endorsed by such members.

1919 : Aircraft in peace and the law - James Molony Spaight : Regulations framed to secure safety of international circulation, whether by land, by sea, or by air, might have in view the safety of two or, with a subdivision of one of these classes, three classes of persons, and they might aim at securing it in two distinct ways. In other words, they might pursue either or both of two ends :

A—the end of the safety of those carried in the vehicle, who might again be distinguished according as they were (i) the crew or persons working the vehicle, and (2) the passengers or those carried in it but not working it ; and

B—the end of the safety of third parties, whether the general public or that portion of it which travels in other similar vehicles.

They might pursue these ends by either or both of two means : X— by ensuring that the vehicle was sound ; and Y— by ensuring that the person or persons in charge of it were competent.

The question before us is whether an international Convention should pursue the ends A and B by the means X and Y, or whether either, and if so which, of the ends, or again of the means, should be neglected.

### Safety Provisions for Air Locomotion

How, then, should one legislate internationally for safety in the air ? Should ends A (both subdivisions) and B both be sought, and should means X and Y both be employed ? One can be guided to an answer by the automobile and maritime precedents ; but it is necessary to remember, in regard to the latter, that an aerial vehicle circulates in areas entirely different from those in which ocean-going steamships ply. A steamship cannot come down in a city street or in a citizen's back garden.

### The Purpose of Safety Certification in the Case of Aerial Locomotion unprecedentedly wide

For the moment we may neglect collision rules for the air (which are dealt with in Chapter VII, *infra*) and consider only the question of certification of vehicle and personnel as a means of ensuring safety. From the nature of aviation the safety of third parties—end B— must necessarily be secured, not primarily, as at sea, by collision regulations, but, as in the case of motor vehicles, by certification of machine and driver or pilot. Certification has consequently a wider purpose in the case of aircraft than in the case of seacraft.

It has to be relied upon to secure the safety of all the three classes, A (i), A (2), and B ; and of these the greatest numerically and the most worthy of consideration in virtue of their passivity are the people in class B. Indeed, given that class B must be protected, the safety of classes /i (i) and A (2) would almost automatically

follow from the certification (and only certification is here in question) which would be necessary to secure the safety of that one class. To secure it, one would expect both means X and means Y to be employed. Yet one finds a tendency in recent projects of legislation to ignore class 5, so far as their protection by means of the certification of aircraft and pilots is concerned, and to think only of class A, and, of class ^, principally of subdivision (2). Again one finds means Y placed in a position of greater prominence than means X. The former tendency will probably be rectified before long by some serious catastrophe which will draw public attention to the importance of ensuring that flying machines are safe not only for the public carried in them as passengers, but for the much greater public over whose heads they fly as well. The need for the protection of aviators themselves, so far as certification of aircraft is a protection, will also force itself to the front. As to the preference shown for means Y over means X, this is the inevitable result of the comparative nature and conditions of the two kinds of certification. The certification of personnel is a simple matter and is administratively effective and worth while ; that of the material is so troublesome, recurrent, and unsatisfactory in results that doubt has been expressed whether it pays.

As long ago as 1910 M. Ernest Archdeacon stated in *La Revue Aérienne* that certificates of navigability were a " gross error " ; his view being that flying machines were in the stage of rapid and constant development and that the standard of safety and the origin of flying accidents were equally unknown factors. He held strongly that to require certification as to airworthiness would hamper seriously the progress of aviation. ^  
• R.J.L.A., 1910, p. 326.

M. Archdeacon's views are still echoed by many authorities to-day. Whether a certificate of navigability is necessary or desirable is a question that is much debated. M. Fauchille's draft project of a Convention, originally published in 1902 and revised in 1910, makes the *permis de circulation* dependent on proof of navigability.^ The French Presidential Decret of 17 December, 1913, ^ required every aircraft to obtain a certificate of navigability by actual examination conducted either by the *Service des Mines* or by an association recognised by that department ; but an exception was allowed in the case of French machines constructed according to a type approved already and accompanied by the constructor's certificate that they conformed to that type. Machines used for flying at aerodromes, unless they took pupil-pilots into the air, were excepted from the regulation which required a certificate of navigability. The International Convention drafted at the Paris Conference in 1910

## Notes on "Civil Aviation"

provided for a certificate of navigability issued or authenticated by the State whose nationality the aircraft possessed. So, too, the rules proposed by the Syndicat General de l'Aviation in April, 1910, made a permis de navigation ^ as well as a permis de conduire (pilot's certificate or licence), necessary for flights over " agglomerations " (towns, villages, etc.). ^ The Law of 15 May, 1913, of the State of Massachusetts required all aircraft except those used for experiments in aerodromes to be examined by an official of the Highway Commission, registered, and assigned a number : the pilot had also to be licensed."

Serbian official Regulations of 21 February- 16

March, 1913, required both the aircraft and the pilot to be certificated ;  
" such machines," says Article 2 of the Regulations, " must be absolutely safe and cannot be used without a permit from the Minister of the Interior," and Article 4 adds that " The pilot must possess a certificate of capability delivered by the Minister of War.

Certification of Passenger-carrying Aircraft :

Apart from flights over " agglomerations," the rules of the Syndicat General drafted in 1910 made a pilot's licence necessary where a machine carried passengers, and there *has lately been a tendency to limit the requirement of a certificate of navigability to passenger-carrying aircraft.*

In the debate in the House of Commons in February, 1919, Sir Fortescue Flannery urges that that "*as the Board of Trade protects the public by inspecting ships and railways, so it should intervene in the public interest to inspect aircraft, test materials, and examine designs*". This view was opposed by Colonel Moore-Brabazon, who held that "commercial aviation" would of itself insist on security, and that the proper body to regulate and inspect the machines was not any Government organisation, but such a society as " Lloyd's."

A Lloyd's Register for Aircraft

The difficulty is that *the public require protection from flying-machines not only in the capacity of passengers but in the capacity of normal, earth-hugging citizens as well* ; and that the establishment of a Lloyd's Register for the air will require a considerable time to materialise.

The idea of such a Register is not new.

In 1910 Zaharoff, that benefactor of aviation, gave 50,000 francs *for the study of the prevention of flying accidents* and, incidentally, *of the best means of establishing a " Bureau Veritas " for the air*, the Bureau Veritas being *the French equivalent of the British Lloyd's*, i.e., an organisation *which secures the sound construction and continued sea-worthiness of ships.*

M. Locket's conclusion was that "the best guarantee of airworthiness was the pilot's own interest in preserving his life"  
*Perhaps in this he went too far.*

*To rely upon the caution and judgment of a young airman, perhaps of an abnormally optimistic temperament, in such a matter could not be justified where passenger carrying aircraft are in question.*

At the Paris Conference of 1910 the Italian Minister of War proposed that *aircraft should be inspected annually* by a special technical commission. An annual inspection for aircraft would be almost useless. *The Safety Certificate which is required for ships under Article 57 of the Convention on Safety of Life at Sea is valid only for twelve months* (paragraph 59), but *the conditions are entirely different where aircraft are in question. If there is not a practically daily inspection, an inspection after so many " flight hours " should be the rule.*

The British "Aerial Navigation Regulations, 1919" require the pilots, navigators, and engineers of passenger or goods aircraft to pass a medical examination under the direction of the Air Ministry and to obtain a certificate of competency (which, in the

## Notes on “Civil Aviation”

case of pilots and navigators, is issued by the Air Ministry itself, as a preliminary to the licence), as well as, in the case of pilots, to produce proof of recent flying experience on the class of machine for which the licence is required.

*Licences* for pilots of other than passenger or goods aircraft *are given* without medical examination, but *competency has to be established*.

### INTERNATIONAL CONVENTION - 1919

a special Aeronautical Commission of the Peace Conference, which had its origin in the Inter-Allied Aviation Committee created in 1917, was formed on 6 March 1919 under the auspices of the Peace Conference. The countries represented at the Commission were: Belgium, Brazil, the British Empire, Cuba, France, Greece, Italy, Japan, Portugal, Romania, the Kingdom of the Serbs, Croats and Slovenes, and the United States <sup>141</sup>. At the first meeting, the Commission agreed to produce a set of basic principles in preparing the Convention and its Annexes; it established three Sub-Commissions which were legal, technical, and military. These three were aided by draft conventions submitted by France, Great Britain, and the United States; Italy submitted a draft proposal for aerial navigation laws. The Convention Relating to the Regulation of Aerial Navigation, was initially signed by 27 States on 13 October 1919. 1 June 1922, fourteen instruments of ratification (the British Empire with its Dominions counted for 7 States: Great Britain, Australia, Canada, India, Ireland, New Zealand, and Union of South-Africa) were deposited with the French Ministry of the Foreign Affairs; hence, the Convention and ICAN could enter into force forty days later, that is to say on 11 July 1922. ICAN possessed administrative, legislative, executive and judicial powers, as well as being an advisory body and a center of documentation. The provisions of the Convention became part of the national legislation of the Contracting States and proved to be an inspiration to the development of national law in Europe. The work of the ICAN and its sub-commissions proved to be very helpful in the drafting of the technical annexes to the Chicago Convention of 1944.

### CONVENTION RELATING TO INTERNATIONAL AIR NAVIGATION, 1919.

Annexes.

Annex A.—The Marking of Aircraft.

Annex B.—Certificates of Airworthiness.

Annex C.—Log Books.

Annex D.—Rules as to Lights and Signals.—Rules of the Air.

Annex E.— Minimum Qualifications necessary for obtaining Certificates as Pilots and Navigators.

Annex F.—International Aeronautical Maps and Ground Markings. {Not given here.}

Annex G.—Collection and Dissemination of Meteorological Information. {Not given here.}

Annex H.—Customs

### GENERAL PRINCIPLES.

#### Article 1

The contracting States recognise that every State has complete and exclusive sovereignty in the air space above its territory and territorial waters.

#### Article 2.

Each contracting State undertakes in time of peace to:

A. accord freedom of innocent passage above its territory and territorial waters, as well as

B. accord freedom of innocent passage above the territories and territorial waters of its Colonies

to the aircraft of the other contracting States, provided that the conditions established in this Convention are observed.

All regulations made by a contracting State as to the admission over its territory of the aircraft of the other contracting States shall be applied without distinction of nationality.

### ANNEX B : CERTIFICATES OF AIRWORTHINESS

The following main conditions govern the issue of certificates of airworthiness :-

1. The design of the aircraft in regard to safety shall conform to certain standard minimum requirements.

2. A satisfactory demonstration must be made in flying trials of the actual flying qualities of the type of aircraft examined, provided that machines subsequently manufactured which conform to the approved type need not be subject to such trials. The trials shall conform to certain standard minimum requirements.

3. The construction of every aircraft with regard to workmanship and materials must be approved. The control of the construction and of the tests shall be in accordance with certain standard minimum requirements.

---

<sup>141</sup> [https://www.icao.int/secretariat/PostalHistory/1919\\_the\\_paris\\_convention.htm](https://www.icao.int/secretariat/PostalHistory/1919_the_paris_convention.htm)

## Notes on "Civil Aviation"

4. The aircraft must be equipped with suitable instruments for safe navigation.

5. The standard minimum requirements (of AIRWORTHINESS) of paragraphs I to 3 inclusive shall be fixed by the International Commission for Air Navigation. Until they have been so fixed each contracting State shall determine the regulations under which certificates of airworthiness shall be granted or remain valid.

### ANNEX C : Log Books

#### II : AIRCRAFT LOG.

This is obligatory only in the case of aircraft carrying passengers or goods for hire, and shall contain the following particulars :-

- (a) Category to which the aircraft belongs ; its nationality and registration marks ; the full name, nationality and residence of the owner ; name of maker and the carrying capacity of the aircraft.
- (b) Type and series number of engine ; type of propeller showing number, pitch, diameter and maker's name.
- (c) Type of wireless apparatus fitted.
- (d) Table showing the necessary rigging data for the information of persons in charge of the aircraft and of its maintenance.
- (e) A fully detailed engineering record of the life of the aircraft, including all acceptance tests, overhauls, replacements, repairs and all works of a like nature.

#### III : ENGINE LOG.

This is obligatory only in the case of engines installed in aircraft carrying passengers or goods for hire, and in such cases a separate log book shall be kept for each engine and shall always accompany the engine. It shall contain the following particulars :

- (a) Type of engine, series number, maker's name, power, normal maximum revolutions of engine, date of production and first date put into service.
- (b) Registration mark and type of aircraft in which the engine has been installed.
- (c) A fully detailed engineering record of the life of the engine, including all acceptance tests, hours run, overhauls, replacements, repairs, and all work of a like nature.

ch 3 : certificates of airworthiness and competency.

### Article 11 : Certificates of airworthiness for Air-Craft

Every aircraft engaged in international navigation shall, in accordance with Annex B, be provided with a certificate of airworthiness issued or rendered valid by the State whose nationality it possesses.

### Article 12 : Certificates for commanding officer, pilots, engineers and other members of the operating crew

The:-

- 1. commanding officer,
- 2. pilots,
- 3. engineers; and
- 4. other members of the operating crew

of every aircraft shall, in accordance with Annex E, be provided with :-

- A. certificates of competency and
- B. licences

issued or rendered valid by the State whose nationality the aircraft possesses.

### Article 13 : Certificates of airworthiness and of competency and licences issued or rendered valid by the State whose nationality the aircraft possesses

In accordance with the regulations established by Annex B and Annex E and hereafter by the International Commission for Air Navigation :

- 1. Certificates of airworthiness
- 2. Certificates of competency and
- 3. licences

issued or rendered valid by the State whose nationality the aircraft possesses shall be recognised as valid by the other States.

Each State has the right to refuse to recognise for the purpose of flights within the limits of and above its own territory certificates of competency and licences granted to one of its nationals by another contracting State.

ORDER OF THE SECRETARY OF STATE UNDER  
THE AIR NAVIGATION ACTS, 1911 TO 1919.

In pursuance of the powers conferred upon me by the Air Navigation Acts, 1911 to 1919, and all other powers enabling me in that behalf, I, the Right Honourable Winston Spencer Churchill, one of His Majesty's Principal Secretaries of State, by order make the following regulations :

—  
I. General Conditions of Flying.—No aircraft shall fly within the limits of the British Islands and the territorial waters adjacent thereto unless the following conditions are complied with :

- 
- (1) The aircraft shall be registered in the prescribed manner :
  - (2) The aircraft shall bear the prescribed registration and nationality marks, affixed or painted on the aircraft in the prescribed manner :
  - (3) The personnel of the aircraft shall be licensed in the prescribed manner :
  - (4) There shall be carried in the aircraft

- 
- (a) the certificate of registration ; and
  - (b) the licence of any member of the personnel who is required to be licensed :
  - (5) The provisions of these regulations as to general safety, and the rules as to lights and signals and rules of the air, as set out in these regulations, shall

be duly complied with :

(6) No mails shall be carried without the consent in writing of the Postmaster-General, and no wireless apparatus shall be installed or worked except under and in accordance with a licence granted by the Postmaster-General, containing such conditions as may be approved by the Secretary of State :

(7) The aircraft shall not fly over any prohibited area as defined by these regulations :

Provided that

—  
(a) the requirements of this regulation as to registration and as to the bearing of registration and nationality marks shall not apply to aircraft built for the purpose of experiment, and flown for the purpose of experiment or test only within three miles of an aerodrome or aircraft factory or in accordance with such directions (if any) as may be given by the Secretary of State ; and (6) the requirements of this regulation as to licensing of personnel shall not apply within the precincts of an aerodrome in the case of personnel under instruction or of aircraft flying for experimental purposes.

2. Additional Conditions in Certain Cases.—Without prejudice to the last foregoing regulation

—  
(i) A passenger aircraft carrying passengers shall not

—  
(a) fly within the limits aforesaid unless it has been certified in the prescribed manner as airworthy, and the prescribed conditions as to airworthiness, periodical overhaul, and examination before each flight are complied with, and also the prescribed certificates in relation to airworthiness are carried in the aircraft ; or

(b) use as a regular place of departure or place of landing any place other than a licensed aerodrome, or a Royal Air Force aerodrome or aerodrome under the control of the Secretary of State approved for the purpose by the Secretary of State :

(2) A passenger or goods aircraft shall not fly within the limits aforesaid unless there are carried in the aircraft the prescribed log-books, accurately kept up to date in the prescribed form and manner :

(3) An aircraft arriving in or departing from the United Kingdom shall comply with the provisions of these regulations applicable to such a case.

3. Reference to Schedules.—(i) The provisions in the schedules to these regulations shall have effect as part of these regulations, and shall be duly observed by all persons concerned in the cases to which they relate, that is to say :-

Schedule. Subject matter.

I. Registration of aircraft.

II. Licensing of personnel.

III. Certificates of airworthiness for passenger aircraft, and periodical overhaul and examination of such aircraft.

IV. Registration and nationality marks.

V. Log-books.

VI. Prohibited areas.

VII. Rules as to lights and signals and rules of the air.

VIII. Rules as to aircraft arriving in or departing from the United Kingdom.

(2) The Secretary of State may, if he thinks fit, issue directions for the purpose of supplementing or giving full effect to the provisions of the above schedules, or for any purpose for which provision is under these regulations to be made by direction of the Secretary of State.

4. Aerodromes.—(i) No place in the British Islands shall be used as an aerodrome or as a regular place of landing or departure by passenger aircraft carrying passengers, unless it has been licensed for the purpose by the Secretary of State, and any conditions of the licence are complied with.

(2) There shall be kept exhibited in a conspicuous place at all aerodromes used for the landing or departure of passenger or goods aircraft, a tariff of charges in such form and on such scale as may be directed or approved by the Secretary of State.

(3) In the case of any contravention of or failure to comply with this regulation, the proprietor of the aerodrome shall be deemed to have acted in contravention of or, as the case may be, failed to comply with these regulations.

(4) This regulation shall not apply to Royal Air Force aerodromes or aerodromes under the control of the Secretary of State, the use of which has been sanctioned by the Secretary of State; provided that any directions of the Secretary of State as to the use of such aerodromes are complied with.

5. General Safety Provisions.—(i) An aircraft shall not fly over any city or town except at such altitude as will enable the aircraft to land outside the city or town should the means of propulsion fail through mechanical breakdown or other cause:

Provided that this prohibition shall not apply to any area comprised within a circle with a radius of one mile from the centre of a licensed aerodrome or of a Royal Air Force aerodrome, or of an aerodrome under the control of the Secretary of State.

(2) No person in any aircraft shall

- 
- (a) carry out any trick flying or exhibition flying over any city or town area or populous district; or
- (b) carry out any trick flying or exhibition flying over any regatta, race meeting, or meeting for public games or sports, except where specially arranged for in writing by the promoters of such regatta or meeting; or
- (c) carry out any flying which by reason of low altitude or proximity to persons or dwellings is dangerous to public safety; or
- (d) drop, or cause or permit to be dropped, from the aircraft any article except ballast as authorised by the rules of the air as set out in these regulations.

6. Production of Licences, Certificates and Log-books for Inspection.—(i) Any member of the personnel of an aircraft

shall on demand produce his Licence for the inspection of any person authorised for the purpose by the Secretary of State.

(2) The owner and person in charge of any aircraft shall, on demand, produce for the inspection of any person authorised for the purpose by the Secretary of State, any certificates or licences relating to the aircraft, and also, in the case of passenger or goods aircraft, any of the prescribed logbooks.

7. Right of Inspection of and Access to Aerodromes and Factories.—(i) Any person authorised by the Secretary of State for the purpose shall have the right of access at all reasonable times to any aerodrome for the purpose of inspecting the same, or to any place to which access is necessary for the purpose of carrying out his powers and duties under these regulations.

(2) All aircraft belonging to or employed in the service of His Majesty? shall have at all reasonable times the right of access to any licensed aerodrome.

(3) During the construction of a passenger aircraft any person authorised by the Secretary of State shall at all times during working hours have the right of access, for purposes of inspection, to that portion of the shops in which parts are being manufactured or assembled, and to drawings of the parts under inspection, whether at the works of the main contractor or of sub-contractors.

8. Exceptions.—These regulations do not (except where otherwise expressly stated) apply

—  
[a] to military aircraft belonging to or employed in the service of His Majesty ; or

(6) to any aircraft or to any persons if and to such extent as such aircraft or persons may be excepted from these regulations, or any of them, by direction of the Secretary of State on the recommendation of a Government Department.

9. Foreign Aircraft.—The provisions of these regulations as to

—  
(a) registration of aircraft ;  
(b) licensing of personnel ;  
(c) airworthiness ;  
(d) log-books ; and  
(e) wireless apparatus ;  
shall not apply to foreign aircraft :  
Provided that

—  
(i) no foreign military aircraft shall fly over or land in the British Islands or the territorial waters adjacent thereto except on the express invitation or with the express permission of His Majesty or of a Government Department, but any such aircraft landing on such invitation or with such permission shall be exempt from these regulations to such extent and on such conditions as may be specified in the invitation or permission ; and  
(ii) where any foreign aircraft, after first landing in the British Islands, flies over any part thereof except

in such manner as may be necessary in order to proceed to a foreign destination, and the provisions of these regulations shall apply to that aircraft unless there are carried in the aircraft, and produced for inspection as and when required by the Secretary of State, certificates, licences, and logbooks issued by the responsible authority in the country to which the aircraft belongs, complying substantially with the provisions of these regulations, and unless (in the case of a passenger aircraft) the conditions of the aircraft from the point of view of the safety of the passengers and personnel correspond substantially with the particulars contained in the certificates produced.

10. Penalties.—(i) Where any aircraft flies in contravention of, or fails to comply with, these regulations or any provision thereof, the owner of the aircraft, and also the pilot or commander, shall be deemed to have contravened or, as the case may be, failed to comply with these regulations : Provided that it shall be a good defence to any proceedings for contravention or failure to comply with these regulations if the contravention or failure is proved to have been due to stress of weather or other unavoidable cause.

(2) If any person obstructs or impedes any person acting under the authority of the Secretary of State in the exercise of his powers and duties under these regulations, such firstmentioned person shall be deemed to have acted in contravention of these regulations.

(3) Any person contravening or failing to comply with these regulations or any provision thereof is liable to imprisonment for a term not exceeding six months or to a fine not exceeding two hundred pounds, or to both such imprisonment and fine.

(4) Any aircraft which flies or attempts to fly over a prohibited area is liable to be fired on in accordance with section two of the Aerial Navigation Act, 1913, and the provisions of these regulations relating thereto.

(5) If any person in any aircraft is guilty of any act of espionage to which the provisions of section one of the Official Secrets Act, 1911, apply, he is liable to penal servitude for a term not exceeding seven years.

11. Power to Cancel or Suspend Licences and Certificates.—(

i) The licence of any member of the personnel of an aircraft, or the licence of any aerodrome, may be cancelled or suspended by the Secretary of State on sufficient ground being shown to his satisfaction, after due inquiry and his decision shall be final

:

Provided that in special cases the Secretary of State may suspend any such licence temporarily and provisionally pending the holding of an inquiry.

(2) Any certificate relating to the airworthiness of an aircraft may be cancelled or suspended by the Secretary of State if he is satisfied that reasonable doubt exists as to the safety of the aircraft in question, or of the type to which the aircraft in question belongs.

(3) Where any person is convicted of any contravention

## Notes on "Civil Aviation"

or failure to comply with these regulations in respect of any aircraft, the Secretary of State may cancel or suspend the certificate of registration of that aircraft.

12. Interpretation.—In these regulations, unless the context otherwise requires,

—

" Aircraft " includes airships and flying machines, all balloons, whether fixed or free, and kites ;

" Airship " means an aircraft lighter than air and having means of propulsion ;

" Balloon " means an aircraft lighter than air and having no means of propulsion ;

" Flying machine " includes aeroplanes, seaplanes, flying boats, and other flying machines heavier than air and having means of propulsion ;

" ^ Military aircraft " includes naval, military, and airforce aircraft ;

" Passenger aircraft " and " goods aircraft " mean respectively aircraft intended for carrying passengers, or goods (including mails), for hire or reward, and include respectively aircraft on which passengers or goods are actually so carried ;

" Personnel " (in relation to any aircraft) includes any pilot, commander, navigator, and engineer, and any operative member of the crew ;

" Aerodrome " means any definite and limited ground or water area intended to be used and capable of being used, either wholly or in part, for the landing or departure of aircraft ;

" Proprietor of an aerodrome " includes any person responsible for the management thereof ;

" Licensed aerodrome " means an aerodrome licensed under these regulations ;

" Prescribed " means prescribed by these regulations or by directions of the Secretary of State thereunder ;

" Prohibited area " means any of the areas referred to in Schedule VI. of these regulations ;

" Secretary of State " includes, in relation to any purpose of these regulations, any person authorised by the Secretary of State for that purpose.

The Interpretation Act, 1889, applies for the purpose of the interpretation of these regulations as it applies for the purpose of the interpretation of an Act of Parliament, and as if these regulations were an Act of Parliament.

13. Saving.—Nothing in these regulations shall be construed as conferring any right to land in any place as against the owner of the land or other persons interested therein, or as prejudicing the rights or remedies of any person in respect of any injury to persons or property caused by any aircraft.

14. Short Title.—These regulations may be cited as the Air Navigation Regulations, 1919.

Winston S. Churchill,  
Air Ministry, London, {one of His Majesty's principal Secretaries of State}.  
30 th April, 1919.

SCHEDULES (Rules) to the United Kingdom Air Navigation Regulations, 1919

## Notes on "Civil Aviation"

### SCHEDULE I : Registration of Aircraft.

1. Certificates of registration shall be granted by the Secretary of State, and upon registration there shall be assigned to the registered aircraft a registration mark.
2. The applicant, unless the Secretary of State in special cases otherwise allows, must be a British subject, or in the case of a body corporate must be registered and have its principal place of business in the United Kingdom.
3. Application for registration shall be made to the Secretary, Air Ministry.
4. The fee to be charged for registration will be one guinea.
5. Upon any change of ownership of registered aircraft, the certificate of registration shall lapse, but a fresh certificate may be applied for by the new owner.

### SCHEDULE II : Licensing of Personnel.

#### Licensing Authority.

1. Licences shall be granted by the Secretary of State. Applications therefor shall be made to the Secretary, Air Ministry.

#### Pilots.

2. A person applying for a pilot's licence to fly passenger or goods aircraft will be required to:-
  - (a) pass a medical examination carried out under the control of the Secretary of State ;
  - (b) produce a certificate of competency issued by the Secretary of State, or be qualified as a Royal Air Force pilot ;
  - (c) submit proof of recent reasonable flying experience on the class of machine for which the licence is required, or failing such proof undergo practical tests.
3. A person applying for a pilot's licence to fly machines other than passenger or goods aircraft must either be qualified as a Royal Air Force pilot, or produce a certificate of competency issued by the Secretary of State. Navigators.
4. A person applying for a licence to navigate passenger or goods aircraft will be required to :-
  - (a) pass a medical examination carried out under the control of the Secretary of State ;
  - (h) produce a certificate of competency issued by the Secretary of State.

#### Engineers.

5. A person applying for a licence to be engaged as engineer on passenger or goods aircraft will be required to :-
  - (a) pass a medical examination carried out under the control of the Secretary of State ;
  - (b) submit proof of sufficient knowledge and experience in the management of aircraft engines ;
  - (c) undergo, if necessary, practical and theoretical tests.

#### Other Persons.

6. Persons applying for a licence in any other capacity than those above specified must comply with such conditions as may be directed by the Secretary of State. General.
7. Holders of licences may be required from time to time to undergo further medical examinations carried out under the control of the Secretary of State.
8. Licences shall remain valid for the following periods :-  
Pilots' licences - - - 6 months,  
Other licences - - - 12 months,  
and shall not be valid unless endorsed by the Secretary of State at those intervals.
9. The fee to be charged in respect of each licence issued and in respect of each such endorsement as aforesaid shall be five shillings.

In the event of any applicant being required to undergo such practical tests as are specified in paragraphs 2 (c) and 5 (c) above, a further fee of one guinea will be charged.

### SCHEDULE III.

#### Certificates of Airworthiness for Passenger Aircraft AND Periodical Overhaul and Examination of SUCH Aircraft.

#### General.

1. A certificate of airworthiness in respect of one aircraft of any type (hereinafter referred to as "a type aircraft " will be issued by the Secretary of State in accordance with the conditions set out in this schedule at a charge of five guineas,
2. After the issue of a certificate of airworthiness to a type aircraft, any further aircraft of that "Type" will be inspected for airworthiness by employees of the constructor, under arrangements approved by the Secretary of State, and if the aircraft in respect of which a certificate of airworthiness is desired conforms in all essential respects with the type aircraft, and is of

## Notes on "Civil Aviation"

satisfactory workmanship and materials, a certificate of airworthiness will be issued in respect of such aircraft by the Secretary of State at a charge of one guinea :

Provided that the Secretary of State may take steps to test the inspection made by the employees of a constructor, and if such test inspection, in his opinion, warrants such a course, may order a further inspection to be carried out by any person or persons duly authorised by him, and to issue or refuse a certificate, as he may decide, after such inspection, or to refuse to issue certificates of airworthiness in respect of further aircraft of the same type as that subjected to such test inspection that have been or may be constructed by the particular constructor.

3. Licences to competent persons for the purposes of this schedule shall be granted by the Secretary of State on compliance with such conditions as he may direct.

### Type Aircraft.

4. A certificate of airworthiness will not be granted for any type of passenger aircraft until the following conditions stipulated below have been fulfilled :

- (a) The design has been approved by the Secretary of State in regard to safety ;
- [b] The construction has been so approved in regard to workmanship and material used ; and
- (c) A satisfactory demonstration in accordance with the directions of the Secretary of State has been made in flying trials that the aircraft is safe for the purpose for which it is intended.

### Periodical Overhaul.

5. All passenger aircraft must be inspected, overhauled and certified as airworthy by competent persons appointed by the owners or users of them, and licensed for the purpose under this schedule, at such times as the Secretary of State may direct, and such certificate or certificates must be produced to the Secretary of State on demand.

6. Aircraft inspected, overhauled, or certified as provided in the foregoing paragraph may be inspected by authorised representatives of the Secretary of State, and the Secretary of State is entitled under these regulations to cancel or suspend the certificate of airworthiness of any aircraft deemed to be unsafe as a result of such inspection.

### Examination before each Flight.

7. No passenger aircraft carrying passengers shall on any day proceed on any journey unless it has previously been inspected at least once on that day by a competent person licensed for the purpose under this schedule, who shall not be the pilot of the particular machine.

8. If such competent person is satisfied that the aircraft is fit in every way for the flight or flights proposed, he shall sign in duplicate a certificate to that effect, which certificate shall be countersigned by another person in the employment of the owner, giving the time and date of such certification. For this purpose the counter-signature of the pilot may be accepted.

9. One copy of each certificate will be retained by the owner of the aircraft, and the duplicate copy must be carried in the aircraft.

10. *The pilot will be responsible for seeing that the aircraft, before commencing any flight*, is, in his opinion, in a satisfactory condition and does not carry more than the load specified in the certificate of airworthiness, and must sign a certificate to that effect.

## SCHEDULE IV.

### Registration and Nationality Marks.

[The British regulations on this subject are identical in substance with those contained in paragraphs II to VII, inclusive, of Annex A, " The Marking of Aircraft," of the International Convention—see Appendix I—and are therefore omitted here.]

## SCHEDULE V.

### Log-books.

1. Log-books shall take the form of an aircraft log-book, an engine log-book, a journey log-book, and a signal logbook.

If more than one engine is fitted a separate log-book shall be provided for each engine.

2. Each log-book shall be self-contained, but aU log-books shall be kept together in the aircraft in a waterproof bag of a pattern authorised by the Secretary of State.

3. The log-books shall conform in all essentials to the patterns authorised by the Secretary of State, and shall contain such information and particulars as the Secretary of State may direct.

## SCHEDULE VI.

### Prohibited Areas.

I. Each of the places named or described in the following Ust, with the land and territorial waters surrounding such

## Notes on "Civil Aviation"

place to a distance of three statute miles in all directions from its boundary, shall be a prohibited area :-

2. The prohibited areas are more particularly shown in a map issued for the purpose by the Secretary of State.
3. The officer to give the signals and take the action mentioned in section 2 of the Aerial Navigation Act, 1913, shall be a commissioned officer in His Majesty's Naval, Military, or Air Forces.
4. The signals which may be given when an aircraft flies or attempts to fly over any of the prohibited areas shall be as follows :

By day : three discharges, at intervals of not less than ten seconds, of a projectile showing smoke on bursting.

By night : three discharges, at intervals of not less than ten seconds, of a projectile showing red stars or red lights.

5. On such a signal being given, the aircraft shall immediately land at the nearest practicable spot ; provided that, if it be approaching or flying over any prohibited area, it shall not, in descending, advance further towards or into the area.

6. If an aircraft is unable to land immediately in response to the signal, owing to stress of weather or other unavoidable cause, it shall make the following signal :

By day : show, from the place where they can be most clearly seen from below, a red triangular flag, together with two black balls superimposed vertically one above the other ;

By night : wave a white light, at the same time extinguishing the side lights ;

and shall, as soon as possible, land at the nearest practicable spot in the United Kingdom.

SCHEDULE VII : Rules as to Lights and Signals and Rules of the Air.

[The British rules are identical in substance with those contained in Annex D of the International Convention Appendix I]

SCHEDULE VIII : Rules as to Aircraft arriving in or departing from  
THE United Kingdom.

Preliminary.

I.—(i) For the purposes of the rules in this schedule the following aerodromes are appointed aerodromes, that is to say :

New Holland, Lincolnshire ;

Hadleigh, Suffolk ;

Lymington, Kent ;

Hounslow, Middlesex.

Provided that the Secretary of State may by directions add any aerodrome to the list of appointed aerodromes or remove any aerodrome from that list.

(2) For the purposes of the rules in this schedule:-

" Importer " has the same meaning as in the Customs Consolidation Act, 1876 ;

" Commissioners " means Commissioners of Customs and Excise ;

" Examination station " means a place at an appointed aerodrome approved by the Commissioners as an examination station ;

" Pilot " includes person in charge.

Other expressions have the same meaning as in the general provisions of these regulations.

Arrival at and departure from Appointed Aerodromes.

2. No aircraft entering the United Kingdom from abroad shall land for the first time in the United Kingdom except at an appointed aerodrome : Provided that this rule shall not apply where an aircraft is compelled to land before arriving at an appointed aerodrome, owing to accident, stress of weather, or unavoidable cause, in which event the procedure laid down in rule 21 (hereafter) will be followed.

3. No aircraft shall fly to a place outside the United Kingdom unless it has departed from an appointed aerodrome.

4.—(i) No person in any aircraft entering the United Kingdom shall carry or allow to be carried in the aircraft:-

(a) any goods the importation of which is prohibited by the laws relating to Customs ;

(b) any mails, except with the permission in writing of the Postmaster-General.

(2) No person in any aircraft entering the United Kingdom shall break or alter any seal placed upon any part of the aircraft or upon any goods therein by a Customs officer at the aerodrome from which he departed for the United Kingdom.

5. No aircraft shall enter or leave the United Kingdom, having any secret or disguised place adapted for concealing goods.

6. The pilot of any aircraft arriving at an appointed aerodrome from a place outside the United Kingdom shall, on landing, forthwith take his aircraft to the examination station at that aerodrome ; provided that a pilot shall not be deemed to have contravened or failed to comply with this rule if he proves that circumstances over which he had no control prevented him from taking his aircraft to the examination station, and that, after the report required by rule 7

## Notes on "Civil Aviation"

(hereunder) had been duly made by him, all goods carried in the said aircraft were removed to the examination station in the presence of an officer of Customs and Excise or some person duly authorised by the Secretary of State.

7. Within twenty-four hours after the landing at any appointed aerodrome of an aircraft from a place outside the United Kingdom the pilot shall:-

(a) make a report to the proper officer of Customs and Excise in the form prescribed by the Commissioners ; and

(b) truly furnish the several particulars required by such form ; and

(c) deliver to such officer with such report his log-book, manifest, and declaration of the goods on board his aircraft signed by the proper Customs officer at the aerodrome from which he departed for the United Kingdom ; and

(d) land at such aerodrome for examination of baggage all passengers carried in such aircraft, and, after making such report, shall produce, and, if required to do so, shall land, all goods in such aircraft for examination.

8. If at any aerodrome or other place within the United Kingdom goods or passengers are loaded for conveyance by air to an appointed aerodrome, the pilot shall obtain from the proprietor of the aerodrome of departure a certificate of departure in the form prescribed by the Secretary of State and the Commissioners, and on arriving at the appointed aerodrome the aircraft, and all goods and passengers carried therein, shall, on production of such certificate, be exempt from inspection by an officer of Customs and Excise, unless such officer has reason to suspect that the aircraft has, since the issue of such certificate, called at a place outside the United Kingdom.

9. The pilot of every aircraft in which goods are to be exported shall, before any goods be taken on board, deliver to the proper officer of Customs and Excise a notice of departure for a foreign destination in the form prescribed by the Commissioners, in which shall be truly stated the particulars required by such form,

10.—(i) Every pilot of an aircraft carrying goods to any place outside the United Kingdom shall deliver to the proper officer of Customs and Excise at an appointed aerodrome, together with any log-books belonging to the aircraft, an application for clearance from that aerodrome in the form prescribed by the Commissioners, in duplicate, and also if the aircraft carries any goods a manifest and declaration in the form prescribed by the Commissioners declaring the goods and stores on such aircraft, and shall truly state therein the particulars required by such forms respectively ; and such forms, when signed by such officer, shall be the

clearance and authority for the aircraft to proceed to its foreign destination.

(2) No pilot shall depart in any such aircraft from the United Kingdom until he has obtained such authority, or shall, after obtaining such authority, call at any other place in the United Kingdom before proceeding to his foreign destination. Any pilot intending to land at one or more appointed aerodromes before proceeding to his foreign destination shall apply for the said clearance and authority at the last appointed aerodrome at which he lands.

### Importation, Entry, and Unloading of Goods.

11. No person importing goods in an aircraft shall bring the goods into any place in the United Kingdom other than an appointed aerodrome, or shall unload the goods from any aircraft except at an examination station (unless such goods are unloaded in the presence of an officer of the Customs and Excise under the provisions of rule 6 above) and shall not unload the goods except between such hours as the Commissioners prescribe, or remove the goods from an examination station unless the goods have first been duly entered in manner provided by these rules and produced to the proper officer of Customs and Excise and duly cleared by him.

12. No person shall remove from any aircraft any goods imported therein until the report required by rule 7 (above) has been made, and the authority of the proper officer of Customs and Excise has been obtained.

13. The importer of any goods imported in aircraft shall deliver to the collector of Customs and Excise in whose district the aerodrome of importation is situated an entry of such goods in accordance with the provisions of the Customs Acts, and shall truly furnish thereon the several particulars required by the form of entry, and shall pay to such collector all duties chargeable thereon at the times and in the manner prescribed by the said Acts ; provided that no entry shall be required in respect of diamonds or bullion or the baggage of passengers.

14. All goods imported into an appointed aerodrome in any aircraft shall be duly entered and unladen within seven days from the time of the arrival of such aircraft at that aerodrome or within such further period as the Commissioners may allow.

15. All goods imported in aircraft which have not been examined and cleared by the proper officer of Customs and Excise shall be stored in a transit shed at the appointed aerodrome, and no person shall remove such goods from the transit shed before examination and clearance by such officer.

## Notes on "Civil Aviation"

### Exportation of Goods.

16.—(i) The exporter of any goods intended for exportation in aircraft shall deliver to the proper officer of Customs and Excise at the appointed aerodrome from which such aircraft is cleared to its foreign destination, an entry in the form prescribed by the Commissioners, and shall truly state in such form the particulars hereby required ; and such form when signed by the proper officer of Customs and Excise shall be the clearance and authority for the exportation of such goods.

(2) No person shall export goods on such aircraft until such authority has been given by the proper officer of Customs and Excise.

17. No person shall without the consent of the proper officer of Customs and Excise unload from any aircraft any goods loaded thereon for exportation which have been cleared under rule 16 above, or open, alter, or break any lock or mark or seal placed by any officer of Customs and Excise on any goods in any aircraft about to depart from the United Kingdom.

### General Provisions.

18. No person shall make any signal to or from an aircraft entering or leaving the United Kingdom except such signals as are authorised by these regulations ; provided that no offence shall be deemed to be committed under this rule if the person making such signal proves that the signal was not given for the purpose of evading or of assisting any person in evading these rules.

19. If any officer of Customs and Excise in the execution of his duty boards any aircraft in any place, the pilot thereof shall not convey him in the aircraft away from such place without his consent.

20. No dutiable goods shall be removed in aircraft from the Isle of Man to Great Britain or Ireland except from an appointed aerodrome and with the consent of the proper officer of Customs and Excise.

21. If any aircraft arriving from a place outside the United Kingdom, shall land in any place other than an appointed aerodrome, the pilot shall forthwith report to an officer of Customs and Excise or police constable, and shall on demand produce to such officer or police constable the log-books belonging to the aircraft, and shall not allow any goods to be unloaded therefrom without the consent of an officer of Customs and Excise, and no passenger thereof shall leave the immediate vicinity without the consent of an officer of Customs and Excise or police constable. If such place of landing shall be an aerodrome the pilot shall forthwith report the arrival of the aircraft and the place whence it came to the proprietor of the aerodrome, and the proprietor of the aerodrome shall forthwith report the arrival of the aircraft to an officer of Customs and Excise, and shall not allow any goods to be unloaded therefrom or any passenger thereof to leave the aerodrome without the consent of such officer.

22.—(i) The proprietor of any aerodrome shall at all times permit any officer of Customs and Excise to enter and inspect his aerodrome and all buildings and goods thereon.

(2) The pilot of any aircraft shall permit any officer of Customs and Excise at any time to board and inspect his aircraft and any goods laden thereon.

(3) The importer or exporter of any goods imported or exported in aircraft shall produce such goods to the proper officer of Customs and Excise at the aerodrome of importation or exportation, as the case may be, and permit him to inspect such goods.

23. Any provisions for the time being in force of the Aliens Restriction Order or of the Defence of the Realm Regulations with respect to persons arriving in or departing from the United Kingdom by sea, shall apply to persons arriving or departing by air as if the same were herein set out, with such modifications as are necessary for adapting them to such purpose, and in particular with the substitution of " appointed " aerodrome for the approved ports specified in the Aliens Restriction Order.

24. All persons importing or exporting or concerned in importing or exporting goods, mails, or passengers into or from the United Kingdom in aircraft and all pilots of aircraft arriving in or departing from the United Kingdom shall observe and comply with the provisions of sections 53, 76, 102, 104, and 118 of the Customs Consolidation Act, 1876, as if any references in such provisions to ships or vessels and the masters or captains thereof, and to the loading or unloading of goods thereon or therefrom, included references to aircraft and the pilots thereof, and to the loading or unloading of goods thereon or therefrom, and as if references in such provisions to a quay included a reference to an examination station.

Before the war there were signs and tokens that the doctrine of sovereignty was winning the day.

## Notes on "Civil Aviation"

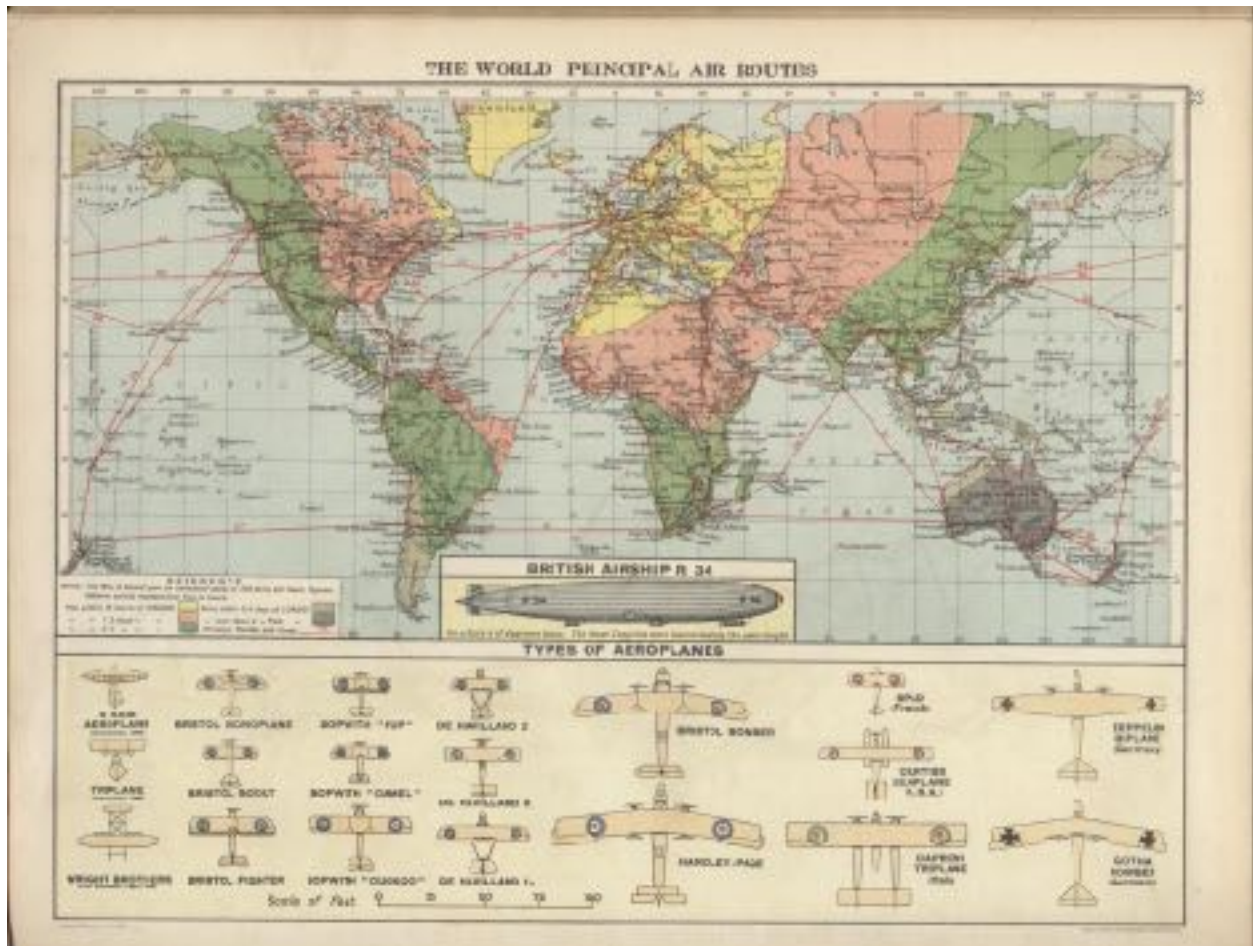

The British Aerial Navigation Acts of 1911 and 1913 assumed for Great Britain "the power to close her aerial frontiers" and regulations issued by the Home Office under those Acts forbade the passage of aircraft over great tracts of the coast-line of Great Britain.

Germany and France similarly prohibited the crossing of extensive portions of their air frontiers.

The closing of the air frontiers was the occasion of much concern to the champions of flight.

**BRITISH AVIATION 1920'S - 1930'S**

Throughout the 1920s and into the 1930s the work of the RAF was very much tied up with the development of British civil aviation: the directorate of civil aviation was, in these early days, a part of the Air Ministry. A major consideration for the RAF was that of establishing an international reputation for long-distance, high-altitude and high-speed flying so that it could develop and show its operational and technical prowess.

1924 - In order for the British Government to develop commercial air transport on an economic basis. "Civil Aviation" in the form of a government air-line was established throughout the Empire as the "Imperial Airways" along the same system of the steam-ship lines.

The R.A.F had cut its teeth for this work by operating the air mail and passenger service from London to Paris for government officials attending the Peace Conference in Paris in 1919.

The R.A.F had also operated an air mail service during WW1 to the British troops of the Army of Occupation in Germany.

Imperial Airways first major route, Cairo-Baghdad, officially launched in 1921 using DH9A's and Handley Page 0/400s The Cairo-Baghdad run became so important to the British Government that it was the first overseas sector and basis for the routes of Imperial Airways in 1927.

The routes to the Far East and the Orient were the province of the flying boats.

One of the most outstanding of all pioneering flights was that made by 4 Southampton flying boats in 1927-28.

They left Plymouth to become the nucleus of No 205 Squadron at the new RAF base in Singapore.

They flew in formation to Singapore, on to Australia and finally Hong Kong. They then flew back to Singapore - and all of these flights were "on time".

---

AIR MINISTRY Air Publication 1208 - Airworthiness Handbook for Civil Aircraft VOL. II - INSPECTION

---

FOREWORD - GENERAL

I. Application of volume.-

(i) *This volume of the handbook is issued as a guide to the inspection of:*

1. Type aircraft that are:
  1. designed to carry more than ten passengers for hire or reward
  2. constructed to carry more than ten passengers for hire or reward, or
  3. intended to carry more than ten passengers for hire or reward, or
2. Type aircraft that have a maximum permissible weight of more than 10,000 lb.

*It also covers the inspection of:*

1. *a modification affecting safety on its first being incorporated in any Type, or*
2. *a modification affecting safety on being incorporated in Subsequent aircraft in either of the classes indicated above.*

(ii) The handbook is intended to be read in conjunction with the Air Navigation (Consolidation) Order, 1923, and the Air Navigation Directions, 1936 (A.N.D.13) (or any Orders, Regulations or Directions replacing the same) as in force for the time being. These are purchasable from His Majesty's Stationery Office, Adastral House, Kingsway, London, W.C.2, or through any bookseller.

2. Inspection requirements.

*The general requirements stated hereunder are taken from the Air Navigation Directions, 1936 (A.K.D.13), Section II (C), para. 19. These requirements are amplified in the leaflets which form the remainder of the volume. "*

*(a) Inspection of type aircraft will be carried out by the Secretary of State, but the inspection of all details and components of such aircraft shall be carried out by the constructor, who shall provide adequate inspecting staff for this purpose. In addition, each component shall be finally inspected and approved by the Secretary of State.*

*(b) Constructors shall notify the Under Secretary of State, Air Ministry, London, W.C.2, seven days before commencing work on any part of the aircraft, the inspection of which is necessary during process of construction.*

*(c) All materials used in the construction of the aircraft shall be in accordance with the specifications approved for the type design and every batch of such material shall be proved to comply with such specification by suitable examination, sampling and testing by approved methods.*

*(d) Every detail and part must be proved by the constructor's inspecting staff referred to in (i) of this paragraph by suitable process of testing and inspection to conform strictly to the approved type design. The constructor's inspecting staff shall stamp, or otherwise provide means for the identification of, each detail and part approved by*

*them for incorporation in the aircraft, in such a way that the individual responsible for such approval can subsequently be identified.*

(e) *Only details and parts* which have been *approved in accordance with (d) of this paragraph*, or details or parts for which special "concessions" have been granted as laid down in paragraph 21, may be issued by the constructor to the shops for assembly into components.

(f) The constructor *shall maintain an efficient process inspection during the work of assembly* and record the progress of such inspection for each component. *Every component shall be finally inspected and approved by a qualified member of his inspection staff*, who shall stamp the component in such a way that *he may afterwards be identified as the person responsible*, and shall also sign the inspection record.

(g) *Operations such as* heat treatment of steels, seasoning and conversion of timber, gluing of important parts, doping, etc., *must be carried out by approved methods.*

(h) The constructor *shall ensure that all components and parts obtained* from subcontractors *have been inspected and approved in accordance with these conditions.*

(i) The constructor (of the aircraft or engine, as may be arranged) shall ensure that all engines have been inspected and approved in accordance with these conditions and have undergone, to the satisfaction of the Secretary of State, such tests as may be required by him. The constructor shall provide adequate facilities for these tests.

(j) The constructor shall satisfy the Secretary of State that the specified instruments and equipment have been manufactured, and any repairs thereto executed, under approved conditions, and

(k) The aircraft constructor shall ensure by suitable inspection that all engines, instruments and parts (including wiring for electrical equipment other than wireless apparatus) that are fitted to the aircraft are so installed as to function correctly, and, if wireless telegraphy or wireless telephony apparatus is fitted, that the installation of such apparatus, including bonding and screening, is not such as to prejudice the operation of the aircraft and is in conformity with such requirements as may have been laid down by the Secretary of State.

The individuals responsible for such inspection shall be indicated by signatures on the inspection record referred to in (vi) of this paragraph.

(l) On completion of the construction of the aircraft and of flying trials under para. 2-1, but before the carrying out of any official flying trials under para. 25, a final inspection of the aircraft as regards its fitness for flight shall be made by the Secretary of State.

(111) On completion of the whole of the inspection operations specified above, the constructor shall forward to the Secretary, Air Ministry, London, W.C.2, a summary of the inspection record of the aircraft. For this purpose, A.I.1. Form 1221 (copies of which can be obtained on application) shall be used. All the particulars required by the Form must be given."

References to handbook.-Reference to any particular portion of the handbook should be made by quoting the volume (i.e. I or II), leaflet, paragraph (or sub-paragraph) and line number.

Notices to Ground Engineers.-

Frequent references are made throughout this handbook to Notices to Aircraft Owners and Ground Engineers. A consolidated booklet of all such Notices remaining in force on the 31st December each year is issued towards the end of February of the year following.

Copies of this booklet can be purchased from His Majesty's Stationery Office or through any bookseller. Applications for copies of Notices to Aircraft Owners and Ground Engineers issued during the current year should be addressed to the Under Secretary of State, Air 1.1 (C.A.P.), London, W.C.2, and should include a statement as to the purpose for which the Notices are required.

## PART II.-BASIC PRINCIPLES OF INSPECTION

### 1. Supplies of material.

Supplies of material will normally be subject to the conditions applying in the case of aircraft intended for the Royal Air Force, i.e., their inspection, identification and release must be in accordance with such specifications and Inspection Instructions as are relevant.

### 2. Material at aircraft works.-

Material received at an aircraft works must be placed in a "bonded store" as soon as the inspector has correlated it with the release note or other evidence of prior inspection.

If for any reason this evidence is missing the material must be held in a "quarantine store" until either the release note (or its equivalent) comes to hand or the material has been completely re-inspected.

### 3. Identification of material.

A job card or similar document, indicating the relevant release note or other evidence of prior inspection, must be started when material is issued from the bonded store to the workshops.

The records of subsequent inspection shall enable the source of the material and the various inspectors concerned with any part made therefrom to be identified at any time.

### 4. Inspection.-

(i) The value of the inspection of an aircraft depends :-

(a) upon the skill and care with which each inspection operation is performed ; and

(b) upon every detail and assembly being systematically followed through from the raw material to the finished product.

(ii) The grant of a certificate of airworthiness can be recommended only when the inspector is fully satisfied that each operation in the complete series has been performed efficiently.

### 5. Inspectors' stamps.-

(i) Every inspector must be provided with stamps for marking the materials or articles which he will be called upon to inspect. The identity of the inspector must be ascertainable from these stamps.

(ii) The inspector's mark on an article or on the inspection document relating to an article signifies that the article, when examined by the inspector, was found to be in a satisfactory condition.

(iii) Before passing any article the inspector must be satisfied that :-

(a) the material complies with the requirements specified on the approved drawings (see Vol. I, Design Leaflet B.1, paras. 4 and 5) and has received the requisite process treatment;

(b) the part is dimensionally accurate and satisfactory as regards its finish;

(c) the material has not been subjected to any improper treatment and is free from defects.

(iv) The inspector must also satisfy himself that all detail parts are properly fitted and secured during the assembly of an aircraft, and, finally, that the complete aircraft is in all respects airworthy.

By direction of the Secretary of State for Air,

Engine Power and Height, H. T. Tizard. Engineering, vol. 108. no. 2808, Oct. 1919, pp. 561-563, 5 figs. Examination of performance tests of airplanes and bench tests made under artificial altitude conditions in order to determine whether or not density of charge entering cylinder is proportional to density of external atmosphere. It is concluded that "no good ease can be made out at the present time for abandoning the standard method of reducing performances in favor of one which assumes that engine power is independent of atmospheric temperature." Paper read before Eng. Section of British Association for Advancement of Sci.

Afternoon Session, Thursday, January 29th.

Vice President Mitchell, who occupied the chair, called the meeting to order and asked Lieut.-Col. O. M. Biggar, Vice Chairman of the Air Board of Canada to address the meeting on the subject of aviation "The Policy of the Air Board of Canada". Col. Biggar's address is published in full in this issue of The Journal.

Frederick B. Brown opened the discussion stating that there were two gentlemen present who had made a special study of the subject and who were in a position to do so from the viewpoint of expert knowledge. He suggested that we hear from Gen. Mitchell, who had been studying the matter for twenty odd years and from Prof. McKergow, one of whose subjects at McGill University was aeronautics.

Brig.-Gen. Mitchell traced briefly the development of aerial navigation from the time of the Chicago Exhibition when he had begun to study it at which time we knew nothing about the problem of aero-dynamics or about the scientific principles underlie the aeroplane as we now have it. The stabilizing of the aeroplane had been developed in the early days of the war a very important feature of the aeroplane service was due to the fact that it was possible to keep in constant communication with headquarters. Such was the development of the aeroplane and so important was the science becoming that it would soon be necessary to consider a new section of The Institute's activities in which the automotive engineer would find a place. The Institute should also consider to what extent it would take part in this new development.

Major C. M. McKergow, Professor Mechanical Engineering, McGill University, congratulated Col. Biggar on the excellency of his address and stated that he was interested in the aeroplane rather than in aerial navigation. His work had been concerned with making the aeroplane more efficient, the engine and the materials which go to make the plane itself. As an engineer he considered there were two functions of the aeroplane which were most important, namely, for forest protection and surveying. This was now being done in Quebec with remarkable success. For exploration work, plotting out new territory and forest ranging the difficulties incidental to the use of the aeroplane for these purposes

liad been overcome. It is possible that the Federal Government may adopt these methods. He trusted that the Air Board would in their study of their problems realize that the aeroplane must be more perfect in the engine and in the parts, that an impetus should be given to research in metallurgy to develop stronger materials, to improving carburetion and ignition, or possibly eliminating them entirely in an engine, whereby the engine will be one hundred per cent efficient as regards economy and shall give one hundred percent of service, using materials that will not corrode. He believed it was within the limits of metallurgical research to develop materials of strength exceeding those we have at present and if sufficient opportunity were given to the skilled, engineer who was fond of that type of work that an engine might be developed which would eliminate the carburettor and the sparking device, which he understood gave about sixty-eight percent of all troubles in the air. It spoke well of the mechanical part of the construction that the materials, bearings, etc. gave very little trouble. He felt that this wonderful romantic thing capable of flying through the air was worthy of every engineer's earnest consideration.

Col Biggar replied that during the past three months the Air Board had been in communication with the Research Council of Canada on the subject of aeronautical research and that arrangements had been completed for the appointment of an Air Research Council in connection with the Research Council of Canada which body was holding its organization meeting next week. The Air Board would welcome suggestions with regard to directions in which research might usefully be undertaken.

The reading of his paper "The Pulp and Paper Industry" by Ferd. van Bruyssel, followed by the "Forests of Quebec" by G. C. Piche, A.M.E.I.C, Chief of Forests Service, Quebec Lands and Forests Department, concluded the afternoon session.

Taking advantage of the occasion presented by the Annual Meeting the engineering graduates of the University of Toronto held a "get together" luncheon at the Windsor Hotel at noon on Thursday with over fifty graduates present. This occasion will long be remembered by the graduates and was historic inasmuch as it saw the formation of the Engineering Alumni Association of the University of Toronto with the following officers:

—  
President, Walter J. Francis, M.E.I.C; Vice President, Dr. T. K. Thomson, M.E.I.C; Secretary, C. E. Macdonald; Council, J. M. Robertson, M.E.I.C, J. B. Challies, M.E.I.C, E. R. Gray, A.M.E.I.C, J. L. Morris, M.E.I.C, G. Reid Munro, A.M.E.I.C, W. G. Chace, M.E.I.C and W. A. Buck, A.M.E.I.C. It was decided to hold a general re-union of the Engineering Alumni Association at Toronto next October. Addresses were given by President R. A. Ross, Past President G. H. Duggan and Vice President Brig.-Gen. C. H. Mitchell.

Canada Gazette - volume 53, number 30, 24 January 1920, page 34 (2324)

**CIVIL SERVICE COMMISSION OF CANADA - AIR BOARD VACANCIES**

Post No. 1 is VACANT.

List No:

The Civil Service Commission of Canada hereby gives public notice that applications will be received from persons qualified to fill the following positions under the Air Board. It is proposed to form eligible lists for the various classes hereunder advertised, but it has not been decided which of the classes described below will be filled, or the number of appointees of any class who will be required. The tenure of office will be for three years, renewable. Provision will be made by the Air Board for insurance against injury or death due to accident while on or about air craft,

**AIR STATION SUPERINTENDENT.**

Initial Salary \$3,300 per annum.

932. An Air Station Superintendent for the Air Board at an initial salary of \$3,300 per annum which will be increased on recommendation for efficient service at the rate of \$180 per annum until a maximum of \$3,900 has been reached.

Note: If board, lodging, or ordinary clothing is supplied the value thereof shall be deducted from the above compensation.

Qualifications:

Education equivalent to university graduation: at least two years of flying experience; must hold or obtain commercial pilot's and navigator's flying machine certificates or airship pilot's and navigator's certificates; thorough knowledge of the theory of flight and the principles and practice of air navigation; wide acquaintance with all types of aircraft accessories and equipment and their use; administrative and organizing ability; good physical condition.

Duties:

Under the direction of the Director of Flying Operations of the Air Board, to have charge of an air station and to direct the work at flying sub-stations; to direct or personally undertake flying operations; to supervise the staff and be responsible for the maintenance and repair of aircraft and equipment at a flying station; to supervise the care and issue of stores; and to perform other related work as required.

**AIR SUB-STATION SUPERINTENDENT,**

Initial Salary \$2,940

Per Annum.

833. An Air Sub-Station Superintendent for the Air Board at an initial salary of \$2,940 per annum which will be increased on recommendation for efficient service at the rate of \$180 per annum until a maximum of \$3,300 has been reached. This initial salary is supplemented during the present fiscal year by the following bonus: If head of a household (irrespective of age) \$100 per annum.

Note: If board, lodging, or ordinary clothing is supplied the value thereof shall be deducted from the above compensation.

Qualifications:

Education equivalent to university graduation; two years of flying experience; must hold or obtain commercial pilot's and navigator's flying machine certificates or airships pilot's and navigator's certificates; thorough knowledge of the theory of flight, the principles and practice of air navigation, and the administration

and organization of air work ; ability to carry out flying operations ; good physical condition .

Duties :

Under direction, to have charge of an air station;  
to direct or personally to carry out flying operations ; to supervise the staff and be responsible for the maintenance and repair of aircraft and equipment at a flying station ; to supervise the care and issue of stores ; and to perform other related work as required .

## **AIR EQUIPMENT OFFICER**

Salary of \$2,400 per annum.

834. An Air Equipment Officer for the Air Board at an initial salary of per annum which will be increased on recommendation for efficient service at the rate of \$120 per annum until a maximum of \$2,400 has been reached . The initial salary is supplemented during the present fiscal year by the following bonus :  
If head of a household (irrespective of age) \$ 150 per annum.

Note : If board, lodging, or ordinary clothing is supplied the value thereof shall be deducted from the above compensation .

Qualifications :

1. Education equivalent to high school graduation  
two years of experience in charge of flying equipment  
preferably as Equipment Officer in the British Air Force ;  
Knowledge of markets, current prices, commercial  
production, and transportation facilities ; thorough  
knowledge of aircraft equipment and stores and wide  
knowledge of air station requirements ; administrative  
and organizing ability ; integrity.

Duties :

Under direction, to purchase and have charge of aircraft, engines, spares, hangars, workshop, machinery, general stores and other aircraft equipment ; to be responsible for the allocation of all such equipment  
Notes : to make arrangement for the issue, transportation, care, and maintenance of such equipment  
and to perform other related work as required .

## **AIR PHOTOGRAPHIC INSPECTOR**

Initial salary \$2,340 per annum.

835. An Air Photographic Inspector for the Air Board at an initial salary of \$2,340 per annum which will be increased on recommendation for efficient service at the rate of \$120 per annum until a maximum of \$2,700 has been reached. This initial salary is supplemented during the present fiscal year by the following bonus : If head of a household (irrespective of age) \$180 per annum.

Note :-If board, lodging, or ordinary clothing is supplied the value thereof shall be deducted from the above compensation . Qualifications :

Education equivalent to high school graduation  
two years of photographic experience in the air, pre-

ferably in a British Air Force wide experience with the various types of aerial cameras and knowledge of modern aircraft with special relation to photographic work ; supervisory ability ; good physical condition .  
DUN":

Under direction, to organize and inspect such photographic work as may be undertaken in connection with flying operations ; to have charge of photographic supplies ; to advise as to the proper types of cameras and supplies for various undertakings and supervise their proper upkeep and repair ; and to perform other related work as required .

### **AIR WIRELESS INSPECTOR.**

Initial Salary \$2,840 per annum.

1a8. An Air Wireless Inspector for the Air Board at an initial salary of \$2,840 per annum, which will be increased on recommendation for efficient service at the rate of \$120 per annum until a maximum of \$2,700 has been reached . This initial salary is supplemented during the present fiscal year by the following bonus : If head of a household (irrespective of age) \$180 per annum .

Note : If board, lodging or ordinary clothing is supplied the value thereof shall be deducted from the above compensation.

Qualifications : Education equivalent to high school graduation ; five years of experience in wireless telegraphy, two years of which shall have been in connection with wireless telegraphy in the air ; thorough knowledge of wireless telegraphy, of wireless instruments and equipment, and of the method of installing and operating such equipment in aircraft ; supervisory ability ; good physical condition

Duties :

Under direction, to have charge of and be responsible for the inspection of wireless equipment and work which may be undertaken in connection with flying operations ; to advise as to the proper equipment for various kinds of air work ; to be responsible for the installation and operation of wireless equipment and direct its proper upkeep and repair ; and to perform other related work as required .

### **Air Navigator**

Initial Salary \$2,460 per annum.

M. An Air Navigator for the Air Board at an initial salary of \$2,460 per annum which will be increased on recommendation for efficient service at the rate of \$180 per annum until a maximum of \$2,940 has been reached . This initial salary is supplemented if the holder is the head of a household (irrespective of age) \$180 per annum .

Note : If board, lodging, or ordinary clothing is supplied, the value thereof shall be deducted from the above compensation.

Qualifications :

Education equivalent to high school graduation ; one year of experience in flying and navigating various types of flying machines ; commercial air pilot must hold or obtain it before April 1, 1914 and an air navigator's certificate ; thorough knowledge of the principles and practice of

## Notes on "Civil Aviation"

air navigation ; knowledge of flying machines, engines, and equipment ;  
ability to understand and efficiently to follow directions ;  
alertness and good physical condition .

### Duties

Under direction, to fly and navigate flying machines ;  
to take aerial photographs and perform general aerial  
observation work ; to operate wireless telegraph and telephone apparatus ; on occasion to supervise the work of employees at  
and the operations of a sub station ; and to perform other related work as required.

## AIRSHIP PILOT

Initial Salary \$2,820 per annum .  
Salary of \$23  
initial

\$2,820 per annum

air

Pilot

annum

with the Air

which will be increased

. At initial

annual salary

recommendation for efficient service at the rate of \$180 per annum until a maximum of \$2,820 has been reached. This initial  
salary is supplemented during the present fiscal year by the following bonus : If head of a household (irrespective of age)  
\$156 per annum .

Note : If board, lodging, or ordinary clothing is

expended the value thereof shall be deducted from the above compensation

### Qualifications :

Education equivalent to high school graduation ; one year of experience in flying and navigating various types of airplanes ; must  
hold or obtain commercial air pilot's and air navigator's certificates ; thorough knowledge  
of the principles and practice of air navigation ; knowledge of lighter-than-air machines and equipment ; ability to understand  
and follow instructions ; alertness and good physical condition .

### Duties:

Under direction, to have charge of and navigate airships ; to supervise the work of pilots and crews ; to supervise the  
maintenance and repair of airships and see that they are properly housed ; and to perform other related work as required .

## AIR PILOT,

Initial Salary \$1,980 per annum.

\$39. An Air Pilot for the Air Board at an initial

salary of \$1,920 per annum which will be increased on  
recommendation for efficient service at the rate of \$180

per

year. This initial salary will be supplemented during the

present fiscal year by the following bonus : If head

of a household (irrespective of age) \$252 per annum .

Expended the amount

Note

: If board, lodging, or ordinary clothing is

expended the above compensation .

### Qualifications :

Education equivalent to high school graduation ; one  
year of experience in flying various types of aircraft

## Notes on "Civil Aviation"

machines ; must hold or obtain a commercial pilot's flying machine certificate ; knowledge of aeroplanes, engines, and equipment ; ability to operate aero wireless apparatus, to take aerial photographs and to understand and follow instructions ; alertness and good physical condition

Duties :

As directed to fly flying machines ; to take aerial photographs and to operate wireless apparatus ; to perform general aerial observation work ; and to perform other related work as required .

### **AIR FOREMAN MECHANIC**

Initial Salary \$1,600 per annum.  
\$40.

An Air Foreman Mechanic for the Air Board at an initial salary of \$1,600 per annum which will be increased on recommendation for efficient service at the rate of \$80 per annum until a maximum of \$1,840 has been reached .

This initial salary is supplemented during the present fiscal year by the following bonus :

If head of a household (irrespective of age), \$348 per annum ; if not the head of a household, \$102 per annum, if over 21 years of age ; no bonus if below 21,  
but not the value thereof or deduction of clothing above compensation. from that

Qualifications ;

Primary school education ;

at least two years' of experience in the maintenance and repair of air craft and engines, preferably with at least two years of experience with internal combustion engines or as mechanic ;

must hold or obtain a certificate as an air engineer ;

thorough knowledge of the construction and design of aero engines ;

ability to supervise a staff of mechanics ;

good physical condition .

Duties :

To have charge, under direction, of the mechanical work and staff of an air station or sub-station ; to be responsible for the care, maintenance, and repair of the aircraft and engines at an air station ; to take charge of damaged machinery and be responsible for their replacement and the collection and care of their parts ; and to perform other related work as required

### **AIR PHOTOGRAPHER,**

Initial salary \$1,600 per annum.

Initial salary Air of \$1,600 per annum

to be increased on recommendation for efficient service at the rate of \$60 per annum until a maximum of \$1,740 has been reached. This initial salary is supplemented during the present fiscal year by the following bonus : If head of a household (irrespective of age), \$348 per annum ; if not the head of a household, \$102 per annum, if over 21 years of age ; no bonus if below 21, but not the value thereof or deduction of clothing above compensation.

Qualifications ;

Primary school education ; two years of experience in photography, preferably with aerial photographic apparatus ;

wide knowledge of standard types of aerial cameras ;

ability to take oblique and vertical photographs ;

ability to understand and follow instructions ; good physical condition.

Duties :

Under direction, to operate photographic apparatus in the air ;

to develop and print photographs so taken ;

to repair and maintain cameras in proper working order ; and

to perform other related work as required,

### **AIR WIRELESS OPERATOR.**

Initial Salary \$1,600 per Annum. at \$1,600 initial salary of \$1,600 per annum the Air Board

## Notes on "Civil Aviation"

increased on recommendation for efficient service at the rate of \$80 per annum until a maximum of \$1,740 has been reached. This initial salary is supplemented during the present fiscal year by the following bonus : If head of household ( irrespective of age ) \$848 per annum ; if not the head of a household,

,  
annum, if over 81 years of age ; \$102 per annum no bonus if below 21 . :

If board, lodging, or ordinary clothing is supplied the value thereof shall be deducted from the above compensation

Qualifications :

Primary school education ; a qualified wireless operator with wide experience with standard aerial wireless sets and a thorough knowledge of their design and construction ; ability to receive and send messages reliably at a rate of not less than 15 words per minute ;

Aeronautical Intelligence Officer

860. **An Aeronautical Intelligence Officer for the Air Board, at an initial salary of \$2,400 per annum, which will be increased on recommendation for efficient service at the rate of \$120 per annum until a maximum of \$2,880 has been reached. This initial salary is supplemented by whatever bonus may be provided by law.**

**Note.**—If board, lodging, or ordinary clothing is supplied the value thereof shall be deducted from the above compensation.

**Qualifications.**—Education equivalent to graduation from a university of recognized standing; at least two years of experience in the collection and distribution of publicity material or experience of equivalent character and standard, and a high degree of specialized knowledge of aeronautical subjects; administrative ability; tact and good judgment.

**Duties.**—Under direction, to gather and distribute information relative to aviation, aeronautical science, aeroplane production, and all related subjects; to supervise the preparation and editing of the Aeronautical Year Book; to assist the Secretary, Air Board, in the administration of the office, as assigned, and to act for him in his absence, and to perform other related work as required. Candidates for this position will be examined in the following subjects, which have the relative weights indicated; Education, Training and Experience, 300; Oral Interview, if necessary in the opinion of the Commission, 100.

Selections for eligible lists of applicants qualified to fill similar vacancies which may occur in future may be made from the applications for these positions.

According to law preference is given to persons

who have been on active service overseas on the military or naval forces of His Majesty, or any of the Allies of His Majesty, during the late war. The age limit does not apply to persons who have seen active service overseas, but returned soldiers must furnish a certified copy of their discharge certificates, or in the case of commissioned officers, a certified statement of their military service.

Application forms properly filled in must be filed in the office of the Civil Service Commission not later

than March 4. Application forms may be obtained from the office of the Employment Service of Canada, or from the Secretary of the Civil Service Commission, Ottawa. By order of the Commission.

W. Foran,  
Secretary. <sup>142</sup>

The Civil Service Commission of Canada hereby give public notice that applications will be received from persons qualified to fill the following positions in the Civil Service of Canada:

---

Air Certificate Examiners

Two Air Certificate Examiners for the Air Board at an initial salary of \$2,940 per annum, which will be increased upon recommendation for efficient service at the rate of \$180 per annum until a maximum of \$3,300 has been reached. This initial salary will be supplemented by whatever bonus may be provided by law.

Note: If board, lodging, or ordinary clothing is supplied, the value thereof shall be deducted from the above compensation.

Duties.—Under the direction of the Superintendent of Certificate Branch, Air Board, to examine, approve, and recommend the issue of licenses to air pilots, navigators, and engineers; to examine, approve, and recommend the issue of certificates of airworthiness of flying machines; to examine, approve, and recommend the issue of licenses to aerodromes; to assist in the selection of, and make recommendations in connection with air routes; to conduct examinations in the theory and practice of air pilotage and air navigation; and to perform other related work as required.

Qualifications.—Education equivalent to graduation from a university of recognized standing; two years of experience in flying various types of flying machines; commercial air pilot's and air navigator's certificates; extensive knowledge of the theory of flight and the piloting and design of flying machines and of the construction rigging, and overhauling of all types of flying machines and of the construction and maintenance of aerodromes; ability to conduct examinations in the theory and practice of air pilotage and air navigation and to make through inspections and investigations into the proper construction and rigging of aeroplanes and engines; and to supervise such work.

Examination.—Subjects and Weights as follows:

Education, Training and Experience, 4; Oral Interview, if necessary in the opinion of the Commission, 1.

(Sgn.) W. FORAN, Secretary. EIC - 1920

### International Aircraft Standards Commission

The Secretary reported that a Convention regarding this Commission is to be held in Paris in November, and, with the approval of the Air Board, a request has been

## Notes on "Civil Aviation"

addressed to Air Commodore R. K. Bagnall-Wild, Director of Inspection, Air Ministry, who will be one of the British Delegates, to represent the interests of the Canadian Government and of the Canadian members of the various Advisory Committees of the Commission. It is understood that at this meeting the United States will be for the first time be among the countries represented, and that the future status and activities of the Commission, together with its relation to any technical commissions or bodies operating under the Air Convention, will be thoroughly worked out.

### Representation of Air Board on Main Committee

The Secretary reported to the Main Committee the correspondence with the Air Board regarding its nomination of an ex-officio member on the Main Committee, a letter dated November 3rd, 1920, having been received requesting the appointment of Lt.-Col. E. W. Stedman, Director of Technical Staff, Air Board. Col. Stedman's nomination was welcomed, and his appointment as ex-officio member of the Main Committee was unanimously approved, such appointment to continue during the pleasure of the Air Board.

## Vancouver Branch

J. N. Anderson, A.M.E.I.C., Secretary- Treasurer.

The Vancouver Branch held a dinner on Saturday, 16th October, in the University Club, Lt.-Col. R. Leckie, D.S.O., Head of the Operations Branch, Dominion Air Board, being the guest of honour.

Earlier in the day the First Annual General Meeting of the Association of Professional Engineers of the Province of British Columbia was held, and this social meeting proved a very delightful ending to an outstanding day among Engineering events in this City.

Professor E. G. Matheson, Chairman of the Vancouver Branch, presided.

Those present were Lt.-Col. R. Leckie, D.S.O.; the following Victoria members, Messrs. A. E. Foreman, D. O. Lewis, J.B.Holcroft, H.M.Bigwood, Smith and Icke; the following Vancouver members and engineer friends:

Major R. W. Brock (Dean of the Faculty of Applied Science, University of B.C.), Major W. G. Swan, D.S.O., Major G. A. Walkem, Major C. R. Crysdale, Messrs.

Wm. Anderson, S. Anderson, J. N. Anderson, Bates, Blackman, P. P. Brown, Connell, Creer, Dalzell, Devey, Dunbar, Frew, Frith, Irwin, Jamieson, Lighthall, Muirhead,

McMurray, Philip, Powell, H. L. Robertson, Scott, Smith, Smeltzer, Smaill, Stirratt, Swift, Snodgrass and Todd.

The only toast was that of the King.

In introducing Lt.-Col. Leckie, the Chairman congratulated the guest of honour on his epoch-making flight from Halifax to Winnipeg, a distance of over 2000 miles,

and reminded those present of the Colonel's splendid record as an airman during the War, he having been the first to attack successfully and bring down a Zeppelin from a sea-plane.

Lt.-Col. Leckie, in opening his remarks, said he wished to speak, not as a soldier but as a citizen, and that he would confine his talk to Civil Aviation.

Then followed a most interesting description of the Halifax-Winnipeg flight, during which the audience learned of the frequent dangers and occasional humours of the undertaking, and the constant need of grim endurance.

Col. Leckie had for his companion Major Hobbs of Vancouver, to whom he paid a high tribute. The flight was made by sea-plane on account of the large areas of water in the Eastern part of Canada, it being stated that two-thirds of the world's fresh water was in Canada, largely east of Manitoba.

The organization of the Dominion Air Forces, Military and Civil, was explained, and the speaker proceeded to discuss Civil flying, pointing out that stunting, whilst of great military significance, was entirely uncalled for in civil or commercial aviation. Statistics of British and Canadian Commercial flying were quoted, showing the great strides which aviation has made, and also the safety with which large numbers of passengers have been carried, the fatalities being as low as .01 per 1000 in Britain in the course of 230,000 miles flown.

Col. Leckie has given much attention to the economic side of his profession, and his studies have led him to these findings.

The depreciation due to 'wear and tear' in highpower war type aircraft limited the life of the machine to approximately 600 flying hours, while a good pilot averaged a crash every 700 flying hours.

From this it was deduced that a war type machine put in the field for a period of six months and flown 300 hours was depreciated approximately 65 per cent, so that before flying can become a profitable business project the lifetime of a plane must be very considerably increased. Extensive alterations are therefore required in the design and construction of machines.

Before and during the War, aircraft were built of glued wood, piano wires and fabric. This was undoubtedly good business during the War, when the average life of a plane in France was 100 flying hours; but with peace conditions the speaker was of the opinion that the design and construction of aircraft was the work of the engineer, he being the most fully equipped by training to produce the necessary all-metal plane which would fulfil the conditions imposed on aircraft.

Under the terms required by the Allies, Germany was called upon to deliver to the Allies or to destroy all aircraft; but this condition has not prevented the Germans, largely engineers and chemists, from producing, since the War, many valuable adjuncts to the aeroplane, and it is known that Germany has now a large number of newly

## Notes on "Civil Aviation"

constructed, so-called commercial aircraft, and further has successfully built all-metal aeroplanes.

The speaker stated that he was not one of those optimists who imagined the last war has been fought, and that he was fully of the opinion that the next one would be under such conditions that aircraft would be the essential arm of warfare. When it was understood that a commercial craft can be turned into the most complete military machine in about an hour it behooved Canada, if she would hold her place in the World's affairs, to consider this fact. The cost of such a vessel as H.M.S.

"Hood" would cover 800 bombing planes, a statement which, when considered, must give food for thought and at once show the full import of the civil or commercial flying machine. Unfortunately, as yet, no aircraft factories have been established in Canada, but Col. Leckie looked to the time, at no distant date, when this would be remedied and hoped that the engineer would play the most prominent part in putting Canada in the forefront of aircraft manufacturers.

A vote of thanks to Lt.-Col. Leckie was moved by Major Swan, seconded by Mr. Lewis and responded to with musical honours.

### Victoria Branch

H. M. Bigwood, A.M.E.I.C., Secretary-Treasurer.

The Branch opened its season on Thursday October 21st. with a meeting to which the public were invited,

when Colonel R. L. Leckie, D.S.O., Director of Civil Aviation, had kindly consented to speak on his experiences during the flight across Canada and on Aviation generally. Unfortunately the distinguished aviator was recalled to Vancouver on Air Board business, almost immediately after his arrival in Victoria, and so was unable to attend,

but he had prevailed upon Major Hobbs, who had been his companion during the first stage of the flight, from

St. Johns to Winnipeg, to take his place and address the meeting in his stead. Major Hobbs opened his remarks by outlining the organization of the Air Board at Ottawa, and gave a short synopsis of the work of the three branches, Military, Civil and Operations. Speaking of the flight across Canada, the speaker stated that they had hoped to get through sooner, but that bad weather had held them up time after time.

The actual flying time was 48 hrs. 20 minutes for the journey of about 3300 miles, from the Atlantic to the Pacific. Ill-fortune overtook them soon after leaving St. John's

when they ran into a gale blowing fifty miles an hour. Fog and engine trouble delayed them at various times between Ottawa and Winnipeg.

The portion of the flight from Winnipeg to the Coast was not dealt with by the Major, who had not taken part in it, and the reports of which were not at the time complete, but it had been completed satisfactorily and without difficulty.

The use of wireless to give an aviator his location was described, and the work of the R.N.A.S. during the war was touched upon, patrols upon the "cobweb system"

## Notes on "Civil Aviation"

being described.

In speaking of the construction of aeroplanes the Major said that it was necessary to get away from the flimsy construction of the essentially war-time machine and standardize a type which would deteriorate less rapidly.

Figures were given to show that aerial travel was not the dangerous experience people generally supposed, in England where a year's figures were available the proportion of passengers killed to the number carried was one per thousand. At present Canadian casualties were three times this number, but this condition would soon be remedied.

The vote of thanks to the speaker was proposed by Mr. Yarrow and seconded by D. O. Lewis, M.E.I.C., the mover recalling the pioneer journeys across the continent in earlier days by wagon and railway; he reminded his audience that this flight just completed was also a pioneer adventure.

Depreciation. Aircraft Depreciation. The Air Board of Canada, Bui. no. 1, May 1920, 6 pp. Also Flight, vol. 12, no. 40, Sept. 30, 1920, pp. 1039-1040 and Aeronautics, vol. 19, no. 363, Sept. 30, 1920, pp. 246-247. It is calculated that total allowance in computing cost of operations or insurance and depreciation upon new machines valued at \$10,000 and used for a period of six months during which it was flown 300 hr. should be \$6786, or 674/s per cent of value of machines.

Communications have been addressed to the Air Board (Canada) with the view of obtaining for the Sectional Committee on Aircraft Parts proper governmental recognition as the Canadian section of the International Aircraft Standards Commission. If this approval is given, the C.E.S.A. Committee will have the same recognition from the Canadian Government as the British Government has given to the corresponding Committee of the B.E.S.A.

January 29th, 1920 Annual and Professional Meeting- THE ENGINEERING INSTITUTE OF CANADA, Montreal

January 27th, 28th and 29th, 1920 : "AVIATION" "The Policy of the Air Board of Canada," by Lieutenant-Colonel O. M. Biggar, B.A., K.C., Vice-Chairman of the Air Board of Canada.

### Afternoon Session, Thursday, January 29th.

Vice President Mitchell, who occupied the chair, called the meeting to order and asked Lieut.-Col. O. M. Biggar, Vice Chairman of the Air Board of Canada to address the meeting on the subject of aviation "The Policy of the Air Board of Canada". Col. Biggar's address is published in full in this issue of The Journal. Frederick B. Brown opened the discussion stating that there were two gentlemen present who had made a special study of the subject and who were in a position to do so from the viewpoint of expert knowledge. He suggested that we hear from Gen. Mitchell, who had been studying the matter for twenty odd years and from Prof.

McKergow, one of whose subjects at McGill University was aeronautics.

Brig.-Gen. Mitchell traced briefly the development of aerial navigation from the time of the Chicago Exhibition when he had begun to study it at which time we knew nothing about the problem of aero-dynamics or about the scientific principles underline the aeroplane as

we now have it. The stabilizing of the aeroplane had been developed in the early days of the war a very important feature of the aeroplane service was due to the fact that it was possible to keep in constant communication with headquarters. Such was the development of the aeroplane and so important was the science becoming that it would soon be necessary to consider a new section of The Institute's activities in which the automotive engineer would find a place. The Institute should also consider to what extent it would take part in this new development.

Major C. M. McK<sup>rgow</sup>, Professor Mechanical Engineering, McGill University, congratulated Col. Biggar on the excellency of his address and stated that he was interested in the aeroplane rather than in aerial navigation. His work had been concerned with making the aeroplane more efficient, the engine and the materials which go to make the plane itself. As an engineer he considered there were two functions of the aeroplane which were most important, namely, for forest protection and surveying. This was now being done in Quebec with remarkable success. For exploration work, plotting out new territory and forest ranging the difficulties incidental to the use of the aeroplane for these purposes had been overcome. It is possible that the Federal Government may adopt these methods. He trusted that the Air Board would in their study of their problems realize that the aeroplane must be more perfect in the engine and in the parts, that an impetus should be given to research in metallurgy to develop stronger materials, to improving carburetion and ignition, or possibly eliminating them entirely in an engine, whereby the engine will be one hundred per cent efficient as regards economy and shall give one hundred percent of service, using materials that will not corrode. He believed it was within the limits of metallurgical research to develop materials of strength exceeding those we have at present and if sufficient opportunity were given to the skilled, engineer who was fond of that type of work that an engine might be developed which would eliminate the carburettor and the sparking device, which he understood gave about sixty-eight percent of all troubles in the air. It spoke well of the mechanical part of the construction that the materials, bearings, etc. gave very little trouble. He felt that this wonderful romantic thing capable of flying through the air was worthy of every engineer's earnest consideration.

Col. Biggar replied that during the past three months the Air Board had been in communication with the Research Council of Canada on the subject of aeronautical research and that arrangements had been completed for the appointment of an Air Research Council in connection with the Research Council of Canada which body was holding its organization meeting next week. The Air Board would welcome suggestions with regard to directions in which research might usefully be undertaken.

The reading of his paper "The Pulp and Paper

Industry" by Ferd. van Bruyssel, followed by the "Forests of Quebec" by G. C. Piche, A.M.E.I.C, Chief of Forests Service, Quebec Lands and Forests Department, concluded the afternoon session. - The Journal of The Engineering Institute of Canada April 1917 Volume III, No. 4

## THE POLICY OF THE AIR BOARD IN CANADA

Colonel O. M. Biggar, B.A. K.C., Vice-Chairman of the Air Board of Canada

### Development of Aviation

The development of air transportation proceeded extraordinarily slowly for a good many centuries and has proceeded with extraordinary rapidity during the last century or thereabouts. The development of the internal combustion engine, has really made possible the development of air navigation during a comparatively short time. In 1914 we turned our whole attention, so far as air navigation was concerned, to the development not of a machine for developing the civil social life of the world but a machine of destruction, and these last five years have given an extraordinary impetus, and at the same time an extraordinary change in direction to the development of air navigation.

### Effect of the War

During these five years war urgency really had two favourable effects. In the first place the money available for air navigation became practically unlimited. Whatever it seemed well to do the money was available to carry out. No considerations of finance intervened to prevent the undertaking of any experiment which promised useful results, and no money lacked for the actual construction of machines which looked as though they had a military value. The situation also had this result, that so far as advertising went the public became completely familiar with the possibility of transport by air.

It probably became more familiar in those five years with that possibility than it would have done in a quarter of a century of peace. Those two results of the intervention of the war at the time that it did intervene in the development of air navigation had probably a greater effect in the two directions of supplying money and of advertisement than could have been obtained in five times five years of peace. But the war also had another result which was not quite so favourable, although this by no means balanced the advantages to which I have referred.

It had this effect, that *the Government* having been *during the war the only employer of air personnel*, the only purchaser of aircraft, *the public at large after the war was left under the impression that the whole matter of air navigation was a subject for action by the Government and the Government alone.*

The expenses have now, however, in peace time become a matter of very much more considerable importance and the probability is — I might almost say the certainty is, — that hereafter we shall find that it is much more profitable from the point of view of society generally that the Government's relation to the development of air navigation should be rather that of generating a little current only to serve to throw the proper switches of the local generating stations, which must be supplied with power by individuals and by groups of individuals acting independently altogether of the Government activities.

There is another thing that also has had its bearing upon *air navigation during the war* and that is this: air navigation being a matter of purely military importance, there grew up in every belligerent country a tremendous military interest in air navigation, and curiously enough, having regard to the extent to which aviation has developed before the war, *there was after the war in existence in every country a military air organization but no civil air organization.*

If you just think a moment you will remember that the Air Ministry in England came into existence only through the war and, at the time of its inception, only for the purposes of the war.

*In France the whole matter of aviation was under the direction of the War Department.*

*In the United States even to day the whole interest in aviation, the only interest in aviation, is centered in the Departments of War and the Navy. There is not any civil air organization.*

*In England, on the other hand, there came into existence after the war a civil air organization, but it came into existence as a sort of an excrescence on the Military Air Ministry.*

## Notes on "Civil Aviation"

*In France I think the situation is still that the air administration is under the War Department.*

Generally speaking, *the situation common to all the belligerent countries was that the military organization which came into existence for the purpose of the war continued to deal with aviation after the war either directly or through some small auxiliary organization.*

### Civil Aviation after the War

*Canada was in a completely different position from any other belligerent in that respect.*

*Canada came out of the war without any air organization in Canada at all.*

*The only air organization that there was, that was "Canadian" in character, consisted of two squadrons which formed part of the Canadian Expeditionary Force.*

Those squadrons were in England; they were administered by the Department of Overseas Military Forces of Canada, and they had no counterpart as far as organization went in Canada.

I am speaking about that because there was a widespread misunderstanding to the effect that those squadrons were not Canadian organizations at all, but were two squadrons of the Royal Air Force that were formed from Canadian personnel.

That is not the case.

The fact was that those two squadrons were exclusively Canadian in character, were organized by the Canadian Overseas Department, paid for by Canada and had an exclusively Canadian character.

*Then in May last year it was proposed to bring those squadrons back to Canada to form the nucleus of an air organization here.*

*The Government decided against that, and the result was that those squadrons were demobilized in England just as the rest of the Canadian Expeditionary Force was demobilized.*

*None of the squadrons came back as "formed" organizations.*

Instead of bringing them back the Government decided to create a new civil organisation to set up a completely new body which would deal with all air matters.

### Formation of the Air Board in Canada

The result was the formation of the Air Board, which in effect constitutes a new department of Government, at the head of which is one of the Ministers of the Crown. The personnel of the Air Board was selected from among men who were already in the public service in various departments for the purpose of getting something done, of getting an air administration which could carry on and do the preliminary work of organization.

*It is probable that the re-organization of the Air Board (air Force) on a permanent footing will take place before very long.*

The work that has been done is of an important character and it is of three different kinds. Different from every other air organization, the air organization thus formed was given control of the air in all its aspects.

There is no other department of the Government that is interested in anything above the earth; the whole atmosphere comes under the direction, so far as it can be directed, of the Air Board.

The Board:

1. has exclusive jurisdiction to form a military air force;
2. has exclusive jurisdiction over the administration and regulation of civil flying of all kinds;
3. has exclusive jurisdiction to operate such air services as are necessary to be operated for any government purposes, and in this respect has to some extent the character of a taxicab company.

### Work of the Air Board

Now, something has been done by the Air Board along each of these three lines.

In the first place, it has put forward a scheme for the organization of a military air force. This scheme is still under consideration. It is not known yet whether it will be found possible to adopt it.

The question of finance, of course, enters very largely into any decision that is now arrived at, and these questions and other connected questions are under consideration by the Government.

It will depend on the decision that will be arrived at on these questions what form the military air organization will ultimately take. In the second place plans have been made for quite wide spread flying operations. For these it is proposed to use British machines no longer needed for war.

## Notes on "Civil Aviation"

The British Air Ministry on the demobilization of the British Air Forces has treated Canada with extraordinary generosity, and arrangements have been made to send to Canada one hundred heavier than air flying machines as a straight gift. In addition there are sixteen or eighteen flying machines which were presented to the Canadian forces from time to time during the war and are being replaced by the Air Ministry, so that there are about one hundred and twenty heavier than air machines that are coming from England. In addition the Air Ministry is presenting to us some eighteen airships (lighter than air craft), of different types, and a considerable amount of specialized motor transport, the whole running into very large figures, probably some five or six millions dollars. So that *we shall be extraordinarily well equipped* in the circumstances, *not only to train military airmen when authority is given for that purpose* but also to carry on our taxicab service for other departments of the Government as soon as the plans for this have been sufficiently developed.

### The Work Ahead

I think perhaps I might diverge for a moment here to tell you some results that we have arrived at in connection with the cost of those operations, and which may be interesting to you as engineers. We have made very careful calculations of the probable expense of flying and the results that we have arrived at are somewhat remarkable.

### The aircraft

I am speaking particularly of the heavier than air craft, because it is those to which we have been directing our attention = the aircraft of to day is a machine with a somewhat uncertain engine in it, not as certain at all events as we would like to have it, and is built up of wood and wire and cloth, with the result that the chance of breakdown and depreciation is very high.

The best figures that we have been able to arrive at indicate that, out of the total expense of a given series of air operations, somewhat *between sixty and eighty per cent is to be put down to depreciation and insurance against accident.*

An enormous proportion, as you will agree. It is true that the experience we have to guide us is almost exclusively a war experience, but every allowance has been made for that, and, making those allowances, we have come to the conclusion that the probable rate of depreciation for obsolescence alone is three per cent per month, and that so far as flying is concerned the rate of insurance against accident for which we must allow is pretty nearly one-quarter, perhaps one-fifth, but probably nearer one-quarter per cent for every hour of flying; so if you take a ten thousand dollar machine, you have somewhat about twenty to twenty five dollars an hour to set aside to meet the chance of that machine breaking down either wholly or partly.

Finally we have come to the conclusion that the allowance that must be made for actual deterioration due to flying, not from accident but from ordinary use, runs from one quarter down to one-sixth of one per cent for every hour of flying, so that you see it is not difficult to get up to between sixty and eighty per cent of the total expense of given operations to cover those extremely heavy charges.

*It follows very clearly that the development of flying at the moment depends almost wholly upon the engineer; at all events it depends to a proportion of sixty to eighty per cent on the engineer if the figures I have given are correct, and I have every reason to believe they are.*

We must develop an engine to show a factor of safety so high that we can reduce that enormous charge for insurance against accidents. We must also develop a machine which is not subject to that very high deterioration in flying. Those are both purely engineering problems, and upon their proper solution I think there is no doubt the future of flying almost wholly depends, I mean, flying for civil purposes.

There is just this further to be said in fairness.

All the machines that have been developed up to the present time have been machines that were to be exposed to war risks. Consequently a construction which resisted deterioration was not of the first importance and as war risks were to be undertaken by the personnel, the construction which gave a high factor of security against accidents was not of the first importance. Now those two things have become of the first importance, and the solution of the problems of the increase of safety, and the extended life of the craft are of very great moment indeed.

### Regulation of Civil Aviation

The third thing to which the Air Board has directed its attention, and at which it has been working for some time, is the performance of its third duty, that of regulating flying of all kinds, of regulating civil flying.

There was published recently in the Canada Gazette what are known as "Air Regulations, 1920," which are published in book form with the Air Board Act, with all the forms which it is proposed to use under the regulations, and with the provisions of

## Notes on "Civil Aviation"

the Convention relating the International Air Navigation, which were discussed and settled in Paris at the same time as, though not as part of the Peace Treaty.

The Commission which drafted the Convention was part of the Peace Conference Organisation, although the Convention itself was not a necessary part of the peace negotiations.

To give you an outline of the character of the provisions of the Regulations, arrangements are made for registering every aircraft that goes into the air except for the purpose of test or experiment.

Only aircraft registered, either in Canada, or in some country with which Canada has a convention, or in some other of His Majesty's Dominions have the right to fly over any part of Canada.

The Air Board has laid down certain fixed specifications for air harbours of all kinds and it is hoped air harbours will be established widely, and that they will be very numerous, because upon their number really depends the future of flying. The air harbours used for any commercial purposes are required to be registered, although those that are only used by private persons for their private aircraft do not require registration.

Then provision is made for the licensing of all the personnel that goes into the air, not only pilots of all kinds, pilots of flying machines and pilots of airships and balloons, but also navigators and engineers.

Then there are provisions for the enforcement of customs laws.

There are provisions with regard to the rules of the roads, both in the air and on the ground, and with regard to lights and signals, these *being taken from the International Convention, and being therefore likely to be the same throughout the world.*

There are also certain general provisions for returns and so on, but the result of the whole is that a complete record will be kept under the regulations of all the aircrafts and flying personnel in Canada.

*Speaking generally, the regulations follow the International Convention, which is tremendously useful although it has not yet been ratified by Canada.*

### Aerodromes

With regard to the aerodromes, two possible policies have been suggested.

One is the policy of dealing with air harbours in exactly the same way as harbours for watercraft; that is by the provision of these throughout Canada by the Government. The possibility of adopting that policy has been rejected.

There are comparatively few places situated on water that require the development of harbours. I mean proportionately to the total number of such places, and it is not altogether unreasonable for the Dominion Government to assume the duty with regard to water harbours.

To assume that duty, however, with regard to airharbours would create a situation that would be absolutely impossible. Every city, every town, possibly every village is a possible terminal or waystation for aircraft and if the Dominion Government was to undertake to provide each of these places with an airharbour, the result would be that the development would be very very slow, money would be lacking, and favouritism would have to be shown, or more probably nothing would be done either by the localities concerned or by the Government.

So that it has been definitely decided that municipalities will not be provided with airharbours, and that the intervention of the Government in the direction of providing airharbour will be confined to the provision of emergency landing grounds between municipalities on recognized air routes where the municipalities themselves have provided airharbours but are too far apart to make the route safe without the provision of emergency landing grounds.

I am quite ready to give as much publicity as possible to that decision, because I think that only if this is definitely understood can we look forward to that absolutely necessary development without which we shall not have any considerable amount of flying.

Applicants for positions under the Air Board, advertised in July, 1919, who wish to be reconsidered in connection with the positions now advertised must advise the Commission to this effect.

The positions advertised herewith are grouped in the following classes:

- 
- (a) Flying.
  - (b) Technical.
  - (c) Mechanical.
  - (d) Other appointments.

Applicants for more than one class of positions must file a separate application for each class for which they are making application. Application forms must be filed in the office of the Civil Service Commission not later than February 19. Such forms may be obtained from the Secretary of the Civil Service Commission, Ottawa, the Secretary of the Air Board, Ottawa, or the offices of the Employment Service of Canada.

By order of the Commission,  
W. Foran,  
Secretary.

At the beginning of 1920 the Canadian Air Board and Board of Management of the Canadian Air Force Association was constituted as follows (srs ref : THE CANADIAN ANNUAL REVIEW 1920) :

Chairman, Rt. Hon. A. L. Sifton ;  
Vice-Chairman, Lieut.-Col. O. M. Biggar, K.C. ;  
Director of Flying Operations, Lieut.-Col. Robert Leckie, D.S.O. ;  
Deputy Director of Flying Operations, Major Lindsay Gordon ;  
Superintendent of Certificates and Licenses, Lieut.-Col. J. Stanley Scott, M.C., A.F.C. ;  
Superintendent of Seaplanes, Major Basil D. Hobbs, D.S.O., D.S.C. ; Superintendent of Aeroplanes, Capt. Devlin ;  
Director of Technical Intelligence, Capt. F. C. Higgins ;  
Canadian Liaison Officer to British Air Ministry, Major D. R. McLaren, D.S.O., M.C., D.S.C.

Following the death of Mr. Sifton, Hon. Hugh Guthrie, K.C., M.P., became Chairman of the Board and the responsible head of its administration ;

Air Vice-Marshal Sir Willoughby Gwatkin, K.C.M.G., C.B., became Inspector-General of the Force ;  
Air Commodore A. K. Tylee, O.B.E., of Toronto, was appointed Officer Commanding the Force.  
Advisory members were

## Notes on "Civil Aviation"

Capt. Walter Hose, C.B.E., of the Royal Canadian Navy, and  
E. Deville, L.I.\*D., Surveyor-General, Department of the Interior.

The final organization of the Air Force was completed early in the year and the Chairman of the Board (Mr. Guthrie) explained its position on Mch. 16 as follows : "The Canadian Air Force is organized as a non-professional force, the personnel of which in all ranks, from the lowest to the highest, undergoes normally one month's training every two years.

Certain staff and administrative duties require for their performance a longer term, normally six to nine months, and to secure the services of competent officers and other instructional personnel for these duties, which involve absence from ordinary civil occupations for substantial lengths of time, special rates of pay are provided.

These special rates do not apply if the service of any individual is prolonged beyond one year, and the pay receivable is reduced accordingly.

The approximate weekly time-table for an air mechanic in training is as follows :  
Lectures on engines, theory of flight, rigging and construction of aeroplanes, 24 hours ;  
work in shops and on machines being flown, 20 hours ;  
other military duties, guards, drills, etc., 16 hours."

The authorized establishment was 5,000 of which 2,000 were to be officers and 3,000 other ranks; *the Force was organized as a Militia unit, its local administration was to be carried on by Provincial Executive Committees, and a training centre was to be formed in each Province.*

By this time the 100 heavier-than-air machines of different types presented by the Imperial Government, together with dirigibles and equipment, had been received at Ottawa ; amongst them were eight F3 flying boats equipped with Rolls-Royce (VIII) engines ; after repairs and adjustments to some of them they were grouped at the Camp Borden Aerodrome from which they were, later on, distributed as required for operations throughout the year ; there were, also, 12 airships and six kite balloons included in the Imperial gift. Meantime, the Canadian Air Force had received an appropriation of \$2,500,000 which was to be used in carrying out Government flying operations, civil and military, throughout the Dominion.

The maintenance of three stations was also approved at Camp Borden, Ont. ; Morley, Alta. (about 30 miles west of Calgary) ; and Jericho Beach, English Bay, Vancouver. *There was no difficulty in obtaining pilots* out of the estimated 10,000 in Canada who had seen War service, *but there was a shortage in officers, experienced in air-ship practice, and the British Air Ministry offered to loan officers for this work.*

As finally organized during the year, the Flying and Administrative Services were divided into three separate Departments :

1. The Canadian Air Force, *which was the military wing*. Military training *in flying* was undertaken at Camp Borden where each member of the Force was given training for *four weeks every two years* with, at the end of the year, about 35 officers and 65 other ranks continually under training and a dozen or more machines in constant use;
2. Civil **Government** Operations which has jurisdiction for :-
  1. the development of photographic survey of timber areas,
  2. exploration of inaccessible regions, and
  3. kindred "similar" work
3. Commercial Aviation which has jurisdiction over:
  1. all civil aviation ventures, and
  2. inspection of machines, the
  3. licensing of personnel, the
  4. survey of air routes between various points.

*In each Province there was by this time a Branch of the Canadian Air Force Association* chartered, with a permanent Secretary and three Civil members and four C.A.F. members.

*The Provincial Associations were responsible to Headquarters at Ottawa. The Headquarters at Ottawa was directly in charge of the Inspector-General and the Officer Commanding,* with J. A. Wilson as Permanent Secretary.

On Jan. 6, 1920, Regulations were issued from Ottawa to which all persons operating aircraft in Canada were compelled to conform. They provided for:-

## Notes on "Civil Aviation"

1. registration, by the Air Board, of all aircraft, and
2. the issuance of certificates to pilots without which certificate no person could fly in Canada.
3. Pilots certificates were obtainable only after applicants had satisfied the Board, by certain stipulated tests, that
  1. they were qualified to operate a machine, and
  2. had also passed a medical examination.
4. Pilots operating machines for commercial purposes require medical examinations to be passed every 6 months,
5. Private fliers require medical examinations to be passed every 12 months.
6. All registered aircraft are subject to the call of the State in time of war, and
7. During periods of war all :-
  1. Persons holding commercial pilot's certificates become members of the Canadian Air Force. What is also implemented, but not well stated is that :-
    1. Persons holding Air Engineer certificates also become members of the Canadian Air Force,
    2. Persons holding Air Mechanics certificates also become members of the Canadian Air Force
  2. air harbours are subject to the control of the military authorities,
8. machines must bear certain markings, clearly indicated in the regulations, and
9. aerodromes and seaplane stations must bear certain markings, clearly indicated in the regulations.
10. Passenger aircraft are NOT permitted to carry explosives, and
11. mails could not be carried without the written authority of the Postmaster General.
12. all aircraft flying across the international border Line are required to stop at one of the border stations for examination
13. Foreign aircraft could not conduct a business of transporting passengers or freight between points within the boundaries of Canada, but
14. Foreign aircraft can conduct a business of transporting passengers or freight between from a point in the United States to a point in Canada.

Speaking in Toronto on Jan. 9, Lieut.-Colonel O. M. Biggar told the Aero Club of Canada about the new Force and the Air Board.

1. Its foundation was due, he said, primarily to the generosity of the British Air Board in its gift of aeroplanes and equipment;
2. the Board proposed to work along various lines and amongst them to aid thinly-settled districts by doing surveying, policing,
3. fire-ranging, exploration work and, possibly, undertaking the mail service in specific districts ;
4. co-operation had been arranged with Sir Frederick Stupart for the Meteorological services, which were so vital to Aviation, in securing information necessary for flying, and
5. co-operation had been arranged with the Departments of Marine, Naval Service, and Research at Ottawa.

Lieut.-Col. Leckie pointed out why it was difficult to maintain a military air force of any size.

1. The average cost *per squadron* was about \$5,000,000;
2. the gift of aircraft to Canada was worth over \$7,000,000.
3. Aviation could not develop until the ground work had developed, except with seaplanes, for which reason the first work to be done would be the opening up of the Northern districts where there were plenty of lakes.
4. The aeroplane could not compete with the railway, but its great value would be where no railways existed.

Dr. A. B. Macallum, F.R.S., described how valuable *the Helium gas resources of Alberta and Western Canada, being the only sources of supply in the British Empire* would be in the development of air machines.

On Jan. 17 a *Canadian Air Service Association for the four Western Provinces* was organized at Calgary with

Capt. Fred. McCall, Calgary, as President,  
Capt. C. McEwan, Saskatoon, as Vice-President, and  
Lieut. T. H. Spence, Regina, as Secretary / Treasurer; the  
Capt. W. R. May, Alberta - Director  
Major A. M. Lester, British Columbia - Director  
Capt. G. R. Fleming, Saskatchewan - Director, and  
J. H. Ross, Manitoba - Director.

The objects of the Association were defined as follows:

1. to encourage mutual helpfulness, social intercourse, mental and moral improvement, amongst its members ;

## Notes on "Civil Aviation"

2. to cement the friendships and associations formed in France, Great Britain, Canada and elsewhere by its members during their service in the Great War;
3. to promote interest in aerial navigation,
4. to increase the knowledge of its members in aeronautics, to encourage aerial navigation, conferences, expositions and congresses;
5. to encourage the development of aircraft for commercial and pleasure purposes,
6. to promote the interest and welfare of the Provinces in respect of aerial navigation;
7. to establish, maintain and operate club houses for the use of the members,
8. to assist the Government in the operation of aeroplane garages and aerodromes;
9. to do all such lawful acts and things as may be found necessary or expedient in the encouragement and development of aeronautics.

During the year various voluntary organizations throughout Canada were working hard to develop public opinion and support. The Aero Club of Canada with headquarters at Toronto was active in propaganda work and endeavoured, especially, to impress various cities with the necessity of making adequate provision for an air harbour and, by the middle of the year, the following towns had applied to the Government for a representative to come and select a site :

1. Wetaskiwin, Alta. ;
2. Victoria,
3. Cranbrook and
4. Vancouver, B.C. ;
5. Winnipeg and
6. Virden, Man. ;
7. Truro, N.S.,
8. Goderich,
9. Brantford and
10. Perth, Ont. ;
11. Lloydminster,
12. Melville,
13. Regina and
14. Saskatoon, Sask.

Other Associations in Canada were as follows :

Aero Club of Canada Toronto  
Aeronautical Association of Montreal Montreal  
Air Service Association Kamsack  
Air Service Association Saskatoon  
Air Service Association Regina  
Air Service Association of B. C. Vancouver  
Air Service Association Prince Albert  
Aerial League of Canada Vancouver  
Aero League of Canada Victoria  
Aero League of Canada Montreal  
Aerp Club of Manitoba Winnipeg  
Aerial League of New Westminster New Westminster

Meanwhile, in February, regulations issued by the Air Board contained advice with regard to the establishment of aerodromes and seaplane stations and instructions as to markings which these must bear. During the next few months, under directions of the Air Board, aerodrome and landing sites were chartered across the country ; training proceeded steadily at Camp Borden where substantial, permanent buildings and 18 hangars, established as a flying base by the Imperial Government during the War at a cost of about 1,000,000, were handed over to the Canadian Air Force.

Rates of pay at Camp Borden and at other training stations which were established later on at Ottawa, Lake St. John in Quebec, Halifax, Morley in Alberta and Vancouver, were as follows (per day) :

1. Air Commodore, \$9.50;
2. group captain, \$7.50;
3. wing commander, \$6.00;
4. squadron leader, \$4.75 ;
5. flight lieutenant, \$4.00 ;

## Notes on "Civil Aviation"

6. flying officer, \$3.25 ;
7. pilot officer, \$3.00;
8. pilot officer on probation, \$2.50;
9. warrant officer, \$2.05;
10. flight sergeant, \$1.80;
11. sergeant, \$1.45;
12. corporal, \$1.25;
13. first air mechanic, \$1.15;
14. second air mechanic, \$1.00.

In August the road map of the sky for all Canada was issued by the Air Board and covered every route laid within the Dominion. In September final regulations were published based largely upon the R.A.F. model in England and, in October, it was announced that the work of the year had resulted in a chain of 27 public and commercial air harbours and 37 stations with landing facilities from Coast to Coast; 34 commercial aviation firms were said to be operating in Canada of which one of the most notable was that formed in Toronto by Lieut.-Col. W. G. Barker, v.c., D.S.O., M.C., and Lieut.-Col. W. A. Bishop, v.c., D.S.O.,

M.C. and large concerns such as Price Bros., the Laurentide, Sault Ste. Marie, and other Pulp interests were employing aircraft as helpful in their business ; in British Columbia efforts were under way to establish Air services along its 7,000 miles of coast line and to help in the Interior mining country with an Air mail service inaugurated between Victoria and Seattle on Oct. 15. Major McLaren of the Air Board, in submitting station recommendations for the Province, declared that aircraft should be especially suitable in British Columbia for fishery patrols, forest ranging, exploratory surveying, police and coastguard work.

An interesting event of the Autumn was the blazing of an Air trail across the Dominion and the continent by Lieut.-Col. Robert Leckie, Major Basil D. Hobbs and others. The two mentioned started in an ordinary type of flying boat from Halifax at 2 p.m. on Oct. 4 for a Trans-Canada flight. The objects were (1) to demonstrate the feasibility of such a flight from a commercial point of view; (2) to prove the possibilities of a fast trip from Halifax to Vancouver without undue strain on either pilots or machines; (3) to serve as a recruiting propaganda for the Canadian Air Force and to stimulate interest in aviation by commercial firms and the public generally. At Selkirk, Man., on Oct. 9 the seaplane was changed to an aeroplane and Capt. J. B. Home-Hay, M.C., and Air Commodore A. K. Tylee continued the Flight to Regina and Calgary ; thence to Vancouver Commodore Tylee was accompanied by Capt. C. W. Thompson and the destination reached at 11.19 a.m. on Oct. 17. The actual flying time for this 3,410 mile trip was 45 hours and 20 minutes ; the ordinary running time by rail was 132 hours and 10 minutes. Of course there were all kinds of delays and accidents and stoppages which only a complete ground organization, skilled experience, adequate wireless direction, finding stations and better commercial machines, with relays and air-harbours, could obviate. The flight, however, provided much useful information of climatic and geographic character. Gales of wind, broken machines, severe fogs, engine troubles of all kinds, were amongst the difficulties overcome.

1920 : F. Handley Page, the eminent British maker of aeroplanes visits Canada. and an interview with him in the Montreal Star of

07 February 1920 : CIVIL SERVICE COMMISSION OF CANADA - POSITIONS VACANT List No. 10 :

### **AERONAUTICAL INTELLIGENCE OFFICER**

Reference # 800. An Aero nautical Intelligence Officer <sup>143</sup> for the Air Board at an initial salary of \$2,400 per annum, which will be increased on recommendation for efficient service at the rate of \$120 per annum until It maximum at \$2880 has been reached.

This initial salary is supplemented by whatever bonus may be provided by law.

NOTE: If board, lodging, or ordinary clothing is supplied the value thereof shall be deducted from the above compensation .

#### Qualifications :

Education equivalent to graduation from a university of recognised standing;  
at least two years of experience in the collection and distribution of publicity material or  
experience of equivalent character and standard,  
a high degree of specialised knowledge of aeronautical subjects ;  
administrative ability ;

---

<sup>143</sup> CIVIL SERVICE COMMISSION OF CANADA - POSITIONS VACANT List No. 10 : Canada Gazette volume 53, number 32, 7 February 1920, page 49

## Notes on "Civil Aviation"

tact and good judgment.

### Duties:

Under direction,

- to gather and distribute information relative to aviation, aeronautical science, aero plane production, and all related subjects ;
- to supervise the preparation and editing of the Aeronautical Year Book ;
- to assist the Secretary, Air Board, in the administration of the Office, as assigned, and
- to act for the Secretary, Air Board, in his absence ; and
- to perform other related work all required .

Candidates for this position will be examined in the following subjects, which have the relative weights indicated :

Education, Training and Experience, 300 ;

Oral Interview, if necessary in the opinion of the Commission, 100

20 February 1920 : Canada Gazette NOTICE : Government of Canada Publications : Government publications is inserted in the Canada Gazette in conformity with Order in Council (P.C. 1522) of 28th October, 1915, which calls for the publication of such lists from week to week. When the title appears in English it will be understood that the volume is printed in English ; when the title is French, it means that the report is printed in the French language

List of Government publications published in the Gazette related to the Air Board

1. Air Administration in Canada<sup>144</sup>, <sup>145</sup>
2. Rèlements régissant la Navigation Aérienne, 1920 <sup>146</sup> (Regulations governing Air Navigation, 1920)
3. Report of Air Board for year ending March 31, 1919 <sup>147</sup>

1. Air Regulations, 1920, amended - Canada Gazette pg ref # 3436
2. Customs Air Harbours established - Canada Gazette pg ref # 3542
3. Customs Air Harbour (seaplane) established at Fredericton . N .B - Canada Gazette pg ref # 3645
4. Customs Air Harbour established at Moose Jaw • Saskatchewan - Canada Gazette pg ref # 52:19
5. Municipality of Virden, Manitoba authorized to use certain land as a Public Customs Air Harbour - Canada Gazette pg ref # 98 (143 )

29 March 1920 : Montreal, QC : In the Montreal Star F. Handley Page is quoted during his visit as saying:

1. "in the matter of licensing and controlling machines and joining in the world's international air regulations, Canada was away ahead of the United States" and that
2. "his Firm had made some very important discoveries in its research department" and that
3. "We look forward to the time very shortly when we will be able to reduce the horse-power down to a third of the present amount and get the same results ; and, similarly, we shall be able to make smaller machines of very much less horsepower than the 80 or 100 h.p. planes now in use. We anticipate being able to make a machine of 25 horsepower, carrying a pilot and passenger at 105 miles an hour for five hours, and costing about a thousand dollars."

31 March 1920 : Miss Elizabeth Regan, Clerk-Stenographer transfer to the Canadian Air Board from the Dept. of Militia and Defence becomes effective. <sup>149</sup>

## Notes on "Civil Aviation"

January 1920 : Major D. R. McLaren appointed *Attache to the British Air Board*. - British Air Board DOES NOT EXIST! Air Ministry ...

June 1920 : Commander Raymond Collishaw, D.S.O. and Bar, D.F.C., D.S.C., etc., in command of the British Air Squadron under General Denikine in South Russia, returns to Canada after a series of extraordinary adventures and exploits.

In respect to the supposed dangers of commercial aviation, the British Air Ministry published figures as to accidents in the United Kingdom during the last seven months of 1919 and they showed 35,330 flights by 403 machines with a total time in the air of 8,368 hours, during which time 593,000 miles were travelled, with one passenger killed to every 16,666 passenger hours in the air or, as it was differently put, a single passenger might expect to fly about 1,180,000 miles, equal to flying 47 times around the world before becoming the victim of a fatal crash.

12 February 1920 : Ottawa : J.A. Wilson of the Air Board states :

"The Air-Co. London-Paris mail and passenger service had been running daily for seven months with only five flights interrupted by mechanical defect. They had proved their ability to operate this service under most adverse weather conditions, through fogs and gales, and had made the cross channel flight several times when no steamers could cross. So far they had had one serious accident only, with the loss of one life. Their mileage was now over 60,000 flown at an average speed of 101 miles per hour. The London-Brussels service of the same firm during the same time carried 251 passengers and 26,000 pounds of mail and freight, also without accident, their mileage being 26,000. During the first six months of civil flying, in over 300,000 flying hours, there were only 13 accidents and two fatalities in Great Britain. Considering the lack of experience and imperfect organization, this showed the comparative safety of modern flying."

1920 : UK : Lloyds Register had set up an Aviation Department to provide a system of classification of aircraft and to compile a register of aircraft and pilots.

January 1920 : UK : The Department of Civil Aviation instituted the system of issuing "Notices to Airmen," on lines similar to the "Notices to Mariners" issued by the Admiralty.

It was announced that from Sept. 2nd, 1919, to Jan. 1st, 1920, Flandley Page Transport, Ltd., had carried 618 passengers and 16,982 lb. of freight between London and Paris, and between Sept. 26th, 1919, and Jan. 1st, 1920, had carried 251 passengers and 25,883 lb. of freight between London and Brussels.

On Jan. 8th, Messrs. Parer and Macintosh left Hounslow on a D.F.I.9 (Siddley "Puma" engine), en route for Australia.

On Jan. 10th, official particulars were published concerning the issue of airworthiness certificates to commercial aeroplanes.

The composition of the new *Council of the Institute of Aeronautical Engineers* was announced on Jan. 14th

On Jan. 21st the Committee of the Royal Aero Club passed new rules for the tests for Aviators' Certificates.

At a meeting held at Cambridge on Jan. 21st, the "Cambridge University Aeronautical Society" was formed.

On Jan. 24th Capts. Broome and Cockerell left Brooklands on a Yickers "Vimy" (Rolls-Royce engines) intending to fly to Cape Town. This machine was chartered by the Times newspaper.

On Jan. 25th this paper published a letter to the shareholders

of the Birmingham Small Arms Co., Ltd. (associated with the Daimler Co.) in which the Directors of that firm announced an amalgamation with the Aircraft Mfg. Co., Ltd.

It is important at this date to note the phrase "It (the Airco) holds and, // desirable, can retain a unique position in all matters connected with aviation." The Airco is now in the hands of its Debejiture holders.<sup>150</sup>

01 January 1920 : FAI begins publishing quarterly bulletins of interest to "Aviators"

02 January 1920 : Former RFC/RAF officers recruited for the Air Board are assembled in Ottawa.

17 January 1920 : Canada Gazette publishes :

- I. the Air Regulations,
- II. Air Board Act,

## Notes on "Civil Aviation"

III. the Convention Relating to International Air navigation and

IV. Forms to be used with these documents.

17 January 1920 : With the publishing of the "Air Regulations", the following now apply:

- A. Canadian Aircraft are now required to be certified as "Air-Worthy".
- B. All pilots, air engineers, and aircraft to be licensed with the Air Board
- C. Journey and Aircraft Log-books were to be used and kept up to date.
- D. All Pilot's Licenses were to be "Awarded" by the Air Board Certification Branch after "Study and Testing".
- E. Pilots licenses are issued on condition that the holder could be called up for Military Service.

Barker and Bishop rankled by this - Felt the Air board to onerous.. felt humiliated.<sup>151</sup>

24 January 1920 : Lt.-Col. James Stanley Scott, MC, AFC : Superintendent of the Certification Branch / Lic. of aviation personnel / Lic. of Aircraft / Lic. of harbours on land & water issues himself the first private Pilot's License in Canada.

February 1920 : Canadian Air Force assumes responsibility for investigation of all Canadian aircraft accidents (Service and Civilian). When notified by of an accident telegram, a Board of Inquiry was to be convened, the CAF then sent the local Senior Flying Officer to investigate the cause and report back. Findings of the BOI were to be forwarded to the CAF HQ which performed statistical and reporting function only.

10 february 1920 : The Aeroplane publishes an account of the entire reformation of the Aero Club of Canada, which thenceforth came under the control of practical aviators, mostly with war experience.

The formation of Bishop-Barker Aeroplanes, Ltd., in Toronto, with a capital of \$300,000, was recorded in this paper on 11 Feb. 1920

pre Feb 1918 : A. Day: Memo : "Design Requirements for Military Aircraft" ( Some Contributions to the Theory of Engineering Structures, with special reference to the Aeroplane,' April 1915, by M. Booth and H. Bolas, commonly known as 'H.B. squared')

February 1918 : Basic United Kingdom airworthiness procedures are first "published" by the UK Ministry of Munitions.

- a) "airworthiness procedures" volume known the "Handbook of Strength Calculations (**Secret and Confidential**) H.B. 806 - published by Ministry of Munitions in conjunction with the UK National Physical Laboratory) Authors Alfred John Sutton Pippard MBE FRS ( in charge of the Air Department of the Admiralty), and J. L. Pritchard, his second in command. They collaborated in the first textbook on Aeroplane Structures in English - FLIGHT International, 6 June 1968 page 858) and J. Laurence Pritchard, 122 pages (THE CAREER AND WORK OF Alfred John Sutton Pippard)

1891 : Alfred John Sutton Pippard born in Yeovil, educated at Yeovil School.

Alfred John Sutton Pippard attends Bristol University - studies civil engineering.

1911 : Alfred John Sutton Pippard Graduates Bristol University in 1911

1911 - 1913 : Alfred John Sutton Pippard spends 2 years as an articled assistant in the Bristol office of consultant engineer A.P. Cotterell.

1913 - 1915 : Alfred John Sutton Pippard becomes assistant engineer with the Pontypridd & Rhonda Valley Joint Water Board.

1915 : Alfred John Sutton Pippard appointed technical adviser to UK War Office - Admiralty - Director of the Air - air-craft Structures section. J. Laurence Pritchard is his second in command.

1915 - 1918 : Alfred John Sutton Pippard is a significant contributor within the "Structures Section" on improving the safety of UK Military aircraft - advancing aircraft structural science.

1 January 1918 : Alfred John Sutton Pippard made Member of the Order of the British Empire for his contribution to the war effort.

February 1918 : Alfred John Sutton Pippard & J. Laurence Pritchard co-author HB 806, the first textbook on Aeroplane Structures to be published in English.

23 February 1920: Handley Page Transport : Handley Page Type O/400 Ser. No. HP-07 G-EANV carrying 10 people crashes at Acadia Siding, Cape Province, SA - Damaged beyond repair in a forced landing when the rudder came out of its bearing<sup>152</sup>.

25 February 1920 : Handley Page Transport : Handley Page Type O/400 Ser. No. HP-27 G-EAMC crashes in El Shereik, Sudan during an attempt to be the first airplane to fly from London to Cape Town, South Africa.

<sup>152</sup> Aeroplane, March 2012 p. 80-81

## Notes on “Civil Aviation”

10 March 1920 : "The Aeroplane" publishes the first precis of the Canadian air navigation regulations.

25 May 1920 : Atlantic City, New Jersey, USA : The 3rd Pan-American Aeronautic Congress. A regular (wage) scale (was established) for pilots (and then also) down to *the man who handled the minor details on the ground*, was officially adopted. These rates provided for a minimum retaining fee for pilots of \$1,000, payable at \$150 a month and in force if, through no fault of his, the aviator should not fly. In addition, the following hourly pay was stipulated : For single motor ships, one to thirty hours, \$1.72 an hour; 31 to 60 hours, \$2.25; 61 to 90 hours, \$2.75; 91 to 120 hours, \$3.25; 121 to 150 hours, \$3.75. An additional 25 cents an hour was given to operators for two or more motored ships. These figures stood for two great Aerial lines one transcontinental and the other following the waterways.

27 May 1920 - FLIGHT Aerial Police for Canada? IT has been suggested by a member of the Canadian Air Board that air service stations should be established in North Saskatchewan, and aircraft used to patrol the northern areas for police purposes, and to photograph unsurveyed parts to find land suitable for farming. src FLIGHT pg 568 MAY 27, 1920

27 May 1920 - FLIGHT pg 574 - IN view of its unique character, and to show what Canada is doing, we reproduce herewith the first report of the Canadian Air Board—that for the year ending March 31, 1920.

The Canadian Air Board consists of the Rt. Hon. A. L. Sifton, P.C., K.C., Chairman ; Mr. O. M. Biggar, K.C., Vice-Chairman ; the Hon. S. C. Mewburn, C.M.G. ; the Hon. .C. C. Ballantyne; Dr. R. M. Coulter; Mr. J. A. Wilson; Mr. E. S. Busby ; while the heads of branches are Lieut.-Col. R. Leckie, D.S.O., D.S.C., D.F.C., Superintendent of Flying Operations ; Lieut.-Col. J. S. Scott, M.C., A.F.C., Superintendent of Certificates Branch ; Major A. M. Shook, D.S.O., D.F.C., A.F.C., Secretary.

1. General.—The Air Board Act was assented to on June 6, 1919, and by Order in Council dated June 23 (P.C. 1295), the Hon. A. L. Sifton was named as Chairman of the Board, Col. O. M. Biggar, Judge Advocate-General, as Vice-Chairman ; the Hon. S. C. Mewburn, Minister of Militia and Defence, as the representative on the Board of the Department of Militia and Defence ; the Hon. C. C. Ballantyne, Minister of the Naval Service, as the representative on the Board of the Department of the Naval Service, and Dr. R. M. Coulter, C.M.G., Deputy Postmaster-General, Mr. J. A. Wilson, Assistant Deputy Minister, Department of the Naval Service, and Mr. E. S. Busby, Chief Inspector of the Department of Customs and Inland Revenue, as the remaining members of the Board.

The Board was called together immediately, and considered the organisation of a staff. After consultation with the Civil Service Commission, it was decided that the work under the Board should be divided into three branches, having at their heads respectively a Superintendent of Flying Operations, a Superintendent, Certificate Branch, and a Secretary, the proposal being that the Secretary should administer the internal office organisation, that the Superintendent of Flying Operations should control all civil government flying, and that the Superintendent of the Certificate Branch should conduct that portion of the administration which related to the public and was concerned with the licensing of personnel, aircraft and air harbours. The organisation thus outlined was formally communicated to the Civil Service Commission on July 15, with a request that provision should at once be made for the appointment of these three officers and a medical officer for the Certificate Branch. No appointments were, however, made until after some time, and the first appointees assumed their duties as follows :—on November 3, Lieut.-Col. J. Stanley Scott, M.C., A.F.C., Superintendent, Certificate Branch ; on November 10, Major A. M. Shook, D.F.O., D.F.C., and Croix de Guerre, Secretary, and Capt. F. R. Smith, Medical Officer ; and on December 15, Lieut. Col. Robert Leckie, D.S.O., D.S.C., D.F.C., Superintendent of Flying Operations.

Permanent office accommodation was made available for the Board's staff only on December 24.

2. **Air Regulations.**—The only step which, before the appointment of technical officers, it was possible to take in the direction of regulating and controlling aerial navigation was to prohibit dangerous flying. An Order in Council for this purpose was passed on July 7 (P.C. 1379). The drafting of a complete set of regulations was, however, proceeded with, and was completed in time for their submission to and approval by the Governor in Council on December 31. The

## Notes on "Civil Aviation"

Canada Gazette containing the regulations was published on January 17, 1920, and at the same time there was ready for distribution a book containing not only the regulations, but also the forms settled for use under them, the Air Board Act and the Convention relating to International Air Navigation as drafted by a sub-commission constituted as part of the organisation of the Peace Conference and approved by the Supreme Council. This book has already had a wide distribution.

3. Preliminary Surveys for Operations.—In November steps were taken to have made a preliminary survey with a view to ascertaining what public services could more efficiently' and in the broadest sense more economically, be performed by air than by existing methods. Canada was, for this purpose, divided into four parts, and ex-Royal Air Force officers borrowed or temporarily employed for the purpose.

The survey was completed by the end of the year, and on January 2 these officers were assembled at Ottawa and the situation was thoroughly canvassed, with the result that it was decided that the most favourable fields for the commencement of operations were the less thickly settled and less thoroughly explored portions of Canada.

An interdepartmental conference was accordingly held on January 10. An agenda for this conference, including memoranda on the probable cost of operating aircraft and on their use for purposes of survey and for fire protection, was distributed, and a number of places were named as possible air stations, upon the utility of each of which discussion was invited.

The usefulness of this preliminary conference was reduced by the non-participation of some of the departments which it was expected would be interested, but special discussions have since been carried on with those departments which were represented and some others. Proposals have been formulated for operations next summer.

4. Scientific Research. —Among the duties imposed upon the Board is that of undertaking technical research for the development of aeronautics and of co-operating for that purpose with other institutions.

In execution of this duty, discussions took place with the Honorary *Advisory Council for Scientific and Industrial Research*, which resulted in the formation under that Council of an *Associate Air Research Committee*, which held its first meeting on February 7.

Prof. A. S. Eve, Professor of Physics at McGill University Chairman of the Committee, and

Mr. R. J. Durley, Secretary of the Engineering Standards Association, as Secretary.

Prof. J.C. McLennan, Professor of Physics of the University of Toronto, and

*Mr. J. R. Parkin, lecturer in the faculty of applied science in that university.*

*This Committee will work in the closest co-operation with the officers of the Air Board, and will co-ordinate aeronautic research throughout Canada.*

5. Meteorological Development. —The importance of meteorological information to air navigation cannot be overestimated, and arrangements have been completed with Sir Frederick Stupart looking towards the necessary developments of the meteorological reports, the undertaking of meteorological observations at air stations operated under the Air Board, and the distribution of meteorological information.

6. Wireless Installations and Navigators' Certificates. — The development of air navigation will involve a considerable extension of wireless communication, and arrangements have been made with the General Superintendent, Government Radio Telegraph Service in the Department of Naval Service, for this purpose. Air pilots who require wireless qualifications will obtain them through that department, by which will be issued licences for the necessary installations both in aircraft and on the ground. That department has an organisation extending throughout Canada, and duplication of officers is thus avoided. Like arrangements are expected to be made with the Department of Marine and Fisheries for the issue of navigators' certificates to air pilots who desire or need them. The existing organisation under that department extends throughout Canada, and undertakes the examination and qualification of marine navigators. As the problems met with in air navigation are very similar to those which present themselves in marine navigation this arrangement is expected to be both economical and satisfactory.

7. Aircraft and Equipment. —Negotiations have been entered into looking towards the taking over by the Air Board of the seaplane stations erected during the War by the Department of the Naval Service at Halifax and Sydney, and that portion of Camp Borden which was developed as an aerodrome by the Royal Air Force and acquired by the Department of Militia and Defence after the conclusion of the War. The equipment, which will come under the control of the Air Board from these sources, has an estimated value of \$170,000. In addition to the aircraft and equipment thus acquired, 16 machines of an approximate value of \$100,000 are being received from the Air Ministry by way of replacement of those presented from time to time during the War to the Canadian forces through the activities of the Overseas Club, and the Imperial Government is also presenting to Canada aircraft and equipment of the value of about \$5,000,000, including 80 aeroplanes, 14 flying boats, 12 airships, 6 kite balloons with inflating plants and sheds, 300 motor and other vehicles and a substantial amount of armament, wireless instruments, cameras and other technical

## Notes on "Civil Aviation"

and general stores. A considerable part of this gift has already been shipped, and shipment of the remainder will not be long delayed.

### 8. Mapping

At the request of the Air Board, the Dominion Geographer has commenced the preparation of aeronautical maps on the system laid down in the Convention relating to International Air Navigation. (I.C.A.N)

The process of completing the mapping of Canada on this system will necessarily be a very long one.

### 9. Canadian Air Force

The question of the constitution of a Canadian Air Force was an early subject of consideration by the Air Board, and on December 22 there was adopted for submission to Privy Council, a memorandum covering the general lines of the organisation *proposed*.

A final decision on this subject was, however, postponed until the general policy with regard to Canada's future sea, land and air forces was determined, and it has consequently not been possible to take any further steps in this direction. *The very large number of ex-officers and airmen of the Royal Air Force in Canada are expected enthusiastically to support the proposals* if it is found possible to adopt them.

### 10. Aeronautic Intelligence.

The Air Board Act imposes upon the Board a duty "*to study the development of aeronautics in Canada and other countries.*"

In the execution of this duty *the Air Board has had the advantage of the work* done before its constitution by the Intelligence Branch of the Canadian Air Force under the Ministry of the Overseas Military Forces of Canada. *During the two years of its existence in London, the Intelligence Branch of the Canadian Air Force under the Ministry of the Overseas Military Forces of Canada collected material of very great interest and value*, and its papers were, in the course of demobilisation of the Canadian Expeditionary Force, *transferred to the Air Board*, which also secured the services of one of the officers chiefly responsible for its administration.

The Air Board, consequently, has available fairly complete sets of drawings of almost all standard British machines, engines and equipment, with specifications for the construction of many of them, *and has also an adequate collection of technical publications, reports and documents*. The Intelligence Branch of the Canadian Air Force, O.M.F.C., established communication with the chief aircraft manufacturing companies, and this communication has been maintained, with the result that the Air Board secures early information of developments in design and of inventions having an importance from an aeronautical point of view. With this material it is able to deal with the problems which present themselves to commercial and other companies, and which require solution in connection with operations undertaken on behalf of the Government. Report of the Canadian Air Board for the Fiscal Year ending March 31, 1920. The Air Board, Ottawa, Canada.

27 May 1920 : ROYAL AERONAUTICAL SOCIETY NOTICES : Examinations.

The Examinations Committee have presented a preliminary report to the Council on the qualifications for Associate Fellowship which should be accepted in lieu of the Society's own examinations. These are grouped under three heads :

- (a) General Education,
- (b) Technical Qualifications,
- (c) Aeronautical Qualifications.

In addition it is recommended that an age limit should be fixed and a certain number of years' experience in the application of science to aeronautics be required.

27 May 1920 : England : AVIATION IN PARLIAMENT : House of Commons on May 17.

MR. HOPKINS : asks the Secretary of State for War and Air

1. what are the centres at which demobilised officers and men of the Air Service can obtain at the present time instruction in aeronautical engineering ;
2. whether the facilities at the centres in question are adequate ; and
3. to what extent the Air Ministry or other Government Department is at the present time giving financial or other assistance to these centres for the specific purpose of developing instruction in aeronautical engineering ?

Mr. Churchill: The whole question of education and research in aeronautics was considered by *a Committee under the Chairmanship of Sir Richard Glazebrook*. My hon. friend can obtain a copy of *this Committee's Report dated 12 December 1919* which has been adopted by the Government and which sets forth proposals for the establishment of a school of aeronautics at the imperial college, south kensington. Instruction in the subject is also given, i understand, at East London college and at the cambridge university.

*I do not think it is possible to say at this stage whether the facilities provided will prove to be adequate.*

## Notes on "Civil Aviation"

With regard to the last part of the question, my hon. friend will find that *the Report provides for an annual expenditure of approximately £10,000 in connection with the South Kensington scheme*. This charge will be borne, during the current year, by the Department of Scientific and Industrial Research"

The RAF consists of the following branches : Administrative Branch Technical Branch Flying Branch Medical Branch Physical Training Branch Short Service Long Service and Permanent service Commissions.

Civil Service Commission of Canada : The Civil Service Commission wishes to express its gratitude to the people mentioned below who willingly, and often in a relaxed manner, made important services by forming part of the offices of examiners in a certain number of special competitions held under the authority of the Commission.

Major L. S. Breadner, Airman Examiner, Air Force Bureau.

Capt. G. O. Johnson, Superintendent of Personnel, Division of Works, Office of aviation.

Lt.-Col. Robert Leckie, Office of Aviation

Note. â € "Except when it says otherwise, the address is" Ottawa ".

28 May 1920 : Arthur K. Colley and mechanic W.C. Landrigan fly a Curtiss "JN4C" Canuck" from Leaside aerodrome, Toronto to Eastwood Parke, Hamilton carrying a special Air Mail in connection with an Athletic Carnival in Toronto. The "Grand Army of Canada" [United Veterans] print a \$1 stamp with the authorisation of the post office.

31 May 1920 : The USA signs the International Air Convention (with certain reservations) by 07 July 1920 ICAN has been signed by all the Allied and Associated Powers.

05 April 1920 : The Aeroplane : The appointment of Dr. Leonard Bairstow, C.B.E., F.R.S., to be Professor of Aerodynamics at the Imperial College of Science and Technology, was announced on April 5th.

09 May 1920 : The Aeroplane : The Canadian Air Board's official announcement of the formation of the Canadian Air Force was published on May 19th.

12 GEORGE V PARLIAMENTARY PAPER No. 29 A. 1922

## DIVISION OF COMPANIES

The number of companies incorporated under the authority of the law of Companies, and the amending laws, were 852 during the 1920-21 fiscal year (there including 25 corporations without share capital), with total capital of \$ 752,062,683.32; the number of companies in existence that have been granted supplementary letters patent was 229, of which 135 had a capital increase of \$ 79,803,000, 17 with diminished capital of \$ 7,698,300, the remaining 77 obtaining additional letters patent for purposes various to know name change, increase of powers, etc., all coming To constitute a total of 1,081 additional charters and charters issued during exercise; the total capital of the new companies and the net increase of the capital of the companies in existence, it amounted to \$ 824,267,383.32, total maximum. Attached are the usual synoptic tables (with tables of materials) providing all the details of the incorporation of all companies, as well as those of all the companies in existence to whom we have granted during the exercise of supplementary letters patent.

The total number of mortgages or charges recorded in accordance with The provisions of Section 69A of the Companies Act was 62 for the fiscal year.

The total number of companies that provided the summary required by section 106 of the Companies Act, for the fiscal year ended March 31, 1920, up to and including March 31, 1921, is 3,200; an increase of 875 on the figure from the previous year (2,325). We also received 805 reports for the March 31, 1918 and 1919, making a total of 4,005 reports received during last fiscal year.

We see that companies are increasingly complying with the requirements of section 106 of the Companies Act. However, several companies are still at fault in this respect and should comply with the law without further delay. **SYNOPTIC TABLE OF LETTERS PATENTES PROPOSED IN FAVOR OF COMPANIES (Businesses) ESTABLISHED INTO A CORPORATION UNDER THE AUTHORITY OF THE COMPANIES ACT, PART I OF CHAPTER 79, S.C., OF 1906, AND MODIFYING LAWS, FROM APRIL 1, 1920, TO MARCH 31, 1921**

PARLIAMENTARY PAPERS - VOLUME 8 - FIRST SESSION OF THE FOURTEENTH PARLIAMENT OF THE Dominion OF CANADA - SESSION 1922 - VOLUME LVIII - Dept of the Sec of State - Letters patent issued : pg 75

19 June 1920 : Ottawa Canada : Canada Gazette : Public Notice is hereby given that under the First part of Chapter 79 of the Revised Statutes of Canada, 1906, (The revised statutes of Canada, 1906, proclaimed and published under the authority of the act 3 Edward VII., chap. 61 (1903)) known as "The Companies Act" and amending Acts, Letters patent have been issued to the "CANADIAN AIR FORCE ASSOCIATION" under the Seal of the Secretary of State of Canada bearing date the 8th day of June 1920, incorporating:

the Honourable Hugh Guthrie, C.R., a Member of his majesty's Privy Council and one of His Majesty counsel (Minister of Defence);

Oliver Mowat Biggar, C.R., vice-chair of the Air Board and one of His Majesty counsel (Lawyer, second [Judge Advocate General](#) for the [Canadian Forces](#) , first Canadian co-chair of the Canada-United States [Permanent Joint Board on Defense](#). chief legal adviser and member of the Canadian delegation to the 1919 Paris Peace Treaty  
Major-General Sir Willoughby Gwatkin, K.C.M.G, C.B,  
Lieutenant-Colonel Robert Leckie, D.S.O., Superintendent of Air Operations;  
Lieutenant Colonel James Stanley Scott, CM, Superintendent of Certificates,  
Edouard Deville, L.L.D D.T.S Doctor of Laws, A.T.F., Surveyor-General  
all of Ottawa, Ont.

"CANADIAN AIR FORCE ASSOCIATION"

Incorporated on June 8, 1920. **No share capital.**

Members of the corporation.

## Notes on "Civil Aviation"

"Hon. Hugh Guthrie, C.R., Member of the Privy Council His Majesty;  
Oliver Mowat Biggar, C.R., vice-chair of the the AA © AERONAUTICS;  
Sir Willoughby Gwatkin, BCM, BC, Major-General;  
Robert Leckie, O.S.E., Lieutenant-Colonel, Superintendent of Air Operations;  
James Stanley Scott, CM, Lieutenant Colonel, Superintendent of Certificates,  
Edouard Deville, Doctor of Laws, A.T.F., Surveyor-General  
all of the City of Ottawa, in the Province of Ontario

First or interim directors : The aforementioned members.

Headquarters : Ottawa, Ont.

Object of the company : To promote the efficiency and advance the interests of the Canadian Air Force and to assume such share of the administration of such force constituted under the provisions of the Air Board Act 9-10 George V. e 11 as may be authorised by the Governor in Council.

The operations of the corporation to be carried on without share capitol throughout the Dominion of Canada and elsewhere by the name of "Canadian Air Force Association" and the chief office of the said corporation to be at the City of Ottawa, in the Province of Ontario.

Dated at the Office of the Secretary of State, 10th July 1920 - Thomas Mulvey, Under-Secretary of State.

Canada Gazette volume 53, number 51, 19 June 1920, page 35, 1920. (p. 4465)

11 June 1920 : USA : The earliest organization chart of "Langley Field Station" [NACA] appeared 11 June 1920, the day of the Langley dedication ceremonies. A draftsman prepared it with standard engineering lettering. According to the chart the senior staff engineer and the chief physicist are of equal rank.

16 June 1920 : Canadian Minister of Militia and Defence [and Acting Solicitor-General] Hugh Guthrie made a general statement on the motion for- Committee of Supply regarding the Estimates submitted by his Department and the organisation of the Militia and permanent force of Canada.: In 1913-14 the Estimates totalled \$10,917,000. The permanent force of Canada consisted of 2,906 men of all ranks. The permanent force which existed in Canada at this date consisted of exactly 3,555 men. Why should there be an increase shown in the vote if the establishment was about the same ? The reason was that the cost of maintenance to-day was just about double what it was in those years. In the year 1910-11 a private in the permanent force received 50 cents a day, after three years 60 cents, and after six years 75 cents. The pay of a private in the expeditionary force was raised to \$1.10 a day. The new pay regulations provided that a private should receive \$1.70 a day. In 1903 or 1904 Parliament authorised a permanent force to the extent of 5,000 men, but it was never recruited up to that strength. Last year the House of Commons agreed that the permanent force of Canada should be increased to 10,000. For the information of the House he would state what the whole permanent force establishment was. They had the Royal Canadian Horse Artillery stationed at Kingston, a very efficient force, which was used for the training of artillery Militia units.

That was the main purpose of the permanent force. They had only one more regular artillery branch in the Service, and that was the garrison artillery which was stationed at Halifax, Quebec, and on the Pacific Coast. In regard to infantry, they had the Royal Canadian Regiment, the Princess Patricia's Canadian Light Infantry, and a new regiment just formed for the purpose of perpetuating the heroic deeds of the men who formed the overseas regiment known as the 22nd. In cavalry they had two units, the Royal Canadian Dragoons and the Lord Strathcona Horse. In addition they had the Engineering Corps, the Army Service Corps, the Medical Corps, the Dental Corps, a corps of clerks engaged in the Pay Office and two other corps which they had not yet organised, the Signalling Corps and the Army Chaplain Corps.

He had this advantage over all his predecessors in the office of Minister of Militia in that he was surrounded by the ablest and most experienced staff of men who were ever gathered together in Canada. He had on the staff, as the House was aware, as Inspector-General, General Sir Arthur Currie, undoubtedly the greatest soldier the country had ever produced.

The permanent force was their training force ; it was their organising force.

In Ottawa they had the headquarters for Canada, and in addition they had eleven military districts throughout Canada, in each of which they maintained a small staff and a small force of the permanent corps. These were the forces that came into direct contact with the militia units. These were the men who did the actual training, gave the actual instruction, and saw to the actual administration in militia matters generally. Speaking generally, the war resulted in the complete disorganisation of the militia of Canada. A large part of the work at headquarters was to reorganise the militia and to do it as economically, fairly and expeditiously as under the circumstances it could be done.

## Notes on "Civil Aviation"

Returned Officers : They had a tremendous number of returned officers who were very capable men. Naturally they were not able to retain the services of more than a limited number of these excellent officers. In every single instance when an officer with overseas experience had applied for a position in the permanent force his case had been considered in the first instance by a board of selection composed of experienced officers, and if the name was passed by the Inspector-General and the Militia Council it was finally submitted to the Privy Council. There were 140 non-commissioned officers who had obtained commissions when serving overseas. They employed all of that class that they could, but a number of them they had retired on pension. In Great Britain if they could not employ an officer they put him on half pay. They had no system of half pay in this country out of which to provide for officers who had come back and for whom there were not enough positions in the service. Speaking of improvements, the Minister stated that they had in the Department of Militia as fine a corps of engineers as could be found anywhere in the world.

They had a great many engineering services in the Government of Canada apart altogether from the Militia Department. He believed that a system could be worked out whereby all the engineering work of the Government could be performed by engineers of the Militia Department and that the result would be a tremendous saving.

One other suggestion first and foremost among the functions of the Department was the defence of Canada.

The Inspector-General was very strong in the view that all branches of that defence should be centred in a single department ; that they should have in that department not only their permanent forces and their militia, but also their mounted police, their civil police, their Air Board. As the work became reduced, the work now done by the Department of Soldiers' Civil Re-establishment might also be brought under the Department of Militia. The Inspector-General thought that the carrying out of some such plan would result in more efficient co-ordination of work and a tremendous saving in the carrying on of these various services. These were matters which were now under consideration.

the question of the restrictions on the territorial extent of Dominion legislation has been raised in the Dominion of Canada. It has been claimed by high authorities<sup>2</sup> on the Canadian constitution that the right to legislate with extra-territorial effect must be inherent in the powers of the Dominion, since otherwise it would have no power to provide for the discipline overseas of its military forces or the regulation of its naval forces beyond the territorial waters of Canada. The first argument, however, is invalidated by the fact that the Imperial Army Act authorizes the extra-territorial application of Dominion legislation on this topic, and the second by the fact that the same purpose is aimed at as regards Dominion navies by the Imperial Naval Discipline (Dominion Naval Forces) Act, 1911. [...] The Government and Parliament of Canada have finally decided to secure the extension of the powers of the Dominion by requesting an amendment of the British North America Act so as to confer on the legislation of the Dominion extra-territorial effect to the same extent as belongs to legislation of the Imperial Parliament. One immediate ground of seeking this power was afforded by the desire of the Government to legislate regarding

aircraft registered in Canada when flying beyond the strict limits of the Dominion. The decision, however, raises a difficulty since the power of regulating the actions of British subjects beyond British territory, hitherto the sole prerogative of the Imperial Parliament, must be shared with the Dominions. To obviate conflict of jurisdiction it is clearly necessary that each Parliament should confine its authority in actual exercise to those British subjects who by birth or residence are identified with its territory. A precedent for such action exists in the case of merchant shipping, since each Dominion is now expected to regulate British shipping registered in its territory, and the immigration laws of the Dominions have recognized the right of a native of the Dominions or a settler who has effectively established there his home to re-enter his native land or adopted home without complying with the conditions exacted from other British subjects. It will, however, still be necessary for the Imperial Parliament to legislate in certain cases for all classes of British subjects, for instance as

regards the legal position of all British subjects resident in places where the Crown exercises extra-territorial jurisdiction such as China and Persia or the Ottoman territories 153 ... [...] Imperial legislation can apply to a Dominion only with the full assent of that Dominion, which normally will be expressed by a resolution of its Parliament.

The problem of Imperial legislation presents itself with special acuteness in the case of Canada, for the federal Parliament has no power to vary in essentials the constitution provided for it in the British North America Act. It is, therefore, only possible to obtain changes in the constitution when they are supported by the clear wish of the vast majority of the people of Canada as attested by addresses from either house of the Dominion Parliament, and the lack of opposition from the provincial Governments. When in 1907 important changes were made in the subsidies granted by the Dominion to the provinces, the Imperial Government consented to obtain the assent of Parliament to the alterations desired only when they secured assurances that the provinces were willing that the federal compact should thus be varied and an express admission was made that the constitution could not be changed without general assent. In 1915 very necessary changes in the representation of the various parts of the Dominion in the Senate were similarly effected by an Imperial Act after the concurrence of the Senate in the alterations had been procured by concessions made by the Government to the Opposition on matters of importance, including the postponement of the operation of the change until the next general election of the Canadian House of Commons.<sup>1</sup>

The position in Canada is therefore irksome and inconvenient ; changes in the constitution are possible only when they are noncontentious ; any serious difference of opinion would merely result in the refusal of the Imperial Parliament to legislate, and important alterations would inevitably excite sufficient opposition to secure their being left in abeyance. The situation of the Dominion thus compares very unfavourably with that of the Commonwealth, which has ample power of change of constitution, although like Canada its constitution is federal in principle. It has naturally, therefore, been a subject of consideration in the Dominion to discover a basis on which to effect agreement on a method of altering the constitution in which the aid of the Imperial Parliament need not be invoked. So far, however, the attempts made have not been successful, Quebec in particular deprecating any change in a system which assures her the fullest protection for her peculiar position in the Dominion. A curious problem is presented as to the validity of the exercise of the paramount power of Imperial legislation by the passing of the Indemnity Act, 1920, of the Imperial Parliament. That enactment forbids the institution in any court of an action for any proceedings by officers of the Crown or persons acting by their orders in certain circumstances, whether the matters concerned took place within or without His Majesty's dominions. The enactment at first sight would appear to apply to all courts in the Empire, but this interpretation is negatived by the power given in section 7 to apply the Act to any part of His Majesty's dominions except the self-governing Dominions, so that the indemnity has no application directly to matters coming before the courts of these Dominions. On the other hand, the enactment has an indirect effect ; had it not been passed an action could

---

<sup>153</sup> Keith, *Journal of Comparative Legislation*, iii, 132-4, and the Canadian Bill of 1920 denning Canadian nationals for League of Nations purposes.

## Notes on "Civil Aviation"

have been brought in England in respect of an illegal act done in one of the self-governing Dominions, unless an Act of Indemnity applicable to the action in question had been passed in the Dominion. But, though the Act does not attempt to interfere with the jurisdiction of Dominion courts, it expressly forbids the British courts to treat as illegal an action done in a Dominion, even if the action is not validated by legislation in that Dominion.

In Canada and in New Zealand the same argument was adduced ; the power to legislate, as conferred by the Imperial Acts constituting the constitutions of the two Dominions, gave them authority only to legislate for the peace, order, and good government of the Dominions ; how, therefore, could they legislate to send troops overseas, and therefore beyond the limits of the Dominion ?

During the war, the organization of a Canadian Naval Air Service was undertaken. [The Imperial Act of 1911 not having been applied to Canada, the validity of its legislation beyond territorial waters was doubtful, and application is accordingly now made for extended powers in this regard (cf. Acland, Journal of Society of Comparative Legislation, xviii. 15-25). In the meantime *an Act of 1918 has rendered the Imperial Act of 1911 applicable to Canada*, and it has so been applied by an Order in Council of June 20, 1920]

09 July 1920 : Ottawa, Ontario : With a civilian force at present hard at work, preparations for the opening of Camp Borden as the chief training centre of the air force are going on apace.

*When completed Camp Borden will be the main Stores depot and repair shop of the air board of Canada, and the camp also will be the chief training centre.*

The camp, which cost \$1,500,000 to build several years ago, contains 121 principal buildings, eighteen of the hangars are completed, and there are also ready workshops and offices and men's quarters. The main aerodrome covers a space one by one and a half miles.

There are at the camp over 100 of the latest type English land machines, and also a considerable number of "boats" with a complete outfit of Instruments and equipment for photography, wireless and gunnery work.

Seventy-five per cent of the machines and equipment given by the British Government to Canada are new on the ground. Officers state that at present prices the gift would cost between five and six million dollars, while at replacement prices the cost would be increased by at least fifty per cent, and some of the material could hardly be secured anywhere. Training is expected to begin in three weeks.

Source ref : Times Columnist : Victoria BC Canada 10 July 1920

09 July 1920 : VANCOUVER, BC : Major F. G. Pinder, of the military branch of the Air Board of Canada, with headquarters at Ottawa, arrived in the city this morning, from the east. He was accompanied by *Major Ker, of Victoria, who returned from Winnipeg, where he attended the conference of the Canadian Air Force Association officials last week.*

While in British Columbia Major Pinder will meet the executive of the British Columbia branch of the C.A.F.A. to formulate plans for the operation of the air militia in this province. Immediate attention is to be paid to arranging for courses of instruction of militia pilots at Camp Borden. He points out that only 8.7 per cent of the pilots enlisted in the C.A. F., at present come from British Columbia, and a strong effort is to be made to bring the numbers up to the proportion of other provinces before the end of July. Tomorrow he will interview the Lieutenant-Governor, chairman of the British Columbia branch of the association.

Source ref : Times Columnist : Victoria BC Canada 10 July 1920

July 1920 - Olympia Aero Show - exhibited :

6 cyl. Siddeley "Puma" Watercooled 250 h.p. (the Standard 6 cyl. of the Royal Air Force).

12 cyl. Siddeley "Tiger" Watercooled 500 h.p.

2 cyl. Armstrong Siddeley Twin Aircooled 45 h.p.

7 cyl. Armstrong Siddeley Radial Aircooled 150 h.p.

14 cyl. Armstrong Siddeley Radial Aircooled 300 h.p

The Air Ministry's Part.

Having thus unburdened one's soul concerning the aeroplane constructors, one desires to refer once more to the Air Ministry exhibits. No visitor to the Show should leave it without making a tour of the galleries. There one finds the difference between the Air Ministry of to-day and the Bolo House of the war. All the Bolos have been cleared out and to-day we are blessed with a number—unfortunately only a small number—of keen and capable practical men who are working strenuously for the progress of aviation.

It was only a fortnight before the Show that the Air Ministry was asked to co-operate in making the affair a success. It has responded nobly. Air Vice-Marshal Ellington's whole Department of Supply and Research has surpassed itself. The once-execrated Aeronautical Inspection Department, under the personal direction of Wmqr-Comrhpnnder Bagnall-Wilde and his chief accomplices Wing Commander Outram and Flt. Lieut. Mansellj have arranged a most convincing show 01 the methods by which the officials of the Department test, check, measure, gauge, and otherwise manipulate aircraft and aircraft components so as to ensure their being fit not only to use without danger to pilots and passengers, and the Great British Public on the ground, but to uphold the reputation of British manufactured products all over the world.

Similarly, the Department of Research, under Air Commodore Brooke-Popham, has laid itself out to demonstrate how it sets about testing and developing new ideas which are submitted to it or which it evolves from its own inner consciousness. In this section the Royal Aircraft Establishment, under Mr. Sydney Smith, once so ill-beloved as the Royal Aircraft Factory and now one of the greatest helps to the Aircraft Industry, contributes a number of most interesting examples of its work.

It would require several issues of this paper to describe adequately all the tricks and dodges and gadgets and bits and pieces displayed by these Departments. With paper ar<d printing at its present prices one cannot even think about describing these exhibits. One can only advise everybody to go and see for themselves how well the progress of British aircraft design and construction is helped "by the Air Ministry as at present constituted, and how well the reputation of British aircraft is safeguarded.

Truly, the technical side of the Air Ministry deserves a special vote of thanks from all concerned with British aviation for the way in which it is advertising at Olympia the excellence of our British Aircraft. Probably in this instance virtue is its own, and only, rewad. Those concerned with these exhibits must be feeling uncomfortably virtuous, and so one is promising oneself the pleasure, when the next Show-Report Issue of this paper—dealing with the engines and components—has been safely compiled, of spending a happy day in the Gallery of Olympia basking in this atmosphere of virtue and, so to speak, sitting at the feet of the Gamaliels of the Technical Departments.

## Notes on "Civil Aviation"

One believes that, reckoning the training establishments only, each war pilot cost about 10,000 pounds to produce, including his crashes in training and omitting his active service crashes. The Aeroplane July 14, 1920 pg 86

### THE WRIGHT PATENTS AND AN INJUNCTION.

In the New York Law Courts on July 10th, Federal Judge Thomas Chatfield granted a perpetual injunction against the sale or use in the United States of America of any foreign-built machines embodying features which are an infringement of the Wright patents. The injunction was granted to the Wright Aeronautical Corporation of Paterson, New Jersey, in a suit against the Inter-Allied Corporation of New York—an offshoot of Handley Page, Ltd.

- A similar action is to be opened against the Aerial Transport Corporation of Delaware, a company formed recently to supply surplus British aircraft in an aerial service between Chicago and New York. This injunction would appear to be effective against all aircraft the maintenance of lateral stability in which is by means of warping wings or any form of horizontal ailerons.

### SIX MONTHS OF CIVIL AVIATION-II.

The Dominions, India, and the Colonies.

Arrangements are being made to secure "the greatest possible measure of uniformity" between Air Regulations of each unit of the Empire. The "Air Navigation Bill provides for the adaptation by Order in Council to British Possessions, exclusive of the self-governing Dominions and India, of the legislation in force in this country." India and Canada have formed Air Boards and have published Air Regulations.

The Colonial Office, the India Office, and the Foreign Office (for Egypt) are working with the Air Ministry to effect interchanges of opinion between the Dominions and Colonies and Great Britain.

In Australia an "Air Services Committee" deals with aviation questions. The administration of Civil Aviation is now under consideration. A gift of one hundred aeroplanes has been accepted from the British Government. The Canadian Air Board Act was passed in January, 1919, of from five to seven members appointed by the Governor in Council. The duties of the Board resemble those of the Air Council in Great Britain. A Superintendent of Flying Operations, with a seat on the Board, "controls the licensing of personnel, aircraft, and air harbours, and is responsible for Civil Aviation conducted by private enterprise."

An Associate Air Research Committee, formed under the Honorary Advisory Council for Scientific and Industrial Research, began its sittings on Feb. 7th, and is in close cooperation with the Board. Dangerous flying was prohibited by Order in Council on July 7th, and Civil Aviation Regulations were issued on Jan. 17th last. Experiments in photo-topographical surveying have been authorised in the Province of Quebec.

Licences. to March 31st, 1920.

During the past six months under review the following licences and certificates have been granted in the empire:

Licences for ground engineers 113 ..Total issued since May 1st, 1919 = 345

Licences for engineers 1 Total issued since May 1st, 1919 = 1

09 September 1920 : IT is hereby notified [Flight 09 Sept 1920] :

In accordance with the provisions of the Air Navigation Regulations, 1919, Schedule 5, "Standard Log Books" have now been prepared for use by firms, pilots and others engaged in civil flying and are available at the prices shown :—  
Pilot's Log Book. C.A. Form 24. Price 2s.

## Notes on "Civil Aviation"

Journey Log Book. C.A. Form 26. Price 4s.

Aircraft Log Book. C.A. Form 27. Price 3s. 6d.

Engine Log Book. C.A. Form 28. Price 3s. 6d.

The books are obtainable through any bookseller or direct from H.M. Stationery Office, Imperial House, Kingsway, London, W.C.2, or their agents. N.B.—This Notice cancels Air Ministry Communique No. 381 of November 14, 1919, which authorised temporarily the use of R.A.F. type Log Books. (Notice to Airmen, No. 92.)

Air Ministry, C.A. Form 61 - medical form.

28 July 1920 : UK - Aeronautical Engineering - supplement to The Aeroplane, pg 260 : The Canadian Liaison Officer in London, Major D. R. McClaren, D.S.O., Canadian Air Board, Air Ministry, Kingsway, W.C.2.

11 August 1920 : "The Aeroplane Vol XIX No. 6 : cover : ON AIRWORTHINESS : The Benefits of Accidents.

When the Marquess of Londonderry, our very excellent Under-Secretary of State for Air, introduced the new Bill in the House of Lords on May nth, he put the case with his usual brevity and lucidity.

He said : "The first essential is to have some proper authority to find out exactly the cause of each accident, so far as it is discoverable, with a view to obtaining the same degree of safety as is possessed by railway administration to-day.

A second reason is that comparative safety is essential to the development of civil aviation as a recognised method of public transport of passengers.

"There have been 28 civil accidents between May 1st, 1919, and March 31st last, and the experience gained in investigating them has been of great value. It is, however, essential, from the fact that aircraft usually crash in private property, to have right of access to such property, to investigate the debris, and to prevent the machine being removed pending the inquiry. It is considered necessary to take power to hold a formal investigation of the same kind as is conferred on the Board of Trade under the Regulation of Railways Act, 1871."

### **A Powerless Power in the Land.**

Many people are under the impression that the Air Ministry has absolute power over the doings of all aviators and over all who own or operate aircraft. As a matter of fact the Air Ministry has very little power of any sort until the new Bill becomes law. The Air Ministry certainly has the power to grant licences to aviators and to grant airworthiness certificates to aeroplanes, but, so far as one can discover, the Air Ministry as such has no power to prosecute an unlicensed pilot for flying an uncertified machine.

Nor has it actual power to investigate accidents—as Lord Londonderry's speech shows.

It is true that the local police can prosecute if they think fit. For example, they prosecuted a pilot at Fenny (or Stoney) Stratford who was taking up passengers "for fee or reward" without a licence while on his way to Coventry. But the Air Ministry itself could not, one believes, have instituted the prosecution.

Furthermore, it appears that when once a pilot has been licensed his licence cannot be withdrawn or cancelled or endorsed. The worst that can happen to him when once he has got his licence is that he may be turned down by the medical people when he comes up for his six-monthly inspection.

Also, when once a machine has been passed as airworthy its certificate cannot be withdrawn, and it can be used in a thoroughly unfit state so long as a "licensed ground engineer," who is as often as not an employee of the owner or operator of the machine, can be induced to sign for its airworthiness day by day.

If anybody is killed, or seriously damaged, by the carelessness or incompetence of the pilot, or through the unfitness of the machine, then the Common or Criminal Law of the Land applies.

But the Air Ministry itself cannot prevent accidents by forbidding the pilot to fly or forbidding the use of the machine when once certificates or licences have been issued.

### **The New Power in the Air.**

Therefore is it eminently satisfactory to find the following section in the new Bill:

## Notes on "Civil Aviation"

Sect 12.

(1) The Secretary of State may make regulations providing for the investigation of any accident arising out of or in the course of air navigation and occurring in or over the British Islands or the territorial waters adjacent thereto, or to British aircraft elsewhere.

(2) Without prejudice to the generality of the foregoing provision regulations under this section may contain provisions:

(a) Requiring notice to be given of any such accident as aforesaid in such manner and by such persons as may be specified in the order.

(b) Applying, with or without modification, for the purpose of investigations held with respect to any such accidents any of the provisions of section three of the Notice of Accidents Act, 1894; (57 & 58 Vict. c. 28).

(c) Prohibiting, pending investigation, access to or interference with aircraft to which an accident has occurred, and authorising any person, so far as may be necessary for the purpose of investigation, to have access to, examine, remove, take measures for the preservation of, or otherwise deal with any such aircraft.

(d) Authorising or requiring the cancellation, suspension, endorsement, or surrender of any licence or certificate granted under this Act, or any order made thereunder where it appears on an investigation that the licence ought to be cancelled, suspended, endorsed, or surrendered, and for the production of any such licence for the purpose of being so dealt with

(3) If any person contravenes or fails to comply with any regulations under this section, he shall be liable on summary conviction to a fine not exceeding fifty pounds or to imprisonment with or without hard labour for a term not exceeding three months.

What is an Owner?

It is also to be noted that in the Bill the word "owner" includes "any person to whom the aircraft is demised" or "any person to whom the aircraft is hired at the time of the offence." That is to say, either the pilot or the hirer may be held responsible for an accident or trespass if the machine is out of the hands of the real owner at the time. And, finally, The new Bill gives the Air Ministry the actual power necessary to institute proceedings against those who break the Law of the Air. All of which is very much to the good, and will not only make flying much safer in the future, but will enhance still further the reputation of British aircraft abroad.

### The Need for Stringency.

---

There is no doubt that the whole system of checking the airworthiness of aeroplanes needs tightening all round. This is certainly not due to any lack of keenness or energy on the part of *General Bagnall-Wild or his Aeronautical Inspection Department*, but simply because under the old Act that Department has not the power to make its work as effective as is desirable.

It can refuse an airworthiness certificate when application is made for a new certificate, but it cannot withdraw that certificate when once granted. Also, one believes that it has not as yet the power to insist on such detailed inspection as may seem desirable in some cases of machines which have been in use for a considerable time.

Desirable Publicity.

For example, it should be made clear that the machine was not by any means new.

Also the *date of inspection for its airworthiness certificate by the A.I.D. should be published.*

And *the public should be told whether that inspection included the opening up of the wings and fuselage so that the state of the internal structure could be investigated.*

Furthermore, *the position and technical qualifications of the individuals who vouched for its airworthiness day by day should be stated.*

So much publicity at least is desirable from all points of view. The owner or owners of the machine would, one feels sure, be glad of a public statement to make it clear that they were not to blame. The Avro Co. would certainly wish to have it known that they were not in any way concerned. The makers of the machine, whether now in the Aircraft Industry or not, would be equally glad of full publicity. The A.I.D. would also, one feels sure, like to have it known that they did all that lay in their power to assure its airworthiness.

Enabling Bill.

As may have been gathered, the new Bill concerns exclusively the Department of Civil Aviation. Sir Frederick Sykes, Controller-General of that Department, has laboured strenuously for the good of Civil Aviation ever since hostilities ended, and under the most difficult circumstances. He has had, so to speak, position without

## Notes on "Civil Aviation"

power, an office without officials. He has had to work with words rather than deeds. And yet Jie has done much to establish this undeserving country as the leader of the world in Civil Aviation.

Sir Hugh Trenchard has made the R.A.F. the leading militant power in the air.

One hopes that the new powers conferred on the Air Ministry by this enabling Bill will enable Sir Frederick to place British Civil Aviation in as dominant a position as that occupied by the R.A.F. Then we shall indeed be able to claim the Command of the Air. - C.G. Grey.

### THE AIR MINISTRY EXHIBITS AT OLYMPIA

Of the exhibits which filled the gallery at Olympia, all of them contributed by the Air Ministry, that staged by the Aeronautical Inspection Department illustrative of the tests and measurements made during the process of manufacture of both aeroplanes and aero engines was extremely interesting and instructive.

The first exhibit in this section, actually a contribution from the R.A.E., showed the skeleton of a Sopwith "Camel" inverted upon trestles and with its wings loaded for a strength test.

This is shown in a photograph which illustrates the method of support of the fuselage and the method of loading with quilted bags of lead shot of standardised weight.

The next exhibit showed the measurements made to ensure accuracy of trueing up. In this case the machine was a Bristol "Fighter," blocked up to the trueing-up position, and equipped with plumb bobs, incidence gauges, and the like instruments, and with tapes illustrative of the numerous measurements which compose the routine of erection checking. After these familiar sights there were to be discovered numberless special instruments, gauges and jigs devised for the securing of accuracy in the manufacture of the components of aeroplanes, aero engines and airscrews.

Of the importance and the volume of this checking work in the late war one may judge by the presence among the A.I.D. exhibits of two balances expressly designed for checking the weights and the balance of the cylinders of rotary engines and of the connecting rods of engines generally.

It is fairly obvious that such measurements could be carried out on small quantities of parts by the use of normal weighing appliances of adequate sensitivity. That it should have been worth while to devise and build the complex instruments exhibited shows how great an amount of this work must have been necessary and how thoroughly it was carried out.

Many of the gauges devised for checking the dimensions of engine parts were extremely ingenious. One in particular was designed to secure that an internal and an external key-way in one particular engine component were accurately set at their intended angle one to another.

This gauge consisted of two blocks of steel, each one half of the same cube. Each half was bored to be a snug fit on one end of the component in question. One half in addition was bored right through and into this orifice was fitted a keyed plug which projected into the component and engaged in the internal keyway.

The other half possessed a slot, in section similar to the plan form of the external keyway, through which there passed a long fitted plug to engage in this keyway. With the plug in place and entering the external keyway, provided that the two keyways are properly located, the two halves of the gauge

formed a perfect cube. Any error in location resulted in the two halves of the cube being twisted relatively one to another, and a very small error could be detected by touch at the joint between the two.

If the location were correct the joint could not be felt, but the least twist resulted in a slight break in the surface and the projection of a sharp edge.

Extremely interesting also were certain sectioned blocks of cylinders showing the "innards" of an actual engine in their working positions.

Photographs of two of these—a Hispano-Suiza block of four cylinders, and a Siddeley "Tiger" block of three, are reproduced. These two engines show certain features in common. The cylinder block castings of both are of aluminium, with steel cylinder liners. In the Hispano-Suiza the liner is supported over its whole working length by the aluminium casting into which it is screwed, and the cooling water is in contact with the aluminium alone.

It is known that owing to the different expansion coefficients of the steel liner and the aluminium casting complete contact can only occur at some one temperature, and the sectioned cylinder clearly showed that this temperature was not that of Olympia. It can be seen in one of the photographs of the "Tiger" block that in this case the steel cylinder is screwed only into the head casting, and the aluminium block casting which is bolted thereto forms only the outer wall of the jacket. There is therefore no possibility of an air space intervening between the barrel and the cooling water. In the Hispano-Suiza engine the cams operate directly upon the tabular valve stem heads, and the valve stem is large in diameter to give ample bearing surface to take the side thrust of the cam, and hollow to reduce weight.

In the Siddeley engine the same features are found in the two inlet valves, but since it would be impossible to fit three valves per cylinder, all directly under the centre line of a common camshaft, the exhaust valve is operated through a rocker arm.

Both these examples show the extremely complicated nature of the castings which modern aero engines call for, and give some idea of the difficulties which beset the inspector called upon to determine whether such a casting is correct or not. A further very interesting section was that devoted to airscrews. Here airscrews in all stages, from the rough laminations, through the glued up, the carved, the filled, fabric tipped and polished stages to the final test to bursting on a spinning tower could be seen.

Further, instruments for checking blade shapes and angles, and for testing balance were to be found, together with, samples of all the more common defects to which airscrews are liable.

The application of X-rays to the detection of flaws in the interior of either materials or of finished parts was shown by a number of radiographs. One of these showed the interior economy of a certain box rib, and revealed the fact that a wooden packing block supposed to fit tightly between top and bottom laths of the rib actually failed to touch either with more than line contact, and also that certain tacks had split the wood whereinto they were driven. It would have been impossible to determine otherwise whether or not the block

existed at all, let alone whether it fitted properly, after the rib had been built, and it seems highly probable that in the future this method of peering into the interior of such parts to detect such cases of dishonest work may assume a great importance.

Of instruments for testing and examining materials there were large numbers, practically all of them already known to general engineering practice, but evidencing by their number and variety the very wide range of material which goes to the making of the modern aeroplane. Among the miscellaneous exhibits in this section was one very interesting type of all-steel wing, designed and built by the R.A.I.S. at Farnborough. The photograph gives a very good idea of the form thereof.

The spars are steel boxes, formed out of corrugated strip of thin gauge in what has now become practically a standard method. The rib structure is particularly interesting. It will be seen that the ribs are steel tube girders with wire cross bracing. From the point of view of economy in weight this is probably the best solution of the metal rib yet devised, but it seems highly improbable that, in such small sizes as this (the example is designed for a standard .504 K type Avro) such a structure can be produced at a reasonable cost. One irrepressible humourist described the exhibit as the "R.A.E.'s imitation of God making flies."

At the same time it must be remembered that experimental work is much better commenced on a modest scale, and that demonstration that a satisfactory wing of the type is possible in small sizes is an essential preliminary to embarking on the design of much larger wings, and that for deep wings of great chord this form of rib will probably be fairly cheap to construct.

^

Another product of the R.A.E. was the "Fireproof" Avro.

This was the fuselage of an Avro, fitted with an A. B.C. "Wasp" engine, wherein all possible precautions against the spread of fire from the engine, via the carburettor back into the fuselage fuselage and so to the tanks, had been embodied. In the scheme adopted there was nothing of startling novelty, but in the thoroughness with which the scheme was carried out there were many object lessons to the designer of engine installations.

A very complete range of instruments for both the purposes of straightforward navigation and for test flying were on view.

Of these one of the most interesting, and certainly one of the most simple, was the R.A.R. turn indicator. This depends for its operation on the well-known fact that if a spinning gyroscope is forced to change the direction of its axis of rotation in any one direction it immediately attempts to also change the direction of that axis in a plane at right angles to the enforced movement.

The turn indicator is a small diameter flywheel, carried in bearings on a trunnion. The axis of the wheel is set parallel to the line of flight, and the trunnion carrying the bearing is free to turn against a spring round an axis athwart the machine. If the machine turn, and the flywheel with it, the evroscope forces the trunnion to turn in its turn and so rotates an indicating needle on the instrument board. Rotation of the gyroscope is attained by cutting inclined holes through the wheel itself and exposing it freely to the wind, and the whole mechanism is of the simplest possible.

## THE INSTITUTE OF AERONAUTICAL ENGINEERS.

---

### July Notices.

Council Meeting.—A meeting of the Council was held on July 12th.

### Elections.—

Honorary Members : Com. Dr. Ginamni ; Col. Milivoye Yoksimovitch.

Member : Charles Baxter, M.I.Mar.E., F.R.Met. S.

Associate Members : Hector Sleemau ; Captain Charles Frobisher, F.R.Met.S. ; F. A. Thomas, A.I.E.I.Mech.E.; Major F. C. Buck; Capt. P. C. C. Passman; Gysbertus Spit.

**Foreign, Colonial and Provincial Branches.** —The Council has appointed a Branches Committee to deal with matters relating to the promotion of branches at home and abroad.

### Employment. —

Every possible assistance is being given to members in finding berths, and members desirous of availing themselves of this should communicate with the Secretary without delay.

### October Examinations.—

Associates and Students who desire to sit for the Intermediate Examination for Associate Membership must make application before August 31st, to the Secretary, from whom copies of the rules of examination are obtainable.

*Pilots may also sit for the Intermediate, and the Final Examination*, qualifying for Membership, will also be held in October.

### Financial Year.—

The Council has decided that the first financial year shall be considered to end on December 31st, shortly after which date their annual report and balance sheet will be presented.

### Monthly Notices.—

Members of the Institute who happen to "be regular readers of the journal in which these notices appear are requested to notify the Secretary accordingly, so that the unnecessary expense of sending out duplicate copies by post may be avoided in future.

### Donations.

The Council gratefully acknowledge the further gift of office furniture from the Nieuport and General Aircraft Co., Ltd., and the gift of a complete set of numbers of *Flight*, commencing with the first issue, from Frederick R. Simms, Esq. 60, Chancery Lane, W.C.2

Douglas Shaw, Secretary.

11 August 1920 : HOUSE OF COMMONS : Q&A - Aug. 11th.—The following written answers were given : —

ROYAL AIR FORCE—AEROPLANES, AIR STATIONS, AND PERSONNEL.

Mr. PURCHASE asked the Secretary of State for Air. the number of aeroplanes that are now being utilised, the number of air stations in England and Wales; and the staffs employed there.

Mr CHURCHILL : The total number of machines being utilised is 5,174. This number makes provision for initial equipment, reserve and wastage. There are 45 air stations, including depots and seaplane stations, in England and Wales, and the personnel employed total 1,389 officers and 16,750 other ranks. : The Aeroplane, pg 394 - 18 August 1920

25 August 1920 : pg 428 : The Aeroplane August 25, 1920 AIR FORCE.  
Official Communiques.

## PURCHASE OF DISCHARGE FROM THE ROYAL AIR FORCE.

---

The Air Ministry announced on Aug 19th .

The following rates have been established as those which shall be paid by airmen who are permitted to purchase their discharge from the Royal Air Force :

## Notes on "Civil Aviation"

- (i) Recruits (airmen or boys) with less than three months' service—£20
- (ii) Boys and airmen entered ; ^ boys, who have been or are being trained in the Royal Air Force for a trade in Group I or for a trade in Group II the equivalent of which in civil life would \_ have involved the serving of an apprenticeship —,£100.
- (iii) Boys, and airmen entered as boys, who have been trained or are being trained in the Royal Air Force in a trade in Group II the equivalent of which in civil life would not have involved an apprenticeship — £ ^ 0.
- (iv) Airmen entered as semi-skilled men whose training was continued in the Air Force in any of the trades in either Group I or II- £60
- (v) Airmen (including boys) entered and trained in the Navy, Army or Air Force and subsequently placed in Group A, B, C or D of the R.A.F. Medical Service— ^ 60
- (vi) All other airmen, and airmen serving in Class "E" of the Royal Air Force Reserve —£35.

### The trades in Group II which in civil life would involve an apprenticeship are shown below :

Balloon Basket Maker, Electrician, Machinist, Carpenter, Coach painter, Sheet-Metal Worker, Tinsmith.

The above amounts may be reduced in certain circumstances by authority of the Air Council, provided that such reduction does not exceed 50 per cent, of the total sum payable.

### Applications by Relatives:-

Applications by parents or guardians in respect of boys should be made by letter, giving the fullest possible particulars of the circumstances in which the application is made, addressed to • The Secretary, Air Ministry, Kings-way, London, W.C.2.

Applications submitted by boys on their own behalf will not be considered.

Applications by relatives of serving airmen should be made by letter, giving the fullest information of the circumstances in which the application is made, addressed to the officer commanding the unit in which the airman is serving.

Applications by Reservists—Applications from airmen who are serving in the Reserve should be submitted to the Officer i/c Records, Royal Air Force, Blandford, Dorset.

## " WAKEFIELD " SCHOLARSHIPS FOR R.A.F. CADETS.

---

The Air Ministry announced on Aug. 19th : —

Sir Charles Wakefield has generously undertaken to provide funds during the next three years for the award of two scholarships annually, each of a value of .-£75 per annum, which will be tenable at the R.A.F. Cadet College, Cranwell.

This offer, which has been made in order to assist cadets whose parents or guardians are in reduced circumstances, have been gratefully accepted by the Air Council'. The Scholarships will be known as "Wakefield Scholarships."

One scholarship will be offered for competition each year at the examination for admission to the College held in June and one at that held in November. The fir ^ t award will be made in connection with the examination held in November, 192c

The scholarship on each occasion will be awarded to the candidate from amongst those considered eligible by the Air Council who passes highest in the examination. In determining who is eligible the Air Council will give preference to those candidates whose l educed circumstances are due to the late War.

A King's Cadet, a Prize Cadet or a candidate nominated by the Air Council under the Regulations will ifot be considered eligible to hold a "Wakefield" Scholarship.

The Scholarships, which will be tenable for two years, will be paid in advance in equal instalments at the beginning of each of the four terms of residence.

The names of intending candidates should be forwarded to the Secretary (S.7), Air Ministry, Kiugsway, London, W.C.2, from whom any further information required may be obtained. Applications should be received not later than January and May in the case of candidates who propose sitting for the examinations held respectively in the following June and November. Applications should be accompanied by a full statement (which will be treated as strictly confidential) of the circumstances of the candidate's case.

In view of the imminence of the forthcoming examination in November, 19:1, applications to ccmplete for the Scholarship -will be accepted on this occasion only, provided that they reach the Air Ministry not later than Oct. zst, 1920.

Applications to compete for a Scholarship should be sent 'orward independently of the ordinary application for admission to the examination for the purpose of entry to the Royal Air Force Cadet College.

These latter applications should continue to be addressed to the Secretary, Civil Service Commission, Burlington Gardens, London, W.i, and should be forwarded in the manner prescribed and\_ not later than the dates erven in th- *announcement issued by the Civil Service Commissioners* in advance of each examination.

## Notes on "Civil Aviation"

26 August 1920 : H.M.A. R.32 left Flowden at 20.30 on a twenty-four hours' instructional flight. After flying over the East Coast, London was reached at 09.00 the following morning. The airship then returned to her base. The vessel carried the United States crew of the airship R.38.

04 September 1920 : Civil Service Commission : Canada Gazette pg 876 : volume 54, number 10, 4 September 1920, page 28

Civil Service Commission of Canada - POSITIONS VACANT.

Civil Service of Canada - Competition List No. 54 .

The Civil Service Commission of Canada hereby give public notice that applications will be received from persons qualified to fill the following positions in the Civil Service of Canada <sup>154</sup> : -

### **DIRECTOR, TECHNICAL, AIR BOARD (TECHNICAL DIRECTOR)**

Competition # 1438.

A Director, for the Technical Branch , Air Board, at Ottawa, at an initial salary of \$4,1100 per annum, which will be increased upon recommendation for efficient service at the rate of \$300 per annum until a maximum of \$5,100 has been reached .

This initial salary will be supplemented by whatever bonus may be provided by law .

Duties:-

Under direction, to be responsible for the technical work of the Air Board, including:-

1. the operation of the Civil Aircraft and Engine Repair sections,
2. the administration of the technical staff,
3. the designing of shipways, cradles, hangars, petrol tanks and other fixed equipment,
4. the examination and approval of aircraft required to be examined for air worthiness,
5. the approval of modifications in standard types of aircraft and equipment ;
6. the calculation of the strength of materials used in an aircraft manufactures, and
7. the making of recommendations with respect to types of aircraft and equipment proposed to be purchased ; and
8. to perform other related work as required .

Qualifications .-

1. Education equivalent to graduation in engineering from it school of applied science of recognised standing ;
2. 5 years of experience in the design and inspection of aircraft ;
3. it thorough knowledge of standard types of aircraft
4. A high degree of organising and administrative ability.

Examination(Subjects and Weights) as follows :

1. Education, Training and Experience, 4
2. Oral Interview, if necessary in the opinion of the Commission, 1.

### **SUPERINTENDENT AIRCRAFT REPAIR SECTION**

Competition # 1441

A Superintendent for the Aircraft Repair Section <sup>155</sup>, Air Board, at Camp Borden at an initial salary of \$2940 per annum, which will be increased upon recommendation for efficient service at the rate of \$180 per annum until it maximum of \$3,300 Into been reached .

This initial salary will be supplemented by whatever bonus may be provided by law .

---

<sup>154</sup> Canada Gazette volume 54, number 10, 4 September 1920, page 28

<sup>155</sup> Canada Gazette : List # 15 advertised in volume 53, number 30, 24 January 1920, page 34, position remained vacant after list 54 olume 54, number 23, 4 December 1920, page 46 and was re-advertised in List # 63 advertised in volume 54, number 16, 16 October 1920, page 10 position remained vacant after list 63 volume 54, number 23, 4 December 1920, page 46. and was re-advertised in List # 71 advertised in volume 54, number 23, 4 December 1920, page 46.

## Notes on "Civil Aviation"

### Duties:-

#### Under direction to

1. lay out and direct the work of overhauling, repairing, assembling and erecting aeroplanes, seaplanes, and flying boats and
2. to direct the work of making aircraft parts from plans and specifications ;
3. to supervise the work of an aircraft repair section whether employed upon construction or repair work ; and
4. to perform other related work as required

### Qualifications:-

1. Education equivalent to high school graduation ;
2. at least ten years of experience as a carpenter or similar woodworking tradesman ;
3. five years of which shall have been in a supervisory capacity ;
4. extended experience in the construction, rigging, and repair of aircraft
5. : ability to handle men .

### Examination (Subjects and Weights) as follows :

1. Education, Training and Experience, 4
2. Oral Interview, if necessary in the opinion of the Commission, 1.

## **SUPERINTENDENT - ENGINE REPAIR SECTION**

### Competition # 1440.

A Superintendent for the Engine Repair Section. Air Board, at Camp Borden on initial salary of \$2940 Per annum, which will be increased upon recommendation for efficient service at the rate of \$180 per annum, until a maximum of \$3,300 has been reached .

This initial salary will be supplemented by whatever bonus may be provided by law .

### Duties:-

#### Under direction to lay out and direct the work of:-

1. Erecting , testing, overhauling, dismantling and rewiring aircraft engines ;
2. to supervise the installation of aircraft engines in machines and
3. oversee such ground tests as are required :
4. to report upon the condition of aircraft engines of standard or new types ; and
5. to perform other related work as required.

### Qualifications:-

1. Education : Graduation in Mechanical Engineering from a school of applied science of recognised standing
2. at least six (6) years of experience in engineering and machine shop work, 2 years of which shall have been in the supervisory capacity.
3. Thorough knowledge of the standard types of aircraft and the organisation and management of an engine repair section
4. Thorough knowledge of metal working including moulding, brazing, silver soldering and electric welding.
5. Ability to handle men

### Examination (Subjects and Weights) as follows :

1. Education, Training and Experience, 4
2. Oral Interview, if necessary in the opinion of the Commission, 1.

## **SENIOR CIVIL SERVICE EXAMINERS**

### Competition # 1441,

Senior Civil Service Examiners at an initial salary of \$1800 per annum which will be increased upon recommendation for efficient service at the rate of \$120 per annum until it maximum of \$2160 has been reached .

This initial salary will be supplemented by whatever bonus may be provided by law.

### Duties:-

#### Under direction to perform work as assigned in

## Notes on "Civil Aviation"

1. the preparation of questions for civil service examinations,
2. the rating of papers,
3. the working out of standards for rating papers,
4. the holding of tests.
5. the advertising of examinations
6. in some cases to direct the work of Junior Civil Service Examiners ;
7. to assist in securing boards of examiners and
8. to perform other related work its required.

### Qualifications.-

1. Education : Equivalent to Graduation from a University of recognised standing
2. Two years of experience in Civil Service examination work in the department of a commercial concern, or in the work of equivalent character and standing
3. Preferably considerable knowledge in the organisation and function of government departments
4. in some cases supervisory ability
5. Tact and good judgement
6. integrity

While a definite age limit has not been set for this competition, age may be determining factor when making selection

### Examination : Subjects and Weights as follows :

1. Education and Experience, 4
2. Practical Questions 3
3. Oral interview 3
4. The second part of the examination will be given only to those who have shown that they possess the minimum qualifications in education and experience

Those successful in the first two parts of the examination will be assembled later at one or more points for oral interview

List of eligibles will be established for vacancies in the above class, but only two vacancies exist at present

### General Directions:

1. Selections for eligible lists of applicants qualified to fill similar vacancies which may occur in future may be made from the applications for those positions.
2. According to law, preference is given to persons who have been on active service overseas on the military or naval forces of His Majesty or any of the Allies of His Majesty during the late war.
3. The Age Limit does not apply to persons who have seen active service overseas, but these candidates must furnish a certified copy of their discharge certificates, or in the case of commissioned officers, a certified statement of their military services
4. Application forms, properly filled in, must be filed in the office of the Civil Service- Service Commission, in the case of competitions 1439 and 1440 not later than September 24, 1920 and in the case of competitions 1438 and 1441 not later than October 4, 1920
5. Application forms may be obtained from the office of the employment service of Canada or from the Secretary of the Civil Service Commission, Ottawa.

By Order of the Commission,  
W. Foran - Secretary  
Ottawa, September 2, 1920

15 September 1920 : The Department of Civil Aviation has begun the publication of a series of notices to civilian ground engineers.

## Notes on "Civil Aviation"

The first instalment of these appears on page 528 of this issue. - Aeronautical Engineering : Supplement to The Aeroplane, September 15th, 1920. pg 515

22 September 1924 - Aviation Weekly - The July 31 report of the R.C.A.F. branch of the National Defense of Canada shows that the civil aviation certificates and licenses in force were as follows.

Private air pilots 7.  
commercial air pilots 54,  
air engineers 226,  
registered aircraft 35,  
air harbour licenses 23.

22 September 1920 : UK - Aeronautical Engineering supplement to the Aeroplane pg 572 : SITUATION VACANT.

DIRECTOR-GENERAL required for the Canadian Air Board, Ottawa, Canada.

Starting salary \$4,300 dollars per annum, rising to maximum of \$5,100 dollars by annual increments of \$300 dollars.

Candidates must have:

education equivalent to graduation in engineering from a school of applied science of recognised standing;

five years of experience in the design and inspection of aircraft;

a thorough knowledge of standard types of aircraft ;

a high degree of organising and administrative ability.

Preference will be given to candidates who have been on active service.

Application forms may be obtained from the Canadian liaison officer, The Air Ministry, London..

Applications must be filed with the Civil Service Commission, Ottawa, not later than October 4th, 1920

29 September 1929 : UK - The Berkshire Aviation Co. tour of the English provinces - Ex-RAF Lieut. J. C. C. Taylor, A.I.Ae.E., who was flying at Southport all last, year, is carrying out the duties of Ground Engineer. Aeronautical Engineering : Supplement to The Aeroplane, September 29th, 1920. pg 598

29 September 1920 : UK : CANADIAN AIR BOARD SPECIFICATIONS FOR

EXPLORATORY AND FOREST PATROL AIRCRAFT.- In an explanatory letter signed by the Secretary of the Air Board, the following statement is made :—

"The Air Board has under consideration the purchase of a number of aeroplanes, seaplanes, and flying boats.

As the war type machines now in possession of the Canadian Government become obsolete, it is the intention of the Air Board to replace them with the most modern commercial machines available.

The attached draft sets forth the requirements which the Technical Officers of the Air Board consider should be embodied in accepted types of aircraft.

"It is the policy of the Air Board to purchase one each of several types of aircraft and, after exhaustive tests in Canada, to standardise the types found to be most suitable and to order in quantities.

" You are therefore invited to tender for aircraft as per attached.

"Delivery of machines will be required on or before March 1st, 1920

The work for which they will be mainly needed will be photographic exploration and forest protection.

The requirements for both types of work will be very similar.

The country over which flights will be made is very rough and uncultivated, with aerodromes few and far between.

Long distances will have to be traversed from the bases, and it is essential that the engine and installation be of the most reliable type possible as a forced landing in a country devoid of roads or railways would mean total loss of the machine unless repairs can be effected on the spot by the crew.

The only months free from ice and snow in the northern parts of Canada are April to November.

If flying is to take place all the year round, all types of aircraft must be able to land on snow and ice, and proper provision must be made for this fact in the design.

One even more difficult problem is introduced by the fact that for a certain period in the spring and the autumn it will be difficult to find either open water for seaplanes to land on or ice sufficiently strong to bear a machine at rest.

A proper consideration of these points should be made in tendering to the specifications.

The Types Required.

The specifications issued call for four distinct types-of aircraft: single-engined flying boats, single-engined aeroplanes, single-engined float seaplanes, and twin-engined aeroplanes.

In certain respects similar requirements are made for all four types.

## Notes on "Civil Aviation"

The hull or fuselage of all types must be: considerably larger than is customary in war-time types, and as free from internal cross-bracing as possible to provide a maximum stowage space.

Seating accommodation for pilot and three passengers is required in all types.

Provision for landing on snow or ice must be made.

Ten hours' petrol capacity at cruising speed is required in each case, and dual control is to be fitted.

The Rolls-Royce Eagle VII modified is specified as the power plant in every case, except in the case of the twin-engine aeroplane, when the choice is open as between "any standard type in production."

Provision is to be made for warming oil leads and water connections for winter flying, and a radiator system should provide for extremes of temperature ranging from 60 deg. below zero to 100 deg. F.

Machines must be so arranged that open types can be converted to cabin type to protect the crew in winter flying.

The largest possible cargo capacity consonant with the other requirements of the specifications is demanded.

A factor of safety of not less than 8 to 1 is required through-out.

The more specific requirements of the particular types are given hereafter.

### 1.—Single-engine Flying Boat.

The hull may be either: "box" or "Linton Hope" construction, of diagonal planking, Consuta, or a combination of both, or of metal construction, designed to stand more wear and tear than those of war-type hulls.

Hulls are to be provided with bulkheads and a drainage system, drained into a well provided with Kingston valve, or a self-baling cockpit.

The hull to be as clear as possible for stowage.

The type will be used extensively on inland waters, and it is suggested that therefore a more efficient planing bottom than those of the war types can be designed.

It is imperative that the boat take off with full load from fresh water at 3,000 ft. above sea level in a distance of 600 yards.

Ailerons and rudder arc to be balanced, the elevator may be so.

Folding wings are desirable.

Petrol is to be fed from tanks in hull to gravity tank in top centre section by rotary pumps.

arrangements for rapidly filling main tanks from a central supply are needed.

Speed all out not less than 100 m.p.h.

Rate of climb relatively unimportant, but first 2,000 ft. must be climbed rapidly.

Ceiling fully loaded 14,000 ft.

Landing speed, as low as possible.

Provision to be made for an aerial camera to operate through an opening in the hull. This opening to be closed by a screwed down deadlight.

### 2. - Single-engined Aeroplane.

Seats for three passengers to be removable to allow space for extra cargo. The undercarriage to be designed to provide great strength to meet rough landings on uneven ground, and must provide for landing on snow and ice.

The petrol system is to provide both pressure and gravity feeds to the carburettor.

Main tank to be between engine and pilot.

Provision for as large a load of cargo as is compatible with the other requirements is necessary.

Speed not less than 120 m.p.h. Rate of climb, ceiling, and landing speed as in single-engine flying boat.

### 3.—SINGLE-ENGINE FLOAT SEAPLANE.

Seating for three passengers and the maximum of free space for cargo in the fuselage is required. Floats of solid construction adequately drained and bulkheaded are called for. They must be arranged so that they do not interfere with the field of view of an aerial camera with 6 in. lens installed in the fuselage. Snow and ice landings must be provided for.

A tail float is optional, but a preference is expressed in the specification for long main floats and no tail float. Ailerons and rudders are to be balanced; the elevator is optional in this respect. Folding wings are desirable.

Petrol system combining gravity and pressure feeds, with rotary pump feed to gravity tank, the latter to be in the wings. Tanks to be rapidly fillable from a central supply.

Speed not less than 100 m.p.h. Climb, ceiling, and landing speed as in previous specifications.

Special stress is laid on the importance of designing for lasting qualities. The substitution of metal for wood, or any other means taken to prolong the life of aircraft and hence reduce depreciation, will be favourably regarded by the Air Board

### 4 - Twin-Engine Aeroplane.

General requirements exactly as in the single-engined machine. Only machines capable of flying in the air with full load and one engine completely cut out will be considered.

## Notes on "Civil Aviation"

Speed not less than 100 m.p.h. Climb, ceiling, and landing speed as before.

[It is very obvious that in the above specifications a very earnest effort has been made to leave the greatest possible scope to individual designers in regard to arrangement and construction. Nevertheless, it is feared that the performances specified will scarcely be reached in any of the single-engined types, as a rough' computation of the weight of power plant, fuel and oil, crew and passengers, called for comes to very nearly 10 lb. per h.p. of the engine specified, without any allowance for the weight of the machine itself, or for any added cargo.

This leaves a very small margin for construction to reach a speed of 120 m.p.h. and a ceiling of 14,000 ft.— C.G. Grey - Aeronautical Engineering : Supplement to The Aeroplane, September 29th, 1920. pg 584.

29 September 1920 : Aeronautical Engineering : Supplement to The Aeroplane, September 29th, 1920. pg 604 SITUATION VACANT - TECHNICAL DIRECTOR required for Canadian Air Board, Ottawa, Canada.

Salary \$4,500 per annum, rising to maximum of \$5,100 by annual increments of \$300.

Candidates must have: education equivalent to graduation in engineering from a school of applied science of recognised standing; five years of experience in the design and inspection of aircraft; a thorough knowledge of standard types of aircraft ; a high degree of organising and administrative ability.

Preference will be given to candidates who have been on active service. Application forms may be obtained from the Canadian liaison officer, The Air Ministry, London, and must be filed with the Civil Service Commission, Ottawa, not later than October 4th, 1920

13 October 1920 : The Aeroplane pg 664 : SITUATIONS VACANT.

1. AERO - RIGGER required immediately for work in a British Colony.
  - Sound knowledge of rigging and handling flying boats and seaplanes essential, preferably Supermarines and Avros;
  - Must be capable of stripping and recovering planes, with a knowledge of hull work.
  - Must qualify for Ground Engineer's certificate.
  - Preference given to ex-R.A.F. men.
  - Position requires energy and keenness for pioneer work.
  - Strict soberness essential.
  - Apply by letter only, stating full record and enclosing references, to Major Cochran- Patrick, 166, Piccadilly, W.i.
2. AERO - SAILMAKER required immediately for work in a British Colony.
  - Sound knowledge of rigging and handling flying boats and seaplanes essential, preferably Supermarines and Avros;
  - Must be capable of stripping and recovering planes, with a knowledge of hull work.
  - Must qualify for Ground Engineer's certificate.
  - Preference given to ex-R.A.F. men.
  - Position requires energy and keenness for pioneer work.
  - Strict soberness essential.
  - Apply by letter only, stating full record and enclosing references, to Major Cochran- Patrick, 166, Piccadilly, W.i.
3. AERO - ENGINE FITTER required immediately for work in a British Colony.
  - Sound knowledge of Beardmore and Clerget engines essential.
  - Sound knowledge of Supervision of workshops essential.
  - Must qualify for Ground Engineer's certificate.
  - Preference given to ex-R.A.F. N.C.Os., especially those who are known to Majors H. Hemming and Cochran-Patrick.
  - Position requires energy and keenness for pioneer work and experience in handling of men.
  - Strict soberness essential.
  - Apply by letter only, stating squadrons and COs. served under, and enclosing references, to Major Cochran-Patrick, 166, Piccadilly, W.i.
4. FOREMAN required immediately for work in a British Colony.
  - Sound knowledge of Beardmore and Clerget engines essential.
  - Sound knowledge of Supervision of workshops essential.
  - Must qualify for Ground Engineer's certificate.
  - Preference given to ex-R.A.F. N.C.Os., especially those who are known to Majors H. Hemming and Cochran-Patrick.
  - Position requires energy and keenness for pioneer work and experience in handling of men.
  - Strict soberness essential.

## Notes on "Civil Aviation"

- Apply by letter only, stating squadrons and COs. served under, and enclosing references, to Major Cochran-Patrick, 166, Piccadilly, W.i.

13 October 1920 : UK : THE PROGRESS OF AVIATION IN CANADA : in the, Dominion up to the spring of this year, we print the Report of the Air Board for the Fiscal Year ending March 31 1920 : The Air Board Act was assented to on the 6th of June, 1919, and by Order in Council dated the 23rd of June (P.C., 1295), the Honourable A. L. Sifton was named as Chairman of the Board, Colonel O. M. Biggar, Judge Advocate General, as Vice-Chairman; the Honourable S. C. Mewburn, Minister of Militia and Defence, as the representative on the Board of the Department of Militia and Defence; the Honourable C. C. Ballantyne, Minister of the Naval Service, as the representative on the Board of the Department of the Naval Service, and Dr. R. M. Coulter, C.M.G., Deputy Postmaster General, Mr. J. A. Wilson, Assistant Deputy Minister, Department of the Naval Service, and Mr. E. S. Busby, Chief Inspector of the Department of Customs and Inland Revenue, as the remaining members of the Board.

The Board was called together immediately, and considered the organisation of a staff. After consultation with the Civil Service Commission, it was decided that the work under the Board should be divided into three branches, having at their heads respectively a Superintendent of Flying Operations, a Superintendent, Certificate Branch, and a Secretary, the proposal being that the Secretary should administer the internal office organisation, that the Superintendent of Flying Operations should control all civil Government flying, and that the Superintendent of the Certificate Branch should conduct that portion of the administration which related to the public and was concerned with the licensing of personnel, aircraft and air harbours. The organisation thus outlined was formally communicated to the Civil Service Commission on July 15th, with a request that provision should at once be made for the appointment of these three officers and a medical officer for the Certificate Branch. No appointments were, however, made until after some time, and the first appointees assumed their duties as follows : On November 3rd, Lt.-Col. I: Stanley Scott, M.C., A.F.C., Superintendent, Certificate Branch; on Nov. 10th, Major A. M. Shook, D.S.O., D.S.C., A.F.C. and Croix de Guerre, Secretary, and Captain F. R. Smith, Medical Officer; and on December 15th, Lt.-Col. Robt. Leckie, D.S.O., D.S.C., D.F.C., Superintendent of Flying Operations

Permanent office accommodation was made available for the Board's staff only on the 24th of December.

### 2. Air Regulations .

The only step which, before the appointment of technical officers, it was possible to take in the direction of regulating and controlling aerial navigation was to prohibit dangerous flying. An Order in Council for this purpose was passed on July 7th (P.C. 1379). The drafting of a complete set of regulations was, however, proceeded with, and was completed in time for their submission to and approval by the Governor

in Council on (he 31st day of December. The Canada Gazette

,  
containing the regulations, was published on the 17th of  
January,

\_ 1920, and at the same time there was ready for  
distribution a book containing not only the regulations, but  
also the forms settled for use under them, the Air Board Act  
and the Convention relating to International Air Navigation  
as drafted by a sub-commission constituted as part of the organisation of the Peace Conference and approved by the  
Supreme Council. This book has already had a wide distribution.

### 3. Preliminary Surveys for Operations.

In November steps were taken to have made a preliminary  
survey with a view to ascertaining what public services could  
more efficiently and, in the broadest sense, more economically  
be performed by air than by existing methods. Canada was,  
for this purpose, divided into four parts, and ex-Royal Air  
Force officers borrowed or temporarily employed for the purpose.  
The survey was completed by the end of the year,  
and on January 2nd these officers assembled at Ottawa and the  
situation was thoroughly canvassed, with the result that it  
was decided that the most favourable fields for the commencement  
of operations were the less thickly settled and less  
thoroughly explored portions of Canada. An interdepartmental  
conference was accordingly held on January 10th. An  
agenda for this conference, including memoranda on the  
probable cost of operating aircraft, and on their use for purposes  
of survey and for fire protection, was distributed, and  
a number of places were named as possible air stations, upon  
the utility of each of which discussion was invited. The  
usefulness of this preliminary conference was reduced by the  
non-participation of some of the departments which it was  
expected would be interested, but special discussions have  
since been carried on with those departments which were  
represented, and some others. Proposals have been formulated  
for operations next summer.

### . 4. Scientific Research.

: Among the duties imposed upon the Board is that of undertaking  
technical research for the development of aeronautics  
and of co-operating for that purpose with other institutions.  
In execution of this duty, discussions took place with the  
Honorary Advisory Council for Scientific and Industrial Research,  
which resulted in the formation under that Council

,  
of an Associate Air Research Committee, which held its first  
meeting on the 7th of February. Professor A. S. Eve, Professor  
of Physics at McGill University, was selected as Chairman  
of the Committee, and Mr. R. J. Durley, Secretary of the  
Engineering Standards Association, as its Secretary. Other  
members of the Committee are Professor J. C. McLennan,  
Professor of Physics at the University of Toronto, and Mr.  
J. R. Parkin, Lecturer in the Faculty of Applied Science in  
that University. This Committee will work in the closest  
co-operation with the officers of the Air Board, and will coordinate  
aeronautic research throughout Canada.

### 5. Meteorological Development.

The importance of meteorological information to air navigation  
cannot be over-estimated, and arrangements have been

completed with Sir Frederick Stupart looking towards the necessary developments of the meteorological reports, the undertaking of meteorological observations at air stations operated under the Air Board, and the distribution of -meteorological information.

6. Wireless Installations and Navigators' Certificates.

The development of air navigation will involve a considerable extension of wireless communication, and arrangements have been made with the General Superintendent, Government Radio Telegraph Service in the Department of Naval Service, for this purpose. Air pilots who require wireless qualifications will obtain them through that Department, by which will be issued licences for the necessary installations both in aircraft and on the ground. That department has an organisation extending throughout Canada, and duplication of officers is thus avoided. Like arrangements are expected to be made with the Department of Marine and Fisheries for the issue of navigators' certificates to air pilots who desire or need them. The existing organisation under that department extends throughout Canada and undertakes the examination and qualification of marine navigators. As the problems met with in air navigation are very similar to those which present themselves in marine navigation, this arrangement is, expected to be both economical and satisfactory.

7. Aircraft and Equipment.

Negotiations have been entered into looking towards the taking over by the Air Board of the seaplane stations erected during the war by the Department of the Naval Service at Halifax and Sydney, and that portion of Camp Borden which was developed as an aerodrome by the Royal Air Force and acquired by the Department of Militia and Defence after the conclusion of the war. The equipment which will come under the control of the Air Board from these sources has an estimated value of \$170,000. In addition to the aircraft and equipment thus acquired, sixteen machines, of an approximate value of \$100,000, are being received from the Air Ministry by way of replacement of those presented from time to time during the war to the Canadian Forces through the activities of the Overseas Club, and the Imperial Government is also presenting to Canada aircraft and equipment of the value of about \$5,000,000, including

— So aeroplanes, 14 flying boats, 12 airships, 6 kite balloons, with inflating plants and sheds, 300 motor and other vehicles, and a substantial amount of armament, wireless instruments, cameras, and other technical and general stores. A considerable part of this gift has already been shipped, and shipment of the remainder will not be long delayed.

8. Mapping

At the request of the Air Board, the Dominion Geographer has commenced the preparation of aeronautical maps on the system laid down in the Convention relating to International Air Navigation. The process of completing the mapping of Canada on this system will necessarily be a very long one.

9. Canadian Air Force.

The question of the constitution of a Canadian Air Force was an early subject of consideration by the Air Board, and on December 22nd there was adopted, for submission to Privy

## Notes on "Civil Aviation"

Council, a memorandum covering the general lines of the organisation proposed. A final decision on this subject was however, postponed until the general policy with regard to Canada's future sea, land and air forces was determined and it has consequently not been possible to take any further steps in this direction.

The very large number of ex-officers and airmen of the Royal Air Force in Canada are expected enthusiastically to support the proposals if it is found possible to adopt them.

### 10. Aeronautic Intelligence.

The Air Board Act imposes upon the Board a duty "to study the development of aeronautics in Canada and other countries." In the execution of this duty the Air Board has had the advantage of the work done before its constitution by the Intelligence Branch of the Canadian Air Force under the Ministry of Overseas Military Forces of Canada. This Branch, during the two years of its existence in London, had collected material of very "great interest and value, and its papers were, in the course of the demobilisation of the Canadian Expeditionary Force, transferred to the Air Board, which also secured the services of one of the officers chiefly responsible for its administration. The Air Board consequently has available fairly complete sets of drawings of almost all standard British machines, engines and equipment, with specifications for the construction of many of them, and had also an adequate collection of technical publications, reports and documents. The Intelligence Branch of the Canadian Air Force, O.M.F.C., established communication with the chief aircraft manufacturing companies, and this communication has been maintained, with the result that the Air Board secures early information of developments in design and other inventions having an importance from an aeronautical point of view. With this material it is able to deal with the problems which present themselves to commercial and other companies, and which require solution in connection with operations undertaken on behalf of the Government.

31st March, 1920.

[Since the above Report was issued the Canadian Air Board has been reconstituted. The members are now as follows : Chairman, Mr. Guthrie, Minister of Militia; Vice-Chairman, Col. Biggar; Naval representative, Captain Walter Hose, R.C.N. ; Civil Government Operations, Lt.-Col. R. Leckie, D.S.O., D.S.C. ; Commercial "Aviation. Lt.-Col. Scott; Air Force representative, Major-General Gwatkin, Inspector General Canadian Air Force ; Interior Department representative, Dr. Deville, Surveyor-General.—Ed.]

October 1920 : UK : Discussion from the 1920 Air Conference published in Aeronautical Engineering supplement to the aeroplane pg 674 : Air Vice-Marshal Sir E. L. Ellington, K.C.B., C.M.G., C.B.E., Director-General of Supply and Research -

### THE PRESENT POSITION OF AIRCRAFT RESEARCH AND CONTEMPLATED DEVELOPMENTS :

Air Vice-Marshal Sir E. L. Ellington, K.C.B., C.M.G., C.B.E., Director-General of Supply and Research

During the war the impetus was entirely military, the all important factor in research being speed of progress in the development of fighting machines. There was no time to devote to lines of research which did not promise practical results almost immediately in view of the prospective end of the war, with the result that aircraft and engines produced during the war were almost entirely developments of pre-war types. The progress made in armament, navigational instruments and other accessories, with little or no pre-war experience available, was more fundamental.

Such an opportunist policy as the war demanded is, however, quite unsuitable for times of peace.

It is no longer a sound policy to sacrifice everything to immediate results and accept the risks involved in decisions based upon insufficient technical data ; the principles of scientific research must once more be rigidly applied, and progress only sought along a line of advancement upon which each successive stage is thoroughly explored and understood before the next is attempted.

### Present Position and Contemplated Developments.

The main developments now in progress or under contemplation for military and civil aircraft were dealt with under the following heads :—

- (a) Aeroplanes and seaplanes, and engines.
- (b) Airships and kite balloons.
- (c) Navigational instruments and apparatus.
- (d) Accessory developments to increase the comfort, safety, and efficiency of the passengers and crew.

- (a) Aeroplanes and Seaplanes and Engines.

## Notes on "Civil Aviation"

The main requirements for aeroplanes and seaplanes were stated broadly :—

- (i) Reliability; (ii) Controllability; (iii) Capacity to take off or land in a restricted area ; (iv) Performance ; (v) Safety and comfort ; (vi) Cheapness.

(i) Reliability.—

Reliability is largely a question of engine, and more particularly engine accessories, such as magnetos, and petrol, oil and water cooling systems. The new types of engines now being considered were considered under this heading. Apart from normal developments of existing types, these include the steam turbine, the "swash-plate" engine, wherein the crankshaft is replaced by an inclined disc, and the cylinders are parallel to the shaft, and the possible application of the Diesel principle to aircraft engines.

(ii) Controllability.—

This question was reviewed with particular attention to the control of big engined machines, and the problems affecting those with a central engine room.

(iii) Capacity to take off or land in a restricted area.—

This is of the greatest importance in both civil and military machines. The problem is mainly one of wing and propeller design, and particularly the development of a satisfactory variable camber wing. The Fairey variable camber device and the Handley Page wing were referred to in particular, and the latter described as a wing fitted with a false leading edge carried ahead of the true edge with an air space intervening. Reference is also made to the question of landing aircraft on ships.

(iv) Performance.—

In military machines, the need for performance is paramount, and while it is also important for civil machines, considerations of reliability, comfort, etc., must receive greater weight. The development of engines from the point of view of lightness was discussed.

(v) Safety and comfort.—

The steps which are being taken to promote safety and comfort of passengers and crew were dealt with later in the paper.

(vi) Cheapness.—

The importance of cheapness in construction and maintenance is self-evident for civil aircraft, and it is also of the greatest importance for war purposes in that cost is a reflection of time and labour expended. Efforts are being made to produce more durable machines by introducing a wider use of metal construction. Metal propellers are also being developed, and cheaper forms of fuel are being investigated.

(b) Airships and Kite Balloons.

(i) Airships.—The construction of rigid airships in this country is entirely a war development. The first ships built followed closely the established German practice, but there are now under construction two ships embodying new principles of hull construction which have been developed in this country—the R.30 and R.38.

An insight into the most recent German practice has been afforded by the surrender of the L 71 and L.64, the most noticeable features of which are the construction of the gas bags, and the arrangement and reliability of the machinery. In both these directions special research is being undertaken. Considerable success has attended the efforts made to develop a method of anchoring airships in the open by means of mooring masts, thereby obviating the necessity of sheds except for extensive repairs.

The possibility of carrying aeroplanes on airships is also being investigated. Research is being carried out on a variable pitch propeller for airships, and also on methods of recovering the water from the exhaust gases of the engine, which, if lost, means a reduction of weight of ballast, thus necessitating a discharge of gas.

(ii) Kite Balloons.—Though it is not anticipated that kite balloons will be used again for observation as they were in the recent war, captive balloons have a value for meteorological and other special purposes which are being investigated.

(c) Navigational Instruments and Apparatus.

The development of compasses, turn indicators, and other instruments, were discussed, including directional wireless and navigation by astronomical observations. The principal difficulty in navigation at the present time is landing in fog, and the hope was expressed that a solution may be found to the problem of fog dispersal. In the meantime, efforts are being made to mitigate the difficulty by means of landing flares and electric lighting- devices similar to

## Notes on "Civil Aviation"

those now employed for landing by night As fogs are normally confined to a few hundred feet from the ground, devices for landing a machine automatically from a known height are being explored. Two methods for finding the true height of an aeroplane from the ground (or sea in the case of seaplanes) are being investigated ; one by means of sound, and the other by the use of wireless telegraphy. (d) Comfort, Safety and Efficiency of Passengers and Crew.

The most important lines of development under this head are those directed to the prevention of fire and the use of parachutes.

In order to minimise the risk of fire, the separation of the passengers and crew from the engine and petrol tanks by means of bulkheads is being considered, as also are devices for releasing petrol tanks in case of fire. For military machines, improvements in self-sealing tanks to withstand incendiary bullets, and also tanks which offer the least chance of catching fire in a crash, are being investigated. The provision of parachutes is a controversial question.

Against the obvious advantages are to be set the fact that it is only when a machine has got out of control that the call for a parachute descent would arise, and in these circumstances the question of getting clear would be a very difficult one. In all machines, and particularly military ones, the extra weight is a consideration. There is no doubt, however, that the provision of parachutes may be the cause of some lives being saved, and for that reason they are now being fitted in all R.A.F. machines of the small types where possible. [It should be noted that this is the first official statement, that parachutes are to become a standard part of the equipment of the R.A.F.— Ed.]

Two types of parachutes are being developed : one in which the occupant jumps from the machine, and the other in which the parachute is blown open as the machine descends, thus lifting the occupant clear.

An important source of accidents is that due to starting engines by propeller swinging. To meet this, mechanical starters are in existence, but a successful starting apparatus which forms an integral part of the machine and its engine has not yet been tried out. From the point of view of comfort, mention was made of oxygen apparatus, electrically heated clothing, and other improvements of a less important nature.

### The Discussion.

After the Chairman had complimented Air Vice-Marshal Ellington on his paper and had pointed out that the exigencies of time made it necessary to restrict speakers in the discussion to ten minutes each, he called upon *Sir Richard Glazebrook—late of the N.P.E.; now Zaharoff Professor of Aeronautics* to open the discussion.

Whereupon Sir Richard proceeded for the space of some thirty-five minutes to bore the assembled company with a long account of how keenly alive he, the Aeronautical Research Committee, the N.P.E., and various other bodies and persons were to the importance of researches of the type dealt with in the paper and to the necessity of training competent persons to carry on such researches in the future.

In no sense did he contribute to the elucidation of the problems which now confront the art of aviation, and he very effectively prevented several others who could have done so" from speaking at all.

It is high time that a strict training in humility were made a compulsory part in the education of all scientists. Fortunately,, the ribald remark of one auditor that " Men may come and men may go, but Glazebrook goes on for ever," was not strictly accurate, and he eventually gave place to Mr. F. M. Green.

Mr. Green joined issue with Air Marshal Ellington on one or two points. In the matter of the cantilever type wing he objected that there was no actual reduction in the amount of vulnerable bracing—it was merely put where it was invisible.

The cantilever wing might have other advantages — he thought it had—but not this one. One of the vital features of the development of aircraft was the maintenance of a high standard of detail design. Bad detail design would mar a machine based on the soundest aerodynamical principles, but good detail work could pull a basically inferior design through to success.

The war had produced numbers of capable draughtsmen with experience in detail work, and loss of their services would be a severe handicap to the aircraft industry.

The only way of retaining the services of those who remained was for the Air Ministry to give designing firms experimental machines to design and build. Mr. Chorlton, of the engine department of Beardmores, Ltd., said that engine designers were now placed in a difficult position by the lack of precision in the statements made by different authorities as to the requirements for commercial aero engines. These were roughly two schools. One called for reliable engines—heavily built and of low fuel consumption. The other school said that heavy engines could not be tolerated as they reduced the available ' cargo capacity to below the paying limit. It was gathered that what he asked for was ^ a statement from aeroplane builders as to exactly what extra weight per h.p. they were prepared to tolerate as the price of improved reliability. He pointed out that heavy engines could not

## Notes on "Civil Aviation"

possibly make up for their own weight by their improved fuel economy except on long distance journeys, and that airships therefore gave more scope for heavy types—particularly the so-called Diesel.

Incidentally, he objected to the term Diesel; the engine usually known as the Diesel type operated on an English cycle—the Stuart Akroyd—and there was no need to use a German label for it. [Which is as perfectly true as that aniline dyes were a British invention, and that in both that case and the one now in question it required German pertinacity and business sagacity to turn the invention to profitable commercial uses.—Ed.

On the subject of the steam turbine he asked for more light. Steam had many valuable features as an aircraft prime mover, but as the best thermal efficiency attainable in the relatively small turbine units Necessary for aeroplanes was about 15 per cent., as against the 30 per cent, of the internal combustion engine, he failed to understand how Marshal Ellington hoped to achieve reasonable fuel consumption. As to the limiting size of aero engines he did not believe in the limit of 100 h.p. per cylinder.

If aeroplanes called for 5,000 h.p. engines in the next few years, he thought they- could be built as quickly as the aeroplanes were built to take them. As regards supercharging and forced induction there was another use than that of maintaining power at altitudes. The method could be used to give an engine a 25 per cent, excess over normal power for getting oil or surmounting obstacles, and afterwards substituting an inert gas for part of the air, for keeping a high compression and consequently a low fuel consumption during normal flight.

Mr. Calthrop, of the "Guardian Angel" parachute, then discussed the parachute problem.

Unfortunately, owing to large numbers of the audience leaving the chamber, his remarks were practically inaudible.

### May 1920 : Ottawa : Air Board of Canada : Bulletin No. 1

---

AIRCRAFT DEPRECIATION AND COSTS - document, at once instructive and amusing, has been issued by the Air Board of Canada as Bulletin No. 1 :—

It is a well-known fact that auditors now accept as an axiom that 111 commercial life as many firms fail through not knowing their cost price as from any oilier single cause. If this is true of ordinary every-day "business life it is going to be very greatly accentuated in commercial aviation. At the present moment it is probably safe to say that of the various firms engaged in the operation of aircraft commercially, not one knows with any degree of certainty their cost.

This item, as everyone is aware, is made up of various factors which might be tabulated as:

cost of operation,  
cost of interest on investment, and  
cost of depreciation.

It is a comparatively simple matter to arrive at an exact total for the first two, but the third is always difficult to determine.

*Experience in operating of aircraft on anything like a large scale dates entirely from the outbreak of war.*

So very little was done in aviation *prior to 1914* that *the knowledge gained of aircraft as a commercial proposition was negligible.*

War experience is, unfortunately, of such a nature as to be of little use when considering the operating of aircraft from a commercial point of view.

The result is that today all aviation companies are more or less in the dark and merely waiting the results of their first year's operations to determine with some degree of certainty the various figures which will go to show them whether or not they have made a loss or a profit.

A typical state of affairs might be mentioned when the writer called upon the managing director of one of England's greatest aircraft concerns for the express purpose of finding out how this company estimated depreciation. The statement given was, "*We have very little idea what our depreciation is, but we are accepting as an arbitrary figure 100 per cent, per annum per machine.*"

Further inquiry amongst the various commercial concerns in England elucidated the fact that each one was as much in the dark as the one quoted. The inference is obvious. These very large concerns are operating, hoping they are making a profit, but totally unable to say definitely that they are.

## Notes on "Civil Aviation"

*The airy way in which the average pilot dismisses the question of costs from his mind may have been well enough during the war when all efforts had to be concentrated upon winning the war irrespective of whether it was won at a price of £8,000,000 per day or £80,000,000, but this state of affairs, of course, cannot continue and business men demand figures, not theories.*

A close study of the question, combined with details gleaned from records kept during four years of aerial warfare, such information as has been gained by conversations with those interested in commercial aviation in England, and the study of figures compiled in the States, has resulted in the following estimate of that major portion of the cost of aerial operations, depreciation.

For purposes of reducing depreciation to a percentage basis this factor has been divided into two portions, A and B.

A.—Constant Depreciation.

B.—Depreciation due to flight.

(i) Crash risk.

(ii) Deterioration.

I will now endeavour to explain these items.

A : -

Constant Depreciation:

Everyone who has been connected with aircraft knows that if an aeroplane or seaplane is placed in a hangar and left there for a period of years, despite reasonable care being taken of it, at the end of a certain period of time the machine will have lost a great portion of its former value.

In the first place the fabric will have become soggy and certain parts of the woodwork will in all probability have warped.

This depreciation would in time entail a very thorough complete overhauling.

A still more serious factor that has to be considered, however, is the fact that *in a period of years, due to obsolescence the machine will have lost practically all of its former value.*

It is reasonably safe to say that the machine of to-day will not be flown in general use four years hence.

Type and kind is constantly in a state of evolution and of this fact one must not lose sight.

This is particularly true at the present time when *practically all machines on the market have been built for war purposes with the lowest possible factor of safety and the greatest possible speed and climb.*

One might instance the case of the various types of training machines on which many of the leaders of this article learned to fly.

It is almost ludicrous to cast one's mind back to even such a recent date as 1915 and think of the:

Maurice Farman Long Horns

Maurice Farman Short Horns,

Graham-White Henriques and the

Henri Farmans,

on which we used to make our earliest efforts.

These machines have long ago become obsolete for all purposes and if any survive to-day their market value is practically nil owing to this factor of obsolescence.

It is difficult to estimate this constant depreciation accurately, but if one accepts a maximum of three years as being the usual period of time during which a war type of machine may be expected to serve a useful purpose, then we get a figure of approximately 3 per cent, per month constant depreciation.

It is emphasised, that this estimate must be taken into account whether the machine is flown or not.

B.

—

Deterioration due to flight.

(i) Crash risk.

(ii) Deterioration.

(i) Crash risk.— Everyone who has had any experience of flying knows of the large crash risk that was incurred during the war in the operating of aircraft. One had only to stand on a busy aerodrome any day when machines were constantly landing or taking off, to see how large this factor is in the percentage of costs. No matter how sidful the pilot accidents will happen even in peace and the resulting expense involved in repairing the aircraft will be considerable.

Difficulty is again experienced in estimating the usual amount of time a machine can in peace be flown without being crashed.

Practically all we have to guide us is the war experience of war pilots. " In this connection one can recall the very considerable publicity given to a young gentleman in the R.F.C. who was heralded by the Illustrated Daily Press as the "Crasher King," having survived no fewer than seventy eight crashes.

## Notes on "Civil Aviation"

History does not relate why he was permitted to continue on his career of vandalism.

One also can recall a very senior officer of the R.N.A.S. whose enthusiasm for flying very greatly over-balanced his skill as a pilot, and whose write-offs in the aggregate must have amounted to a prince's ransom. *Needless to say, there is no place in civil life for this type of pilot*, and, happily, at least one pilot is known to the writer who has completed 1,000 hours flying in France without a single write-off against him.

*Investigation of the subject seems to indicate that among high-class pilots one must look for a complete write-off in aeroplanes every six hundred hours and in seaplanes every five hundred hours.*

This record will probably improve very considerably as war-time machines give place to commercial types, but until the war products are used up it is not considered safe that one should figure any less than one-sixth of one per cent, per flying hour crashes against aeroplanes and one-fifth of one per cent, per flying hour against seaplanes.

It may be explained that the loss in seaplanes is usually greater than in aeroplanes, as slight accidents often result in the seaplane sinking, thus converting a "partial" into a "total" loss.

(ii) Deterioration.

the last factor to be considered is deterioration. Every type of aircraft has a flying life, that is to say, after a machine is erected and flown a time will come when, apart from crashes, it will become unfit for further service. This life must, of course, differ in different types of machines, the life of some being greater as the factor of safety of the machine is higher and landing speed lower, etc.

For other types of machines the life will be shorter. *One type of machine may be instanced which probably has the worst flying record of all, the flying-boat.* In one of the largest seaplane stations in England it has been found from careful records of figures kept *during the war that the life of the hull of large flying-boats was just over seventy hours.* This figure excluded all war risk and simply took care of wear and tear. *In another squadron of the same type of machine the average was 103.*

On the other hand, *we find examples of aeroplanes whose life averaged between 700 and 800 hours, and in one or two instances the known life of an aeroplane has even been as great as 1,000 hours with only very minor repairs.*

*A careful study of all figures available seems to indicate that the average flying life of an aeroplane may be stated to be 700 hours and of a seaplane 400 hours; or, in other words, that the allowance for deterioration should be at the rate of one-seventh of one per cent, per flying hour for aeroplanes and one-quarter of one per cent, per flying hour for seaplanes.*

It now becomes apparent that A and B must be considered separately.

*In the event of an aeroplane being bought and not flown* the only factor that need be considered is constant depreciation, since the machine is not subject to either crash risk or deterioration due to wear and tear.

*In the event of a machine being used during the summer months only and stored during the winter months,* it will be necessary to charge depreciation under different headings.

In other words, during the winter months when machine is stored depreciation should be charged as shown in A.

A.—Constant depreciation—3 per cent, per month.

The two remaining factors to be considered are

B (i) Crash risk and

B (ii) Deterioration.

B (i)—Crash risk. It is obvious that since under B (ii) the aeroplane is to be written off in 700 hours it will be unnecessary to insure it against crash risk beyond that period. It is also obvious that it is unnecessary to insure a machine against crashes right up to its full value if the machine has done, say, 699 hours' flying. B (i) should therefore be estimated on a sliding scale, or, for the purpose of averaging, the figure of one-half of one-sixth—or one-twelfth—per cent, per flying hour may be taken as an equitable basis.

B (ii)—Deterioration. This factor may be considered as stated one-seventh of one per cent, per flying hour. In adding the above figures together we find that on an aeroplane detailed to carry out certain operations lasting six months and entailing 300 hours' flying, the cost of the machine being 10,000 doll., depreciation should be figured as under r

—

B (i)—Crash risk—one-twelfth of one per cent. » per flying hour for 300 hours 2,500 doll.

B (ii)—Deterioration—one-seventh of one per cent, per hour for 300 hours 4,286 doll.

Total depreciation 6,786 doll.

If the machine is stored in a hangar for the balance of the year we will get the additional cost of :—

## Notes on "Civil Aviation"

A.—Constant depreciation—3 per cent, per month on 10,000 doll, for six months 1,800 doll.

In other words, the total allowance which should be made in calculating cost of operations or insurance and depreciation upon a new machine valued at 10,000 doll and used for operations for a period of six months, during which it was flown 300 hours, would be 6,786 doll., or sixty-seven and four-fifths per cent, of the value of the machine. It is particularly emphasised that the above calculations are based on war-type machines and with war-time experience.

These figures .will unquestionably be greatly modified as the present types of machines give place to those designed for commercial uses and as the attitude of mind created by war experience is altered under peace-time conditions.

The reader of these figures will naturally be inclined to doubt them ; certainly this figure is very large, but experience goes to prove that it is at least approximately correct.

The business man unfamiliar with the use of aircraft will immediately state that depreciation is so large as to rule out aircraft entirely as a feasible mode of transport. This I do not believe to be the case, but the estimating of the cost of operations in various parts of Canada has made it clear that if aircraft has to be used economically, every machine must be flown to its maximum capabilities. In other words, machines must not be allowed to "eat their heads off."

For example, in figuring up the cost of operations of six aeroplanes flying in all 120,000 miles, it has been found that the figure for depreciation was as low as 16.6 cents per mile out of a total of 62.7 cents per mile. In another instance, where only 50,000 miles of flying was required, the depreciation amounted to 96 cents out of a total of 2.04 doll, per mile.

Various other examples go to show that the more flying that is done the more reasonable both depreciation and operation costs become.

During the war no attempt was made to build a machine in such a way that this figure would be reduced.

The life of an aeroplane on active service was exceedingly short, whether it came to its end by crash risk, by deterioration, or at the hands of the enemy ; few machines on active service lasted much over 100 hours, hence a machine designed to stand 1,000 hours' work was merely a waste of energy.

Now that the war is over, however, and aircraft manufacturers are turning their attention to the commercial use of aircraft, serious efforts are being made to design and build machines!

That will last for upwards of 1,000 hours. Prominent in this direction is the advent of the all-metal machine.

Already very satisfactory wings have been made which, while increasing the weight only 10 per cent, over the present methods of construction, give a factor of safety of 12 instead of 6. In England to-day the largest machine ever constructed is being built of metal, and it is hoped that in this and subsequent types the life will be very much lengthened. Unquestionably this is the greatest problem facing aircraft manufacturers to-day and one that will retard the commercial use of aviation until it has been satisfactorily solved.—Ottawa, May, 1920.

### A Criticism.

The foregoing document is of very considerable interest. It is probably true to say that were the writer to resume his inquiries in England to-day he would be able to discover those who possessed very considerably more in the way of accurate information as to the depreciation of aircraft on commercial services than was available at the time his original inquiries were made. Whether he would be able to extract that information in any very useful form and, still further, whether he would be permitted to publish it, is a quite other matter.

But there are certain points whereon remark may usefully be made as to his statements, and very possibly the writer himself would now amend his views in certain respects.

On one issue a very distinct objection may be taken to his assessment of costs. This relates to the question of obsolescence. Financially, the scrapping of an obsolete type of machine is justifiable only when the substitution of a more efficient type will result in economies or in increases of revenue sufficient to pay interest on the capital represented by both the original and the new types of machines.

The sale value of an aeroplane—regarded purely as a commodity— will undoubtedly drop with its age, quite apart from any question of its material deterioration. But as part of the equipment of an aerial transport concern its value is properly what is generally known as a going concern value, and is entirely a function of its revenue earning capacity. This capacity may fall through material deterioration of the machine itself—but is then due to faulty upkeep—or it may fall through the competition of other concerns operating on the same or equivalent routes and employing more efficient types of machine. But if an aeroplane to-day can carry a given load over a given route at a given cost, there is no

## Notes on "Civil Aviation"

factor due to the age alone of that machine that will prevent it from carrying the same load over the same route at the same cost ten or twenty years hence.

To charge obsolescence as a cost is to burden the present with the cost of problematical future improvements, and in the development of commercial aerial transport represents an entirely wrong and shortsighted financial policy. To build up out of any profits available a reserve fund to facilitate the substitution for old type machines of newer and more efficient types is an entirely different affair, but to treat this item as a cost is merely to introduce, one more deterrent to the growth of the business, and hence probably effectively to remove any excuse for so replacing them.

For the remainder of the contents it may fairly safely be said that the figures given for the life of commercial aircraft are all distinctly conservative. Quite possibly the depreciations which result may approach fairly closely to the allowances necessary with existing types of aircraft operating on irregular services over bad country, but British experience of machines operating over regular routes and subject to proper arrangements for maintenance and overhaul would seem to indicate an average flying life of very much more than the 600 hours assumed by the writer. Given competent piloting over routes not worse than the London-Paris as regards facilities for landing, and modern engines properly maintained, it seems probable that at least 2,000 flying hours without a serious crash can be counted on with fair certainty—w. h. S. pg 678-680 Aeronautical Engineering (Supplement to The Aeroplane.) Aeronautical Engineering October 20, 1920

November 1920 : NEWFOUNDLAND : Seal Hunting by Airship.

Four airships:

three S.S. "Zeros" (1-75 h.p. Rolls-Royce "Hawk") and

one S.S. "Twin" (2-73 h.p. Rolls-Royce "Hawks"),

presented to the Newfoundland Government by the Air Ministry, left the Thames on Oct. 29th en route for Newfoundland onboard the S.S. Alconda.

*These four ships, with all necessary equipment and ample spares, will form the nucleus of a regular Government air patrol service, and after an experiment in seal hunting they will be used as a matter of routine in survey work and forest patrol.*

In all probability, two airships will be employed in the seal locating test, which will be made early next year. In order to intercept the herds of young seals that, immediately after the breeding season, drift down on the ice, the airships will fly over the North Atlantic and, by means of wireless, communicate the exact positions of the various herds to the sealing fleet. - Mr. F. J. Tippen, consulting airship engineer and constructor to the Newfoundland Government, in charge of the expedition. - pg 802 The Aeroplane November 17, 1920.

24 November 1920 : The Aeroplane pg 824 : AIRWORTHINESS CERTIFICATES

The following letter has been received : —

Sir—*At the recent Air Conference* I referred to the fact that airworthiness certificates issued by the Air Ministry could not be relied upon by insurance companies when writing aircraft risks and, *in consequence, machines offered for insurance had to be re-surveyed by their experts before the risk was accepted.*

*This statement has been received by certain departments of the Air Ministry with an amount of ill-feeling although I anticipated that they would welcome a criticism* which might be the means of bringing these departments into closer touch with each other, *with a view to improving the situation and ensuring a higher degree of safety in civilian machines, the present system of issuing airworthiness certificates appears to be very unsatisfactory* and would probably lead to disaster if outside influence was not brought to bear in securing greater airworthiness of machines, namely, by the survey carried out by insurance companies' experts.

It appears that, *although a machine may be considered defective in design by Government inspectors "who are deputed by the Inspection Department to finally inspect the machine for workmanship and material"*, that Department has no authority to refuse the issue of an airworthiness certificate.

The result is that, *in carrying out surveys for the insurance companies which I act for, I have been compelled to recommend the Non-Insurance of a number of machines until, some cases, considerable alterations have been made*, although the owner is in possession of a so-called airworthiness certificate.

*In the case of sales of surplus Government machines the machines are not inspected by Air Ministry inspectors, although the C.G.C.A. issues to the purchaser an airworthiness certificate with each machine.*

## Notes on "Civil Aviation"

*This system of issuing airworthiness certificates is a danger to the public, and immediate action should be taken to ensure that all machines are properly inspected and approved, as a whole by qualified engineers not war-time productions prior to certificates being issued, and that the expense of such expert inspection be borne by the owner of the aircraft and not, as is now the case, by the taxpayer.*

*Another important point, which, in the interest of the flying public, must receive attention, is the question of ensuring that machines are maintained in an airworthy condition after the issue of the airworthiness certificate.*

*Under present arrangements a machine is supposed to receive an inspection by a ground engineer before each flight. This is satisfactory, so far as it goes, but the weak link in the chain is the position of the man who carries out this inspection.*

*He certainly holds an A.M. (Air Ministry) certificate, but, at the same time, is the servant of the aircraft owner and is, in consequence, liable to dismissal should he make himself too aggressive in his demands for renewals or repairs. His position is therefore invidious and lacking in authority.*

*The future of civil aviation depends to a large degree upon the safety and reliability of machines, and until something is done to ensure this end the present half-hearted confidence of the public will continue, and insurance premiums will still figure heavily in running charges.*

(Signed) William Glass, A.M.I.Ae.E., A.M.L.A. E., Consulting Engineer to Insurance Companies, 43, Leicester Square, London, W.C.2.

24 November 1920 : The Aeroplane pg 826 - Eng Supl. : The Technical Publishing Co., Ltd., of 1, Gough Square, K.C.4, have sent for review a portly volume entitled "The Motor, Marine and Aircraft Red Book, 1920," contains the names of many prominent people concerned with aviation, though it omits quite a number of important firms, but it also includes many firms whose connection with aircraft has either ceased or is extremely remote.

The list of "Aero Passenger Services" includes several names unknown to the Aircraft Industry, and omits :  
Aircraft Transport and Travel, Ltd.,  
the Instone Air Line and  
Handley Page Transport, Ltd.

So far as one can discover by a somewhat rapid perusal, this "Directory" has not discovered the existence of any aircraft firms in the British Dominions Overseas, and it is a little interesting to note that according to the compiler, *Canada as a British Dominion does not exist. the book is not merely worthless, but a trifle worse.*

In view of the dearness of printing and the scarcity of paper it seems rather a pity to have produced the book.

The Curtiss Company Change of Ownership.

The Willys-Overland Corporation has, sold control of the Curtiss Aeroplane and Motor Corporation to C. M. Keys, who has been elected president of the Curtiss Company. - The reorganisation also involves some changes in the list of officers and directors of the company. F H. Russell has been named vice-president in place of Mr. Keys, the new president. J. E. Keppeily and W. B. Stratton resigned as vice-presidents and directors, and J. Harbeck and W. P. Chrysler resigned from the board. C. R. Keys and Nj. A. W. Smith have been named to fill the resulting vacancies.

The Curtiss Aeroplane and Motor Corporation was incorporated in 1916 and took over the business founder! by Glenn H> Curtiss. Control of the new company rested with the Willys-Overland Co. The Curtiss Company early in 1916 took over the Burgess Company of Marblehead, Mass., and controls the Curtiss Aeroplane Company, the Curtiss Exhibition Company and Atlantic Coast Aeronautical Station. In November, 1917, a new plant, which was built at Buffalo, began operation. It cost approximately 4,000,000 dollars. This plant was eventually sold to the Government. In September of last year a Bill was introduced in Congress to pay the Curtiss Corporation 6,114,126 dollars in settlement of war contracts and for the purchase of the Buffalo plant. The present plants of the corporation are at Buffalo and Garden City.

The authorised capital consists of 303,000 shares of common stock of no par value, and 6,000,000 dollars 7 per cent, cumulative preferred stock of 100 dollars par value. Outstanding common stock amounts to 218,060 shares and the preferred outstanding amounts to 5,463,100 dollars. The company has no funded debt. All of the common and preferred shares are held in a five year voting trust, expiring Jan. 14th, 1921. In the balance sheet of Dec. 31st of last year the plant is valued at 6,645,248 dollars and the goodwill at 2,297,280 dollars. Inventory at that time amounted to 2,883,818 dollars. Gross sales in 1919 were 11,805,808 dollars, and the surplus for the year before deduction of Federal taxes, was 1,939,970 dollars.

## Notes on "Civil Aviation"

### A Matter for 55.

*An ex-officer of the R.A.F., now in Canada*, writes that he has been reading with interest of the Air Ministry Competition at Martlesham, his interest being increased by the fact that Mr. Keep, the pilot of the Westland Limousine which did so well in the "small aeroplane" class, was a brother officer of his in the famous 55 Squadron, R.A.F., and won his M.C. while in that squadron. Incidentally, members of 55 may be interested to know that the squadron has recently been with "C" Force in the Middle East fighting against the Turks.

Furthermore, members and friends of the squadron are reminded that there are still a few copies of the "Chronicles of 55 Squadron" to be had at the price of ins. 6d. These can be supplied by return of post from The Akropwne, i? <., Piccadilly, W.i.

pg 833 - NEW COMPANY.

H. G. Hawker Engineering Co., Btd. (171,409).—Private company Registered Nov. 1,5th. Capital, ,£20,000 in £1 shares.

**To acquire from F. I. Bennett all the patents, rights, etc., relating to** the manufacture of motor bicycles, and to carry on the business of manufacturers of and dealers in cycles of all kinds, internal combustion and steam engines, motor cars, aircraft, etc.

The first directors are :

F. I. Bennett, 10, Cadogan Road, Surbiton, engineer;

H. G. Hawker, "Ennadale," Hook Road, Surbiton, aeroplane pilot;

T. O. Tvl. Sopwith, Horsley Towers, Surrey, engineer;

F. Sigrist, Torrington House, Wolsey Road, East Molesey, engineer;

V. W. Eyre, Honeyhinger, Hindhead, Surrey, engineer.

Qualification £500. sec , : -p. I. Bennett. Registered office : Canbury Park Road, Kingston-on-Thames.

01 December 1920 : Aeronautical Engineering Supplement to the Aeroplane :

THE IDEAL CHRISTMAS PRESENT FOR The Service or Civilian Aviator, The Technical Officer, The Ground Engineer, The Air Line Manager, The Aeroplane Designer and The Aero Engine Designer, or anybody interested in Aviation is "ALL THE WORLD'S AIRCRAFT OF 1920" - NOW READY.

All the Aeroplanes, Seaplanes, Flying Boats, Airships and Aero Engines produced since the 1919 issue in all countries are illustrated with photographs and/or scale drawings and full specifications are given. The Air Forces of All Nations are described and in most cases photographs of the Personnel and Materiel are shown. Price £2 2s. Net. From THE AEROPLANE & GENERAL PUBLISHING Co., Ltd., 61, Carey Street, W.C.2.

15 December 1920 : UK - Licences to Ground Engineers.— New, 133 Total, 478 Renewals, April 1st to Sept. 30th, 1920, 90. (This is quite satisfactory.)

06 May 1920 : FLIGHT : THE TRAINING OF R.A.F. BOYS

THE Air Ministry scheme for the entry and training of boys for the Royal Air Force is now in active operation

One examination for entry took place (under provisional regulations) in December.

future examinations will be carried out under revised regulations which have now been issued as a booklet.

The basis of the scheme for securing a suitable class of boy for training lies in close co-operation between the Royal Air Force and the local education authorities throughout the country.

It is hoped that these authorities will be prepared to nominate boys, after careful selection, to sit for the entrance examination.

Each authority may, for the present, nominate as many boys as it desires. Full information as to the scheme is being sent to the local educational authorities, and those who desire nomination are requested to apply direct to them for information.

Examinations will take place twice yearly

candidates for entry must be between the ages of 15 and 16 1/2 years.

A limited number of candidates having special claims by reason of parental service in the R.A.F. will be entered on the nomination of the Air Council provided the qualifying standard in the entrance examination is reached.

The entrance examination will occupy a single day, and the curriculum includes

mathematics and

experimental science,

English,

history,

geography and

## Notes on "Civil Aviation"

common-knowledge subjects.

Successful candidates will be attested for ten years' Regular service and two years on the Reserve.

They will receive:

1. *three years' apprenticeship training in a trade* and
2. a course of education in
  1. English,
  2. civics,
  3. practical mathematics,
  4. applied mechanics,
  5. mechanical drawing and
  6. general science.

During the period of training the boy's health and general welfare are given careful and continuous supervision.

At the end of three years qualified boys [having passed their educational and guilds exams] are promoted to leading aircraftmen, and *a certain number of exceptional promise* will be *selected for an advanced course [in what?]*. Those who qualify *at the conclusion of this latter course* will be promoted to the rank of corporal, while some may be offered cadetships to commissioned rank

06 May 1920 : FLIGHT : FUTURE OF THE AERONAUTICAL RESEARCH COMMITTEE

THE Secretary of the Air Ministry communicates the following information as to future arrangements for:

Aeronautical research and

Aeronautical education.

The whole question was considered by the Committee under the chairmanship of Sir Richard Glazebrook, K.C.B., F.R.S., appointed by the late Secretary of State for Air, Lord Weir of Eastwood [previously published]

The Committee recommend, inter alia, that

the present Advisory Committee on Aeronautics should be replaced by an Aeronautical Research Committee in connection with the Air Ministry, performing functions different from those of the Advisory Committee, including certain executive functions, and that a Department of Aeronautics should be established at the Imperial College of Science under the directorship of the Zaharoff Professor of Aviation for the provision of advanced instruction in aeronautics.

The British Aeronautical Research Committee has now been constituted with the following terms of reference :—

To advise on scientific and technical problems relating to the construction and navigation of aircraft.

To undertake and supervise such research or experimental work as is proposed to the Committee by the Air Ministry, and to invite any research work which the Committee considers to be advisable ; to carry out such work itself or to recommend by whom the work should be carried out;

To take over complete responsibility for the Air Inventions Committee and for the Accidents Committee.

To promote education in aeronautics by co-operating with the Governors of the Imperial College ;

To assist the aeronautical industry of the country by scientific advice and research, and to co-operate with any research association that may be established ;

To prepare for the approval of the Air Council a scheme of work and estimate of expenditure for the year, and to administer the funds placed at its disposal by the Air Council.

To make reports from time to time to the Air Council.

The members of the Aeronautical Research Committee are as follows :

Chairman: Professor Sir Richard T. Glazebrook, K.C.B., F R.S., physicist, holding seats of authority:

University of London,

Chair of the Zaharoff Professorship of Aviation, Imperial College, London

Director of Aviation - Imperial College of Science and Technology, London

Representing the Air Ministry departments of:

Civil Aviation:

Wing-Commander W. D. Beatty, C.B.E., A.F.C. -,

Lieut.-Col. E. Gold, D.S.O., F.R.S - Meteorology

Supply and Research:

Air-Commodore H. R. M. Brooke-Popham, C.B., CM.G., D.S.O., A.F.C., Director of Research,

Wing- Commander T. R. Cave-Brown-Cave, C.B.E. [Airships]

Representing the Imperial College of Science and Technology,

Professor Sir Richard Glazebrook, K.C.B., F R.S.,

Professor L. Bairstow, C.B.E., F.R.S., Professor of Aerodynamics;

## Notes on "Civil Aviation"

Representing the Department of Scientific and Industrial Research;

Professor Sir J. E. Petavel, K.B.E., D.Sc, F.R.S., Director, National Physical Laboratory,

Representing the Royal Aeronautical Society;

Mr. Alec Ogilvie, C.B.E.,

representing the Society of British Aircraft Constructors.

Mr H. White Smith, C.B.E., and

Mr. J. D. Siddeley, C.B.E.

Scientific representatives :

Professor Horace Lamb, M.A., D.Sc., F.R.S., Professor of Mathematics in the University of Manchester ;

Professor W. E. Dalby, M.A., D.Sc., F.R.S., Professor of Engineering in the City and Guilds Engineering College, Imperial College of Science and Technology ;

Professor B. M. Jones, M.A., Francis Mond., Professor of Aeronautical Engineering in the University of Cambridge;

Mr. G. I. Taylor, M.A., F.R.S., Lecturer in Mathematics, Trinity College, Cambridge ;

Mr. H. T. Tizard, M.A., Lecturer in Natural Science, Oriel College, Oxford ;

with Mr. J. L. Naylor, National Physical Laboratory, as Secretary, ~and

Mr. J. G. Gibson, Air Ministry, as Assistant Secretary.

Sub-committees of the main Committee will be appointed for

Accidents,

Air Inventions,

Aerodynamics,

Engines,

Meteorology, and

Navigation,

with further sub-committees as required.

The sub-committees will consist both of members of the main Committee and of other members.

Approval has been given for the provision of a grant from public funds, as recommended in the report of the above mentioned Committee, towards the cost of the Department of Aeronautics at the Imperial College of Science, and the organisation and staffing of that Department under the direction of Sir Richard Glazebrook as Zaharoff Professor of Aviation, is proceeding.

The respective responsibilities of the Air Ministry and the Department of Scientific and Industrial Research in respect of aeronautical research have been defined as follows :—

(a) The Department of Scientific and Industrial Research to be responsible for:

(b) provision for independent research for the advancement of science [even though it may ultimately tend to the advancement of aeronautics].

(b) The Air Ministry to be responsible for research, aiming exclusively at the advancement of aeronautics, except as regards:

1. work done at the National Physical Laboratory or by

2. an Aircraft Industry Research Association, if and when established with the approval of the Department of Scientific and Industrial Research.

(e) Pending the establishment of permanent machinery for general co-ordination of Government research, liaison between the two Departments at the initiation and during the progress of research to be secured by:

1. confidence, and by

2. mutual representation

on the Air Ministry Aeronautical Research Committee and the Research Association for the Aircraft Industry, if and when established with the approval of the Department of Scientific and Industrial Research

10 June 1920 : FLIGHT : formation of the Air League of the British Empire [ Gen. Seely, the President of the League] on Tuesday last, the Air League,

British which has grown out of the Aerial Empire League, is destined to play "that part and to play it worthily. The main objects to be held in view are, firstly, to educate public opinion upon the supreme importance to the Empire of air power, and to focus upon aviation, both Service and Civil, the attention

of every citizen of the United Kingdom and the Dominions overseas: in a word, to carry out that propaganda among the people without which there cannot be created the essential volume of determined public opinion without which Governments cannot be moved to do things.

In its statement of aims the League very truly observes that during the War the progress of aviation was governed by naval and military demands, and the Air Force now is a factor, and will certainly become the decisive factor, of Imperial defence. It is essential, therefore, that our air power shall be developed and organised, so that it may play its part in conjunction with the Navy and the Army. Aviation is still in almost an embryo stage, and it is essential that private enterprise should receive some measure of assistance from the State in order that new types, new methods, and greater speed, economy, efficiency and safety may result, leading to improved communications between the Mother Country and the Dominions, and the creation of a great reserve of material, experience, and personnel upon which the fighting Air Service can immediately draw in time of crisis. With these premises in view, the League has as another object to support, whatever Government may be in power, in an endeavour to maintain the lead in the air, and will strengthen its hands by placing behind it a great body of well-informed and intelligent public opinion

determined that the Empire shall not lose the safety which our incomparable Navy has hitherto assured

- to us.

Another object of the League, with which we are in the fullest accord, is to press for a complete separation of the Air Service from any species of control by the War Office, and to reinstate the Air Ministry as a Department of State, with its own Secretary of State, Council and Service. At the same time, it advocates the creation of a liaison body to ensure co-ordination between all three of the Services.

These, briefly, are the principal objects with which the League has been formed, and we venture to think they are such as will commend themselves to every intelligent citizen who has given the question of air power and the future of aerial navigation more than a moment's passing thought. The League sets out, under the happiest auspices. Among those who are

associated with it in one form or another are many who have been very intimately concerned with the building-up of aerial supremacy as we knew it at the end of the War. It has a very strong executive committee, and its\_ aims are right. Much, of course depends upon the manner in which the latter are pursued, and upon how its policy is translated into action. We feel assured, however, that there will be no lack of driving-power, and that the new League is destined to become a very powerful factor in the education of the public in the need that exists for keeping our Air Force up to a pitch of efficiency and strength commensurate with the needs of Imperial defence. It has every element in its constitution making for success, and we sincerely wish it well. [...] aeronautical engineering is finding a place

in the curricula of the public schools and of those other Universities which attach more importance to the applied sciences than to the classics. Whether Cambridge, which years ago instituted engineering studies as a part of the University course, has come into line with modern ideas and taken in aeronautics we do not know at the moment. But even if it has not already been done, it will have to come, and what could be better than that advantage should be taken of the presence of men who have had long experience of war flying to inaugurate a practical course of studies ? The chance will never occur again, once these war-wise flyers have departed from the Universities. Doubtless the authorities hold that the manner of their governance of the Universities is no business of the outsider, but in such a case of total prohibition of participation in a method of transport which will in the future be vital to civilisation, some clearer definition of the why and wherefore than has been given should certainly be forthcoming. The matter is not altogether a private one. On the contrary, it seems to be one of national importance, and concerns many more than the dons themselves and the undergraduates to whom their prohibition most directly applies. We quite appreciate that if flying were allowed it would have to be under very stringent regulations, but it should not pass the wit of the authorities to frame such rules as would make for safety and prevent abuses.

## THE INSTITUTE OF AERONAUTICAL ENGINEERS NOTICES

Council Meeting.—A meeting of the Council was held on June 1.

Appointment of Vice-President.—

Lt.-Col. J. T. C. Moore-Brabazon, M.C., M.P., M.I.Ae.E. (Hons.), has accepted the Council's invitation to become a Vice-President of the Institute.

Elections.—Honorary Member : Lt.-Col. J. B. Casqueiro, C.M.G. ; Member ; A. E. Parnacott, M.I.A.E., F.R.S.A. ; Associate Members: Major W. T. Blake, T. B. Ringwood, D. A. Jones, A.M.I.A.E., F.R.S.A., W. H. Sheahan, A. T. Cross, A.I.Ae.E.

Lectures.—The Council would like to receive proposals for lectures by members. A general outline of the proposed lectures should reach the Secretary before August 1 next, but, where possible three copies of the complete lectures should be sent before that date. Out-of-pocket expenses incurred by members delivering lectures are borne by the Institute.

October Examinations.—Members and prospective members are reminded that the latest date for entry for the October Examinations is August 31. Sub-Committees.—The following sub-committees of the Council have been formed : Accommodation Committee (to transact preliminaries in connection with selection of permanent headquarters), L. Howard-Flanders, Esq., H. B. Molesworth, Esq., F. G. Moore, Esq., and the Secretary.

Emergency Committee (to deal with matters of urgency in the absence of Council), L. Howard-Flanders, Esq., H. P. Folland, Esq., H. B. Molesworth, Esq., F. G. Moore, Esq., W. Glass, Esq., and the Secretary.

Donations received for Mrs. Lyne.—Previously acknowledged £15 6s. 6d. ; Professor Bryan, £1 is. ; W. O. Manning, Esq., £1 is. ; Frederick R. Simms, Esq., £1 is. ; S. J. V. Fill, Esq., 10s. 6d. ; Anonymous, 10s. 6d. ; T. C. Letcher, Esq., 10s. 6d. ; Group Capt. Longmore, D.S.O., £1 ; F. S. Wilkins, Esq., 10s. 6d. ; R. Rhodes, Esq., £1 is. ; Lord Foley, £2 2s. ; J. Sowrey, Esq., 10s. 6d. ; Anonymous, £1 ; Colonel Belaiew, C.B., £1 is. Total £27 6s. The Subscription List is now closed and cheques have been sent to Mrs. Lyne, who desires to express her deep gratitude to members of the Institute for their timely assistance.

DOUGLAS SHAW,

Secretary.

60, Chancery Lane, London, W.C. 2.'

## THE CANADIAN AIR FORCE

SOME little time ago we gave the broad outline of the Air Force which is being organised, and below we give some further details sent out by the Canadian Air Board.

The Government has decided upon the immediate organisation of a Canadian Air Force from among the ex-officers and airmen of the Royal Air Force resident in Canada. The Force

will be a militia, not a permanent force. Almost the whole personnel will be non-professional, and the professional personnel will be negligible in number.

The total authorised strength will probably be in the neighbourhood of 5,000. Commissions will be given to officers, and airmen will be enlisted in the usual way. It is proposed that training should be carried on at training centres which the personnel will attend, not by units, but as individuals, the training centres remaining in operation throughout the year, and individuals attending as may be arranged or directed during one month in every twenty-four, being on leave without pay at all other times. They will receive pay while on duty, and their travelling expenses to and from the training centres will be paid. .

It is considered important that the training should not only provide efficient junior officers and airmen, but that it should be as such to furnish a supply of senior officers "Qualified to take command" of larger formations in emergencies" and an opportunity will consequently be afforded to senior officers to take command of training centres for periods longer than one month, but probably not in any case exceeding six months. The undertaking of duty for such extended periods will not be compulsory. It is hoped that the same plan may be applied to the duties to be performed at Canadian Air Force Headquarters, and that a succession of officers will be found from time to time able to assume duties at Ottawa in connection, "with the administration of the Force as a whole". the training stations will be few in number. At first it may not be possible to establish more than one, but at least a second will doubtless have shortly to be added, and plans for this purpose are under consideration.

The local administration of the Force will be carried on by provincial executive committees acting without remuneration, but receiving a grant towards the expenses of maintaining an office and the payment of a secretary. Four members of the committee shall, after the first year, be elected by the officers on the active list of the Force in the province, the remaining three being nominated by the lieutenant-governor of the province, who will act as honorary president of the branch in his province. It is proposed that the active list should include only officers of such an age that they can be expected to render useful air service in war, and retirement from the active list will be compulsory for junior officers at or about the age of 30, and for the most senior officers at or about the age of 38. Further details can be obtained by those interested from the Secretary, Air Board, Ottawa.

## Memoranda

(Then follow the names of 2 Overseas Cadets granted temp. commissions, and 32 Cadets granted hon. commissions. as Sec. Lieuts.)

The following Prob. Flight Officers are granted hon. commissions. as Sec.

Lieuts. :—S. Stevens ; Jan. 13, 1919. A. C. Norcross ; Jan. 16, 1919. C. B. Symington ; Feb. 10, 1919. L. W. Smith ; Feb. 26, 1919. N. V. W. Lucas ; March 7, 1919. E. C. Phillips ; March 23, 1919. F. T. B. Snow ; April 4, 1919. A. L. Parnell ; April 7, 1919. B. L. Pelham ; Sept. 17, 1919. T. O. M. Pope ; Oct. 12, 1919.

Sec. Lieut. G. C. Oliver relinquishes his commission on account of ill-health contracted on active service, and is permitted to retain his rank ; May 29.

## Notes on "Civil Aviation"

London Gazette, June 4

### Aeronautical Instruction

MR. HOPKINS asked the Secretary of State for War and Air whether it is a fact that at the commencement of the present educational session, October 1, 1919, no course in aeronautics was available for students, either at the Imperial College, or at Cambridge, nor is available at the present time ; and whether it is the intention of the Government, in view of the inadequacy of the provision for instruction, to render financial assistance for the teaching of aeronautics at Cambridge and the East London College, or whether it is intended to exclusively confine Government assistance to the work at the Imperial College ?

Mr. Churchill: With regard to the first part of the question, there is a Chair of Aeronautical Engineering at Cambridge, and undergraduates reading for an engineering degree can study the aeronautical side of this subject. The course at the Imperial College is a post-graduate one, and though lectures have begun, the scheme will not be in full operation until the commencement of the academic year, next October. With regard to the second part, I would refer my hon. friend to the Government decisions quoted in the Report, dated December 12 last, to which I drew his attention in my reply to his question on 17th of last month. One clause of this report states that applications for assistance in these matters from any university will be considered

24 June 1920 : Canadian ?? amends the BRITISH NORTH AMERICA ACT, an Address to His Majesty, King George V.,

The Minister of Justice moved the following resolution in the House of Commons :

That a humble Address be presented to His Most Excellent Majesty the King in the following words :

To the King's Most Excellent Majesty :  
Most Gracious Sovereign :

We, Your Majesty's most dutiful and loyal subjects the Commons of Canada, in Parliament assembled, humbly approach Your Majesty praying that you may graciously be pleased to give your consent to submit a measure to the Parliament of the United Kingdom, to amend the British North America Act, 1867, in the manner following, or to the following effect "An Act to amend the British North America Act, 1867.

Be it enacted by the King's Most Excellent Majesty, by and with the advice and consent of the Lords Spiritual and Temporal, and Commons, in this present Parliament assembled, and by the authority of the same as follows :

Section ninety-one of the British North America Act, 1867, is hereby amended by adding thereto the following subsection:

"Any enactment of the Parliament of Canada otherwise within the legislative authority of the Parliament shall operate, and be deemed to have operated, "extraterritorially" according to its intention in the like manner and to the same extent as if enacted by the Parliament of the United Kingdom."

All of which we humbly pray Your Majesty to take into your favourable and gracious consideration.

The Minister of Justice (the Right Hon. C. J. Doherty) said : The entire purpose and effect of the legislation we are asking to be enacted is to give an interpretation to the provisions of the British North America Act which *will settle what is now* a "disputable or unsettled" question.

There is a jurisprudence and there are judgments which hold, or at all events, are interpreted as holding, that there is something restricted in the effect of the legislation of the Parliaments of the Dominions as compared with the effect of legislation enacted by the Parliament of the United Kingdom and the effect which attaches to legislation enacted by them.

The interpretation that we ask for is that "*it should be enacted that the legislation of this Parliament, within the scope of its attributions [it is not suggested to extend them in anyway] shall be deemed to operate extra-territorially according to its intention, in like manner and to the same effect, as if enacted by the Parliament of the United Kingdom.*"

## Notes on "Civil Aviation"

1. We are not seeking to encroach on the jurisdiction of the United Kingdom. . . .
2. Now that effect goes no further than that such law shall be law in Canada ;
3. we do not pretend that it can be enforced in foreign countries. But
4. we wish to make certain that the law imposing obligations upon the citizens of Canada to be carried out outside the limits of our own country.
5. we will be "**entitled to enforce in our courts**" whenever our citizens may return within this jurisdiction.
6. That [enforcement] is precisely "**the power attached to the legislation**" of the Imperial Parliament.

As I say:

1. it is not at all "a settled thing" that it [enforcement] "does not attach to our legislation".
2. There are "judgments" which certainly justify the conclusion that it does ;
3. there are "other judgments" that justify the conclusion that it does not.

In the absence of such settlement it would be necessary for us *in each particular case* to go to the United Kingdom to ask for "jurisdiction".

The particular matter that has brought this to our attention is the *legislation which we may be called upon to enact* and the *regulations which it may be necessary to impose to govern Canadian aerial navigation*.

Any such legislation would necessarily *have to deal with Canadian aerial navigators* [the same as naval navigators] and *the management [does this mean pilotage ?? ] of Canadian aircraft*, and [I think it is obvious] that *if doubt be suggested as to whether we [Canadian lawmakers] can enforce those laws* with regard to "the operation" of any Canadian aircraft the moment it gets outside the actual limits of Canada, we would be put in a very difficult position.

Now, it seemed to us better to settle the question once for all.

The Hon. W. S. Fielding (Liberal, Shelburne and Queen's, N.S.) asked for an illustration of what the Minister desired to control by this legislation.

The Minister of Justice replied that *there were in process of preparation certain rules of aerial navigation* which, it was expected, *under "conventions" and "treaties" to be made [the ICAN and the Treaty of Versailles], would govern the aircraft of all the different nations*.

Under those *[conventions and treaties]* it would be their obligation *[all the different nations]* to see that their aircraft and those managing it conformed to "the rules" *not only while they were actually within their country*, but when they got in the air over the ocean or over some other country.

Mr. Fielding : Up over Great Britain, for example ?

The Minister of Justice replied in the affirmative, but said that this would not exclude the authority of any country in which their men might be. There was no pretension that their law would prevail in any other country, but if their citizen came under the operation of this law he would be bound in addition to conform to such obligations as they might impose upon him as a Canadian citizen. The effect of that would be that if they did want legislation imposing certain obligations upon their citizens while they were outside this country, when those citizens returned they would be in a position to enforce those laws within Canada. The only effect would be to remove any doubt as to whether there was a difference between the effect of a Dominion law in that respect and the law of any other country.

Mr. Fielding said that the question in his mind was, if a Canadian went to England and committed some offence against these laws they laid down in England, was he to be punished when he returned to Canada ?

The Minister of Justice : If he has violated our laws which we have prescribed as a rule of conduct while he is outside of this country then when he returns he will be liable to such consequences as our legislation imposes."

Mr. Fielding : Even though he has already been punished in England ?

The Minister of Justice : "In that case I have no doubt that the rule against punishing a man twice for the same offence would apply."

This motion having been agreed to, a further motion was agreed to for sending a message to the Senate requesting their Honours to unite with the House of Commons in the Address.

### DEBATE IN THE SENATE.

In moving that the Senate do unite with the House of Commons in the said Address, on 26th June,  
The Leader of the Senate and Minister of Civil Re-establishment

## Notes on "Civil Aviation"

(Hon. Sir James Loughheed) said that the object of this was to secure Imperial legislation amending the British North America Act, whereby it would be placed beyond all controversy that the Dominion Government had authority to legislate extra-territorially. They were entering into arrangements, for instance, with the United States, to enforce regulations that might be agreed upon between the two countries respecting aerial navigation. The United States, being a sovereign Power, could exercise jurisdiction extra-territorially to enforce regulations, and persons who violated those regulations outside the United States could be punished upon their return to United States territory. It would be unfortunate if they in Canada were precluded from enforcing their regulations likewise.

The Hon. H. Bostock (Leader of the Opposition) could not see why this legislation was necessary. It seemed to him that any citizen of Canada who went outside the Dominion and infringed the law of the country could be punished when he came back if the Government thought it desirable to punish him.

The Leader of the Senate :

" Not if the offence has been committed outside of Canada."

Mr. Bostock :

" The offender can be punished when he comes back. We cannot of course punish him if he is outside our jurisdiction."

The Leader of the Senate :

"

It is not absolutely clear that we have the right, for the constitutional reasons I have pointed out."

The motion was agreed to, and on a motion of Sir James Loughheed it was resolved that an Address be presented to His Excellency the Governor-General, respectfully requesting that His Excellency would be pleased to transmit the said Joint Address to His Majesty.

### NAVAL DEFENCE OF THE EMPIRE.

On 28th June the House in Committee of Supply This debate continues the discussion (vide JOURNAL OF THE PARLIAMENTS OF THE EMPIRE, Vol. I., No. 3, page 486) following upon the statement of the Minister of Naval Service on Naval policy and the British Government's gift of ships to Canada discussed

the following item : DEBATE IN HOUSE OF COMMONS.

Mr. Michael Clark (Independent, Red Deer, Alta.) conceded that the Government had to take into their consideration the fact that they in Canada had wholeheartedly fought alongside the Old Land and other portions of the Empire through the great war [...] He wished to pay a compliment to his hon. friend the President of the Privy Council (Mr. Rowell), who seemed to be the one member of the Government who in that country had devoted himself with wholeheartedness to making Canada's contribution to the League of Nations a real success. In Great Britain the world was distinguished in having Arthur J. Balfour, of almost unparalleled experience and ability in politics, Lord Grey, whose knowledge of foreign policy was not exceeded by anyone, Lord Robert Cecil, Lord Bryce, and numbers of others of little less calibre who were working might and main to make the League a success. He thought they would have spent their time better if they had voted a sum of money for bringing their own people up to the high

mark of civilised thought upon this question, instead of devoting two and a half millions at almost the first Session of Parliament after the war was over for the buying or up-keep of vessels of warfare. If the war did anything it demonstrated the absolute fallacy of the old pagan doctrine that to prepare for war was the best way to maintain peace. If ever war could have been prevented by preparation for war then the last war surely would never have occurred. The war had demonstrated the further fact that a nation not warlike at the beginning of a war could be one of the most potent factors in the final stages of that war.

The Next War.

Against whom were they going to fight in the immediate future ? The only suggestion he had heard was that they might have a war between Japan and America. That could not possibly implicate the British Empire because Japan was their ally. They had so impoverished themselves that their difficulty now was not to supply huge armies abroad, but to feed the ordinary run of their population at home. If the vessels were up to date at the present moment, they certainly would be obsolete in five years. He wondered if the Government had taken it into their consideration that some wise men from the military point of view were already prophesying that the next war would be in the air. If the next war would be in the air, it would seem rather a useless way of meeting it by making preparations in the old way for a war on the sea. They had better make their Air Board a reality instead of a name. What was the use of building navies if their fiscal policy drove them off the ocean ? It was what it did to America and it was what it had done very largely to Canada [...] if they were to continue this loose confederation, of which all the parts were free, known as the British Empire, they would do better possibly permanently to have a system of co-operation between different parts of the Empire. Let them re-establish their financial resources, and when they met in the Imperial Conference, whoever were the representatives of Canada would enter into all these weighty considerations and would work out a system of co-operative defence which would make the Empire bigger and abler to defend itself in the future than it was in this war.

30 June 1920 : Ottawa : The estimates for the Air Service were discussed in Committee of Supply.

#### DEBATE IN HOUSE OF COMMONS.

The Minister of Militia and Acting Solicitor-General (Hon. Hugh Guthrie) said that last year they passed an Act to establish an Air Board. It so happened that they had in Canada about 12,000 of the most highly trained military airmen who were to be found in the world. A paper establishment had been authorised up to 5,000 men, including all ranks. The proposal was briefly to recruit, as far as possible, the trained men who were to be found in Canada to-day for the purpose of maintaining their interest in and sympathy with the work, in case in the future it might develop for commercial, scientific, or other purposes, as well as for military operations.

Aeroplane Outfit from Great Britain.

They had received from Great Britain a very extensive aeroplane outfit, consisting of aeroplanes, seaplanes and the necessary additional craft, the value of which he thought

amounted to between five and six million dollars. In addition to that they were acquiring certain of their own property at Vancouver as an air station, another property at Morley in the Province of Alberta, another place in the Province of Quebec at or near Lake St. John and, in addition, a small experimental station at Rockcliffe, in the City of Ottawa.

All they needed was to give a limited training to a limited number of airmen in Canada to keep their hand and their eyes in. They proposed doing this by means of Provincial Associations. In each Province of the Dominion the Lieutenant-Governor had undertaken to form a Provincial Association and to enlist as many men as he could in the service. They proposed to give these men a limited training each year, taking them to one of their training stations, there to give them one month's flying amounting to, he thought, two hours a day per man. The Objects of the Air Board.

The objects to be attained by the Air Board were not by any means all military. The expenditure on this item would be about \$800,000 for scientific, exploration and other commercial purposes. The Government of Quebec had entered into an arrangement with them, on the basis of fifty-fifty, so far as expense was concerned, for the establishment of a station in some part of Northern Quebec, near Lake St. John, for the purpose of exploration and scientific work in that province. They hoped for great results from that undertaking.

They did not propose to enter into any commercial flying as a Government undertaking, but they did propose to supervise all flying of that kind and all air routes. They proposed to license pilots, to license aircraft, to lay out routes and provide the rules and regulations. At the present time they were laying out an air route between North Bay and Winnipeg. The only thing that was necessary in regard to that, he was informed, was to see that they were getting suitable landing stations, and they were locating these upon Crown lands, which would involve no expense. Between Winnipeg and Calgary it was not necessary to have any landing-place, but from Calgary on to Vancouver it would be necessary to provide landing places, and he believed suitable sites were being located throughout the mountains. Then from Ottawa eastward to the sea it was also proposed to lay out flying routes. This was a modern development, and they intended to keep up with other nations, and particularly with the United States and Great Britain.

Gifts from the United Kingdom,

Mr. Ernest Lapointe (Liberal, Quebec East) declared that all these gifts of warships and aircraft should be accepted by the Parliament of Canada and by nobody else. Among other things the Imperial Conference next year was going to consider was the defence of the various parts of the Empire on sea, on land and in the air, and the fact that Canada, or any other Dominion, had accepted gifts from the United Kingdom meant that they might be placed in a delicate position to refuse concurrence in the plans which would be submitted to the Conference by the statesmen of the United Kingdom. The representatives from Canada and the other Dominions should go absolutely untrammelled by the acceptance of gifts or in any other way.

The Hon. Henri S. Beland (Liberal, Beauce, Que.) thought that as to exploration it was very doubtful whether they would

## Notes on "Civil Aviation"

derive any benefit from this expenditure so far as scientific purposes were concerned. The only thing for which he could see it would be of any use to the country would be the protection of their forests against fire. Now as far as military purposes were concerned the hon. Minister claimed that some service would be rendered to the country thereby. They had already gone very far in that session after the war was over both on military expenditure proper and on naval expenditure. Were they going to launch the country on expenditure for air preparation ?

30 June 1920 : Handley Page Transport : Handley Page Type O/400 Ser. No. HP-2? G-EATP ex RAF H4600 catches fire in the air over Örebro, Sweden. Engine fire due to a broken fuel line. forced landing carried out, aircraft bounced, caught fire and was destroyed.

31 June 1920 : Handley Page Transport : Handley Page Type O/400 Ser. No. HP-2? G-EAKA ex RAF crashes during T/O from a lane cut in a cornfield. Corn nearly 2m high wraps around landing gear, aircraft flips onto its back. Aircraft was a total wreck - damaged beyond repair.

Lieutenant H. R. Stewart

AFA-C Provincial Committee Executive for New Brunswick :  
Lieutenant F. S. E. MacRae.

14 July 1920 : During the past six months:

113 Licences for ground engineers have been granted in England, Total of 345 issued since May 1st, 1919.

1 Licence for engineer have been granted in England, Total of 1 issued since May 1st, 1919.

107 Certificates of airworthiness have been granted in England, Total of 325 issued since May 1st, 1919.

The Dominions, India, and the Colonies.

Arrangements are being made to secure "the greatest possible measure of uniformity" between Air Regulations of each unit of the Empire.

The "Air Navigation Bill provides for the adaptation by Order in Council to British Possessions, exclusive of the self-governing Dominions and India, of the legislation in force in this country."

India and Canada have formed Air Boards and have published Air Regulations.

**The Canadian Air Board Act was passed in January, 1919, of from five to seven members appointed by the Governor in Council.**

The duties of the Board resemble those of the Air Council in Great Britain.

A Superintendent of Flying Operations, with a seat on the Board, **"controls the licensing of personnel, aircraft, and air harbours, and is responsible for Civil Aviation conducted by private enterprise."**

An Associate Air Research Committee, formed under the Honorary Advisory Council for Scientific and Industrial Research, began its sittings on Feb. 7th, and is in close cooperation with the Air Board.

Dangerous flying was prohibited by Order in Council on July 7th, and Civil Aviation Regulations were issued on Jan. 17th last.

Experiments in photo-topographical surveying have been authorised in the Province of Quebec. src : The Aeroplane JULg 14, 1920 pg 88

08 September 1920 : light blue - the Farman colour [...] those who were in the R.F.C. in the early days will remember **the colour of the nacelles** on Henris, Longhorns and- Shorthorns.

Martin and Fagg, the two ground engineers, both of whom have had considerable flying experience before and during the war, were invalided from the Service owing to injuries received on active service.

Folkstone airdrome : Martin, Fagg and Brown, the two ground engineers and mechanic respectively, so long as sufficient encouragement is forthcoming, they may be expected to accomplish whatever they may set out to do. - The Aeroplane pg 498.

15 September 1920 : "The Department of Civil Aviation has begun the publication of a series of **notices to civilian ground engineers**. The first instalment of these appears on page 528 of this issue" Aeronautical Engineering : supplement to The Aeroplane sept 15, 1920.

september 1920 : The Aeroplane : The specifications for "Exploratory and Forest Patrol Aircraft" to be bought by the Canadian Air Board were published on Sept. 29th.

14 December 1920 : Handley Page Transport : Handley Page Type O/400 Ser. No. HP-25 G-EAMA departs Cricklewood Aerodrome in fog and was flying low when it struck trees and crashed at Golders Green, catching fire, killing 4 of the 6 passengers and both crew.

14 January 1922 : Handley Page Transport : Handley Page Type O/10 Ser. No. HP-43 G-EATN Crashes on approach to Le Bourget Airport, France killing all five on board.

10 July 1923 : Handley Page Transport : Handley Page Type W-8 Ser. No. W-8-1 G-EAPJ forced to land with engine trouble Poix, France. hit a sunken road and broke its back, damaged beyond repair.

1919-1922 : Alfred John Sutton Pippard partner in a firm of aeronautical engineers.

1919 : 1923 Alfred John Sutton Pippard associated with the experimental testing of airship structure in connection with the building of H.M.A.S R.100 and R.101 (see B.21).

1922-1928 : Alfred John Sutton Pippard - Professor of Engineering at Cardiff,

1928-1933 : Alfred John Sutton Pippard - Professor of Engineering at Bristol

23 March 1933 : Alfred John Sutton Pippard appointed to the Chair of Civil Engineering at Imperial College, London,

1914 : Alfred John Sutton Pippard receives degree in Civil Engineering, University of Bristol,

1 April 1938 : Alfred John Sutton Pippard elected to the Council the Royal Aeronautical Society

June 1954 : Alfred John Sutton Pippard elected to Fellowship of the Royal Aeronautical Society

1933 Alfred John Sutton Pippard takes up position as President - Dept. of Civil Engineering , Imperial College

published by the Technical Department, Air Ministry.

- a) The "worked-out examples" in H.B 806 refer to a particularly awkward aeroplane called the "Snag".
- b) H.B. 806 was the aircraft designer's guide to stress calculation.
- c) During the war period the "responsibility for the strength of aircraft" lay with the Government.
- d) Post WW1, the responsibility was shared between the Air Ministry and the contractor.<sup>156</sup>
- e) H.B. 806 was revised and enlarged, published as A.P.970, the bible of the designer of "Service" aircraft.
- f) 1932 : the "strength of aircraft" differences between civil and military aircraft became recognised and a separate handbook for civil aircraft, A.P.1208, was produced. (Flight - March 1939 page 227 - Airworthiness and the ARB)
- g) UK-Ministry of Defence (UK-MoD) Defence Standard (Def Stan) 00-970 Issue 1 dated 12 December 1983 Design & Airworthiness Requirements for Service Aircraft (Aeroplanes), produced on behalf of the Defence Aviation Safety Board (DASB) by Airworthiness Design Requirements and Procedures (ADRP), Air/Land Technology Group (A/LTG), MoD Abbey Wood.
- h) Aviation Publication (AvP) 970 dated 1959 Design Requirements for Service Aircraft
- i) Air Ministry Publication (AP) 970 2nd Edition dated 1924 Handbook of Strength Calculations
- j) Handbook of Strength Calculations (HB) 806 1st Edition dated 1918

06 January 1920 : UK Air Ministry Method of specifying strength:

- A. the load factor when the centre of pressure is in its most forward position : this gives, in each case, a definite load for every part of the machine, including the tail plane and the fuselage.
- B. the load factor when the centre of pressure is in the position corresponding to maximum horizontal speed at ground level : this also gives a definite loading.
- C. the factor of safety in a terminal nose dive, a condition which is again quite definite for each aircraft, the airscrews being assumed to be removed. A thru C are considered sufficient to determine the strength of the wings and of the tail plane ; also for certain loadings of the fuselage when in flight.
- D. For the strength of the fin and rudder, specification, this gives the value of an assumed lift coefficient, which, when the maximum speed of the craft is known, determines uniquely the strength required in these parts, and also, in so far as the later loadings are concerned, in the fuselage. The values assumed for the lift coefficient are considered sufficient to cover adequately the maximum forces which can be imposed on the rudder and ript by the pilot when exerting his full force so as to obtain as rapid a turn as possible.
- E. Strength of undercarriages--specification (e)--is dealt with under the conditions of both static and dynamic loads, neither case being considered sufficient by itself to meet all requirements.

For the use of the tables it should be noted that the two terms:

1. factor of safety, and
2. load factor

are defined in the accepted engineering sense :

---

<sup>156</sup> Flight - March 1939 page 227 - Airworthiness and the ARB

## Notes on "Civil Aviation"

1. Factor of safety = (Failing strength of a member of the structure / Worst possible load occurring under any condition of flight)
2. Load factor = (Failing strength of a member of the structure / Load in member under horizontal steady flight conditions)

In addition to the above it is essential (f) that, in the case of any one flying wire, or duplicate pair of wires, being removed from the aircraft, the strength of the remaining portion should be such that at least one-half of the scheduled load factors and factors of safety shall be obtained under each of the foregoing conditions. For this particular case incidence or other normally redundant bracing is naturally assumed operative where necessary.

Methods of calculation.--In using the above schedules the calculations of strength will be checked by the methods of the "Handbook (H.B.) of Strength Calculations" (H.B. 806, 2nd edition), published by the Technical Department, Air Ministry. In all calculations and in specifications of load factors and factors of safety, design figures should be employed, and not those obtained from breaking tests. Further, where dealing with steel tubes, the specifications of the Engineering Standards Committee, based on the figures for yield points, are approved for stress calculation purposes; for stream line wires the breaking load should be taken in preference to the yield point, which is, in these cases, ill defined. Redundant wires, except as mentioned in (f), are to be considered as neglected.

With a view to facilitating the use of the schedule the following additional matter should be noted :—

1. That for (a) and (b) the positions of the centre of pressure should preferably be determined by a test on a model with a 6-in. chord at 60 ft/sec., but that the Air Ministry might agree to issue a certificate based on results for a monoplane model of 3-in. chord tested at 40 ft/sec. For biplanes, a biplane test is preferred; similarly for triplanes. For case (b) the maximum horizontal speed at ground level should be obtained from the formulae given in § (2) below. From this speed the value of the lift coefficient is obtained and the position of the centre of pressure determined from model tests as defined above.
2. That for (b) and (d) the maximum speed at ground level should be defined by the following formula, giving the maximum speed for given loadings and weight of aircraft (should the manufacturer desire to specify the maximum speed in any other manner, he is at liberty to make a special application) :

**1920 : British Dept. of Defense - Ministry of Munitions creates "Disposals Board" to dispose of "War Assets".**

1920 : Entire stock of surplus aviation items sold to the Imperial and Foreign Corp. Ltd (I&FCL), I&FCL transfer 10,000 airframes, 30,000 aero-engines and spares to the "Aircraft Disposal Co. (ADC) for £1,000,000.00.

07 October - 17 October 1920 : Air Board / CAF Trans Canada flight from Dartmouth NS to Victoria BC.

1920 : Air Board aircraft being worked to death: Pilots worried about shrinkage in wood of Spars in Main planes of WW1 era aircraft. Source ref : TSB documented - Brace for Impact: Air Crashes and Aviation Safety By Peter Pigott

17 January 1920 : Canada Air Board issued Air Regulations for 1920 come into effect, establishing a set of air regulations that required all pilots, air engineers, and aircraft to be licensed with the Air Board. also empowered the "Air Board" to conduct flying operations using government-owned aircraft, and to form the first true CAF post WW1. The first chairman of the board, Colonel Oliver Mowat Biggar, Judge Advocate-General, & Vice-Chairman brought to his duties much knowledge of overseas air policies gained while attending the Paris Peace Conference as a Canadian delegate;

1920 : The Canadian Air Force was re-constituted in 1920 and the officer in command (Air Commodore Tylee) held the title of Air Officer Commanding. It was also from 1920 to 1922 that Air Vice-Marshal Sir Willoughby Gwatkin served as Inspector-General of the Canadian Air Force although formally command was held by Tylee.

Air Commodore Arthur Kellam Tylee OBE (24 April 1887 – 13 April 1961) was Canadian officer who served in the Royal Flying Corps during World War I. After the War, Tylee was the first Air Officer Commanding of the Canadian Air Force.

Career

Tylee was born on 24 April 1887 in Lennoxville, Quebec,[1] the son of Arthur Mailland Tylee and his wife Harriet F. Kellam.[2] Tylee later studied at the Massachusetts Institute of Technology[3] from around 1910[4] to 1913.[5]

Tylee joined the Royal Flying Corps in August 1915,[3] being granted the probationary rank of second lieutenant in December of that year; he had previously held the rank of lieutenant in the Canadian Militia.[6] At least some of his junior years in the RFC were spent flying the Martinsyde G.100 on No. 23 Squadron on the Western Front.[7] Tylee was made a flight commander in

## Notes on "Civil Aviation"

February 1917[8] and in March he was made a squadron commander and given the temporary rank of major.[9] It was also in 1917 that Tylee was sent back to Canada, to command Camp Borden in Ontario before being posted to England to carry out advanced work.[3] On 1 April 1918 Tylee was transferred from the Royal Flying Corps to the newly created Royal Air Force in the temporary rank of lieutenant colonel[10] and returned to Canada to serve as the Inspector of Training for the Royal Air Force in Canada. He continued in this role until the end of World War I.[3] In June 1918 Tylee was mentioned in dispatches for valuable war service[11] and he was also made an officer of the Order of the British Empire.[3]

After the War, Tylee returned to Canada. By 1920 Tylee was selected to be the first Air Officer Commanding the Canadian Air Force and granted the rank of air commodore. Tylee established a small headquarters at Ottawa under the oversight of the Air Board[12] on which Air Vice-Marshal Sir Willoughby Gwatkin served. In October 1920 Tylee, accompanied by Flight Lieutenant George Thompson, set out to complete the last leg of the first trans-Canadian flight (which had started in Halifax in July), departing from Calgary in a de Havilland DH-9A. They arrived in Vancouver after 4 days of flying.[13] In February 1921 Tylee turned his attention to the matter of what might make a suitable flag for the Canadian Air Force. In a note he wrote to Gwatkin, Tylee proposed that the RAF Ensign be adopted with a maple leaf at the centre of the roundel. Gwatkin in turn applied to Air Marshal Sir Hugh Trenchard, the British Chief of the Air Staff, who rejected the proposal on the basis that "the sentiment of unity between the Air Services of the Empire" ought to be maintained. It was not until 1940 that Tylee's proposed design was adopted.[14] Later in 1921 Tylee was replaced as commander of the Canadian Air Force by Wing Commander Ronald Redpath[15] Tylee died on 13 April 1961 and was buried in the Compton Cemetery in Quebec.[1]

Tylee's successors, not being air officers, only held the title of Officer Commanding. In 1922, the senior Air Force post was redesignated as the Director and in 1924, when the Canadian Air Force was granted its Royal prefix, the officer appointed to command the Air Force continued to hold the title of Director. From 1932 to 1938 the title of Senior Air Officer was used. In late 1938, the Air Force became an independent service and its professional head was retitled Chief of the Air Staff, bringing the Canadian higher command arrangements and nomenclature into line with that of the British and Australian air forces.

January 1920 : RNAS-C Dartmouth now Canadian Air Board entity, performs civil and service flying duties.

18 February 1920 : Ottawa, Order-in-Council authorized a new, part-time, non-permanent CAF (a militia arm within the Air Board Sir Willoughby Gwatkin became the first Inspector General of the Canadian Air Force in April 1920 with Air Commodore A. K. Tylee appointed as air officer commanding. William Lyon Mackenzie King : "Where does the Minister expect invasion from? ... defence against whom[?]") a non-permanent service with a provisional establishment of 1,340 officers and 3,905 airmen to work alongside the civil aviation division under the control of the Air Board. Initially, the Canadian Air Force adapted regulations from the Royal Air Force (RAF). The Canadian Air Force chain of command for the first air officer commanding was a relatively direct line through the inspector general to the Air Board. the initial cadre of Canadian Air Force officers and enlisted men were considered "in continuous service but on inactive, unpaid leave" except when on refresher training. rank structure laid down for the Canadian Air Force included: air vice-marshal, air commodore, group captain, wing commander, squadron leader, flight lieutenant, flying officer, pilot officer, warrant officer, flight sergeant, sergeant, corporal, air mechanic (1st class) and air mechanic (2nd class). (The use of Military Equivalent of Canadian Air Force ranks will be discontinued throughout the Service forthwith and only the ranks hereunder quoted (i.e., group captain to pilot officer) will be used both in correspondence and conversation." - Camp Borden, routine order, 28 November 1922)

**An air officer is an air force officer of the rank of air commodore or higher.[1] Such officers may be termed "officers of air rank".[2] While the term originated in the Royal Air Force, air officers are also to be found in many Commonwealth nations who have a similar rank structure to the RAF.**

**Air officers holding command appointments receive the title Air Officer Commanding (AOC), whereas air officers holding commander-in-chief positions are titled as Air Officer Commanding-in-Chief (AOC-in-C).**

### British usage

**In the British Armed Forces, where the term originated, an air officer is equivalent in concept to flag officer and general officer in the Royal Navy and Army respectively. Specifically while the Army uses General Officer Commanding (GOC), the Air Force uses Air Officer Commanding (AOC) to designate the senior officer in a formation.[3]**

**Note, however, that in the British Armed Forces, while an air commodore is an air officer,[4] his Royal Navy equivalent (commodore) is not considered a flag officer, nor is his British Army or Royal Marines equivalent (brigadier) considered a general officer. In 1919 when the RAF introduced its own air officer ranks, the preceding RAF and equivalent army rank was brigadier-general, which was a general officer rank until its abolition in 1922. In some other countries, most notably the armed forces of the United States, army, air force and marine corps one-star officers are considered to be general officers, and one-star officers of the navy and coast guard are considered to be flag officers.**

## Notes on “Civil Aviation”

There are multiple air officer command appointments. Additionally the RAF maintains two home country air officer appointments. These are Air Officer Scotland[5] and the Air Officer for Wales.[6]  
On ceremonial occasions many RAF air officers are entitled to wear embellished shoulder boards and the gold and blue sash. This applies to all officers at or above the rank of air vice-marshal and holders of the following air commodore posts:

- Commandant of the Royal Air Force College Cranwell
- Air Officer Scotland and Northern Ireland
- Air Officer Wales

With the exception of marshals of the RAF, the embellished shoulder boards feature the golden air officers' eagle and wreath device surmounted by a lion statant guardant. For marshals of the RAF, the embellished shoulder boards display the air officer's eagle and wreath, two crossed marshal's batons and, since the coronation of Queen Elizabeth II, the St Edward's Crown representing royal authority.[7] Prior to 1953, the Tudor Crown (sometimes called the King's Crown) was used.

Air officer ranks

The air officer ranks are as follows: Marshal of the Air Force

Air chief marshal

Air marshal

Air vice-marshal

Air commodore

Royal Flying Corps

Director-General of Military Aeronautics

- 1914–1917 – Lieutenant-General Sir David Henderson
- 1917–1918 – Major-General John Salmond
- 1918 – Brigadier-General Edward Ellington

General Officer Commanding the Royal Flying Corps in France

- 1914–1915 – Major-General Sir David Henderson
- 1915–1918 – Major-General Hugh Trenchard
- 1918 – Major-General John Salmond

Royal Naval Air Service

Heads of the RNAS

- 1914–1915 – Captain Murray Sueter, Director of the Admiralty Air Department
- 1915–1917 – Rear Admiral Charles Vaughan-Lee, Director of the Admiralty Air Department
- 1917–1918 – Commodore Godfrey Paine, Fifth Sea Lord and Director of Naval Aviation

18 March 1920 : Airco DH.16 G-EACT operated by Aircraft Transport & Travel Airco crashes into the English Channel off Beachy Head; the pilot is rescued by a ship.

29 March 1920 : Nieuport Delage 30T F-CGTI crashes at Lympe.

20 April 1920 : Robert McCombie issued with the first Canadian “Air Engineer” license.

20 April 1920 : Curtis JN-4 owned by Aerial Service Co. Regina Sask. issued with the first C of R in Canada. This aircraft was however registered with British markings : G-CAAA.

23 May 1920 : Outgoing PM Borden authorises a budget of \$1.6 million for continued operation of the Air Board. William Lyon MacKenzie is quoted as saying “a waste of funds, Gov’t doesn’t need race car drivers, lion tamers and acrobats : all of whom are in safer professions. Why should it extend this courtesy to aviators?”

9 July 1920 : Shorts Bros. build and display the highly polished “Swallow” (later re-named “Silver Streak”) monocoque fuselage bi-plane at the Olympia Air Show.

- a) First all Duralumin aircraft built in the UK.
- b) no wood or fabric was used.
- c) The structure of each wing was made up of two steel tube spars with duralumin ribs “sweated on”.
- d) The wings and tail were skinned with sheet aluminum riveted to their respective frames.
- e) The fuselage frames had an oval cross section and were made of duralumin with channel section stringers.
- f) Duralumin sheets were riveted to the duralumin airframe to make up the aircraft’s skin.
- g) Thicker duralumin sheets were used around the cockpit.
- h) the front of the fuselage was enclosed by a single duralumin sheet, making a fireproof bulkhead.
- i) The Air Ministry refuse to issue a Certificate of Airworthiness to the Swallow. (<http://oldmachinepress.com/2014/04/>)
- j) powered by a water-cooled, 240 hp (179 kW), straight, six-cylinder Siddeley Puma engine.
- k) designed for a pilot and 400 lb (181 kg) of cargo in front of the cockpit.

## Notes on “Civil Aviation”

- l) modifications would easily allow the aircraft to carry a passenger in place of the cargo.
- m) wingspan of 37 ft 6 in (11.4 m)
- n) length of 26 ft 5 in (8.1 m).
- o) empty weight of 1,865 lb (846 kg)
- p) loaded weight of 2,870 lb (1,302 kg).
- q) max speed was 125 mph (201 km/h).
- r) 450 mile (724 km) range.

31 July 1920 : Reginald Groome issued with the first commercial Canadian Pilot's Lic.

14 August 1920 : First flight of B-1 sea-plane from Lake Union, Wa to Victoria, BC.

20 August 1920 : UK Air Ministry flight tests Shorts Bros. “Swallow”, by John Parker . renamed “Silver Streak”. The thin aluminum wing and tail skins were found to lack the needed strength and were replaced with duralumin sheeting

1920 : Jericho, BC - first Canadian Air Base, Jericho Beach Flying Boat Station, No.1 (Operations) Squadron operates 5 ea HS2L Flying Boats G-CYEB (ex USNAS A1985)

1920 : Canadian Air Force establishes No.2 Operations Squadron at High River Alberta, operating DH-4 types. DH4 G-CYCW (ex RAF F2713) single seat.

March 1920 : RAF strength 25 Sqns

07 October 1920 : The first Trans-Canada flight departs Halifax (Fairey seaplane) At Winnipeg the seaplanes and flying boats used throughout the eastern leg of the journey were replaced by three DH9s

15 October 1920: International Air-Mail contract awarded to Eddie Hubbard - Hubbard uses Boeing B-1 and routinely flies B-1 sea-plane btwn Lake Union, Wa. & Victoria / Vancouver, BC over the next 8 years.

17 October 1920 :Air Commodore A.K. Tylee of the Canadian Air Board and his crew aboard the sole DeHavilland D-H-9-A biplane to arrive Minoru field, Richmond, BC. The crossing took eleven days, but time in the air was just 45 hours. - Vancouver Sun.

1920 : R.J. Groome became Canada's first “commercial” pilot

1920 : Canada's first aerodrome opened at Regina

1920 : George Gorman teams with the May bros., forming “May-Gorman Airplanes Ltd”.

1920 : Wilfred “Wop” qualifies for a Dominion flying license. Commercial License #7

1920 : George Gorman qualified for a Dominion flying license. Commercial License #8.

1920 : Pete Derbyshire qualified for a Dominion Air Engineer, receives Canada Air Engineer Certificate #6.

1920 : the first aerial survey of Canada was completed<sup>157</sup>

1920 : Commercial flying started<sup>158</sup>

1920 : American Bar Association executive forms a Special Committee for review into the Laws of Aviation.

1920 : The Laurentide Paper Company (LPC) and LPC pilot W. Ray Maxwell form Laurentide Air Service Ltd

June 1920 : The Laurentide Co. Ltd., operate Curtiss MF Seagull flying boat G-CADL and Curtiss HS-2L flying boat G-CAAC

18 August 1920 : Aircraft accident at English Bay -Vancouver BC. Court of Enquiry. Pilot Hibbart B Brenton (ex RNAS WW1) - Killed, Aircraft type : Boeing flying boat, flipped (on landing?) while pilot attempted to qualify for a commercial license in the evening. 6:30 pm - taxiid from False creek, toom off circled false bay and landed, 7:00 pm repeated flight, climbed to 1,000 ft. On landing went into steep descent and turn into a half loop, explosions (2) heard and smoke witnessed coming from the Hall-Scott engine, Pilot seen to fall from aircraft's cockpit, aircraft then crashed into the water. wreckage later pulled to shore, pilot's body later recovered - one glove missing. Newspapers : 5000 persons estimated as witnessing the event from the shore. BOI convened of 3 CAF officers (Maj. A.M Lester, Sq. Cmrd C.M Cudmore, Lt. W. Templeton), 6 witnesses called, aircraft owners (1 -Aircraft manufacturers Ltd and 2 - the Hoffar Motor Boat Co - which had just serviced the aircraft) wreckage inspected: no mechanical problem (??) August 10 BOI finding : Pilot's glove caught in elevator control cables and caused the crash. No records survive in Ottawa.

1920 : Ex-Royal Naval Air Service (RNAS) and Royal Air Force (RAF) pilots fly war-surplus aircraft in Northern Ontario.

---

<sup>157</sup> By the Canadian Air Service (Air Board) for the South Labrador Pulp and Paper Company, Limited (Ltd)

<sup>158</sup> Laurentide Paper Company requests two Curtiss HS-2L aircraft from the St. Maurice Forestry Protection Association (Quebec) to fly fire patrols.

## Notes on "Civil Aviation"

January 1920: first Canadian AIR Engineer's certificate (Mr. Geordie Doan ?) and first Canadian commercial aircraft (Curtis HS2-L) registered.<sup>159</sup>

January 1920.160 Ray Maxwell & Geordie Doan make the first flight from Remi Lake (near Kapuskasing) to James Bay to Moose Factory, Ontario.

January-February 1920 : Ray Maxwell & Geordie Doan make first ambulance flight in northern Canada 11 days later.

28 January 1920 : John McNeill, Peter McArthur, Captain Keith Tailyour, E. Owens and R. L. Greene form the "Edmonton Airplane Company". Avro Aero type.

2 July 1920 : First woman commercial air passenger in Alberta, "Edmonton Airplane Company" pilot Tailyour flies a Mrs. M.R. Jennings to Calgary (2hr.30min)

15-17 October, 1920 : first commercial passenger flight<sup>161</sup>

1920 : Price Brothers and Company, Quebec - float-equipped JN-4 and 3x Martinsyde Type A

28 January 1920 : No 1 Squadron CAF (UK) disbanded, ordered to cease flying and to package all aircraft / equipment for shipment to Canada

5 February 1920 : No 2 Squadron CAF (UK) disbanded, ordered to cease flying and to package all aircraft / equipment for shipment to Canada

5 February 1920 : No. 1 Wing CAF (UK) disbanded

5 August 1920 : directorate of Air Services - Canada, disbanded - ending Canada's second attempt at creating a national air force.

31 August 1920 : Regulations for the Canadian Air Force are approved by the Governor in Council under Section of the Air Board Act, 9-10, George V, Chapter 11 - Presented by Hon. Mr. Guthrie. February 28, 1921 <sup>162</sup>

Curtiss HS-2L flying boat G-CYDT  
Curtiss HS-2L flying boat G-CYDS (Burnt at Jericho Beach 08 August 1921)

## Notes on "Civil Aviation"

1920 : British Air Ministry declares new route : "Cape to Cairo".

06 January 1920 : Heavier-than-air craft are now used for a variety of purposes. Heavier-than-air craft have, therefore, been divided into two classes having regard to the different qualities of airworthiness required. This separation will necessitate the granting of two distinct types of certificates. The strength necessary for safety is different in the two classes.

- I. Aircraft in the "Commercial" class includes craft used for strictly commercial work, involving only straight flying. The lower "Commercial" specification is commercially desirable since an increase of load factor involves a decrease in the range and load-carrying capacity, and need not be so exacting in order to ensure adequate safety. Stunt flying of "Commercial" aircraft of any kind is prohibited.
- II. Aircraft in the "General" and Stunt class shall be sufficiently strong to allow stunt flying of all descriptions so this class must be exacting in order to ensure adequate safety.

The schedule below is given in tabular form under these two classes. it is not intended that the schedule should be made applicable to machines already approved or designs submitted prior to some future date to be fixed by the Air Ministry. In preparing this schedule, the Load Factors Sub-Committee of the Advisory Committee for Aeronautics considered only future designs; Further revision of the present schedule from time to time will doubtless be necessary in order that it may remain in accordance with the demands arising from improvements in the constructional methods and design.

Methods of calculation.

In using the schedules, the calculations of strength will be checked by the methods of the Handbook of Strength Calculations (H.B. 806, 2nd edition) published by the Technical Department, Air Ministry.

In all calculations and in specifications of load factors and factors of safety, design figures should be employed, and not those obtained from breaking tests.

Where dealing with steel tubes, the specifications of the Engineering Standards Committee, based on the figures for yield points, are approved for stress calculation purposes;

for stream line wires the breaking load should be taken in preference to the yield point, which is, in these cases, ill defined.

Redundant wires, except as mentioned, are to be considered as neglected. (REPORT OF THE LOAD FACTORS SUB-COMMITTEE "SCHEDULE OF LOAD FACTORS FOR HEAVIER-THAN-AIR CRAFT" Reports and Memoranda, No. 673, 1920)

27 November 1920 : The Aeroplane - London Gazette published : Flying Branch—Flight Lt. J. A. Barron, from half-pay list (Scale B), to be seconded for duty under the Canadian Air Board, Nov. 27th

30 December 1920 : src - flight pg 1306 : In a recent issue of the Birmingham Post there appeared a very interesting interview, on the subject of the Universities and aviation, with Professor Lea, Professor of Civil Engineering at the Birmingham University. He pointed out that, after all, aeronautical engineering can only be based upon those fundamental principles which are common to all branches of engineering.

The fundamental courses provided in the Universities give this basic instruction, but even the many subjects which are included do not encompass the whole problem. There is, he said, one particular section of the subject which cannot be dealt with in an adequate manner. This relates to the determination of the external forces acting upon aeroplanes and the particular shapes which must be given to wings and bodies so as to obtain maximum lift at any particular speed, the greatest degree of suitability, and at the same time the minimum resistance to friction and other aerodynamic losses.

In this country the only places where such experiments could be carried out are the National Physical Laboratory, the R.A.F. establishment at Farnborough, and in certain of the large aircraft factories in which wind tunnels had been installed during the War.

No University, said the professor, can take up this part of the subject without installing very expensive plant and setting apart special members of the staff to carry out essential research. The whole matter seems to be one of endowment.

Agreed that none of the Universities, with the exception possibly of Oxford and Cambridge, which are not so closely interested in scientific research of the kind as the younger and more technical foundations, can afford the expense. Nor can we expect that the State should come forward to find the necessary funds.

One way and another, the question seems hedged about with difficulties. If there were in existence a great and flourishing aircraft industry, we should say without hesitation that it was the duty of that industry, from motives of self-interest alone apart from other considerations, to find the money for the research work which still remains, and will always remain, to be done. But the industry at the moment is neither great nor flourishing, and the present prospects of equipping the Universities are not encouraging. It would really seem to be a matter for private munificence—another Sir Basil Zaharoff is needed to step into the breach. If this country is to maintain its position in aeronautics, all the research work possible must be carried out, and the more experiment and research is multiplied over a number of centres the better it will be for the future of the industry - But how is it to be done ?

## Notes on “Civil Aviation”

15 DEC 1920 : The Air Ministry's Half-Yearly Report.

The Air Ministry's report on "The Progress of Civil Aviation" for the half-year April 1st, 1920, to Sept. 30th, 1920, was published on Dec. 10th, Licences to Ground Engineers.—New, 133 ; Total, 478 ; Renewals, April 1st to Sept. 30th, 1920, 90. (This is quite satisfactory.)

31 December 1920 ; Royal Aeronautical society report and discussion on Ground Engineering <sup>163</sup> : “Ground engineering is in an experimental stage and awaiting its certificate of approval”

Results of Air Ministry GROUND ENGINEERS Examinations, 1920 - UK			
License Categories applied for	Total Applications	No. Failed.	No. Passed.
A Only	156	17	139
B Only	4	2	2
C Only	161	31	130
D Only	14	2	12
A & C	45	9	36
A - C - D	20	2	18
A & B	109	33	76
A - B - C	4	4	7
C & D	121	40	81
B-C-D			
B & C			
A - B - C - D	23	15	8
	657	155	509
Total number of ground engineers licensed to 31/12/20 ... 509 The percentage of ground engineers operating <i>and “under supervision”</i> during 1920 is 26%			

The question of the certification of ground engineers is one which gives rise to several problems at the end of 1920:

1. It was suggested that under the existing conditions “it is a simple matter for a man to receive a ground engineer's certificate who had had none of the practical experience of aircraft”. Practical experience of aircraft being considered essential.
2. It was felt that a high standard of *knowledge of the art of aviation* [meaning “flying”] is more important, perhaps, than the standard of knowledge of engineers on a ship.
3. Up to now attaining practical training and experience presents difficulties.
  1. Men who have been through the shops are possibly inclined to be pedantic with shop practice,
  2. Men who have only outdoor experience are not sufficiently familiar with the best methods as applied in the shops.

## Notes on "Civil Aviation"

4. It would appear that if many of the fine mechanics who graduated in the Flying Corps had an opportunity of further training in workshops and vice versa, there would be a blend of knowledge which might be useful for future working.
5. *The education of future ground engineers is now receiving consideration, and opportunity is being given in universities and elsewhere for furthering his knowledge.*
6. in particular, *it is reasonable to expect that in time many valuable ground engineers will be drawn from the young men now being trained in the well-equipped establishments being set up for the Royal Air Force.*
7. The inspection of ground engineers [to ensure they are doing their work correctly] and [the quality of, and documenting of] their work is a question which is closely bound up with insurance.
8. It is well known that *the airworthy certificate was a minimum*, whereas *certification should be classified* as is done in all forms of insurance.
9. It was pointed out that a Government department *should not be the only supervisors of ground engineers* because:
  1. Government are unable to give a classification, and
  2. Government are not in a position to state, without some legal ceremony, that "one concern [business] is better than another"
  3. Government can only hold to the letter of the law and classify machines as fit to fly.
  4. Efforts have been made and conferences held with the aeronautical inspection directorate to see if a way could be found to alter this, but it had been found to be impossible.
10. It is felt that possibly a beginning could be made by the creation of a civil organisation to be a secondary source of supervision - which in due course would be run on the same lines as is done in the case of shipping. In this connection a start had been made with an aircraft register and a pilots' register at Lloyds.
11. Had the time arrived when a modest beginning might be made by the appointment of, say, one or two inspectors at terminal aerodromes, independent in their [Government] duties and responsible to Lloyds, to whom their reports would be presented? From their reports to Lloyds it would be possible to determine:
  1. the various risks represented by machines built / maintained / flown by the various organisations, and
  2. the efficiency of the various organisations staff, and
  3. the skill of the pilots employed by the various organisations.all of which would allow for the various organisations to be classified by Lloyd's.
12. Drew attention to the cases mentioned by Colonel Outram where ground engineers' work had been found to be faulty.
13. Would like to know the further remarks as to the actions taken where a ground engineers' work had been found to be faulty.
14. There is no doubt that faulty or careless work on the part of ground engineers may very reasonably lead to accidents which does considerable harm to the cause of civil aviation.

Brigadier-General R. K. Bagnall Wild : [speaking from his military point of view?]

1. As of the end of 1920, the subject of the ground engineer had not been sufficiently ventilated. [reviewed, studied, understood]
2. Technical details [on the Ground Engineer and Ground Engineering] might form a useful appendix for Colonel Outram's paper.
3. Many aircraft owners / operators / manufacturers fail to realise the extent and responsible nature of the ground engineer's work,
4. was sure a [large] number of pilots were hardly aware [clueless] of *the amount of care and attention the ground engineer gives to an aircraft*
5. Larger companies should shortly have a super-ground engineer of higher capabilities, such as "aerodrome manager", to "look after the rank and file".
6. It has been stated [both by pilots and by owners and company persons] that *apart from the safety of the public* :
  1. *"the ground engineer was an expensive luxury"*, but many also remarked that
  2. *"where the ground engineers' work has been good the money spent on them has been saved more than ten times in cost of repairs and fuel per passenger-mile alone"* .
7. Lloyds should, at an early date, start with one or two inspectors and consider the claim of any operating firm for a rebate off insurance premiums. Many firms ought to get insurance terms at *half and sometimes a quarter the present rates*, but *cannot expect this unless their ground engineers' work is sound and their advice acted on*.
